In the 1990s, the public journalism movement extended Dewey's argument of emancipated audience members and postulated that journalism must take audience members seriously and act as a public steward that engages citizens by listening and talking to them. The movement was marked by protagonists such as Jay Rosen and Davis "Buzz" Merritt. Public journalism sensed that the distance between journalism and audiences, often enforced by journalists to protect their professional integrity and objectivity, had gone too far. While public journalism as a movement ebbed out in the early 2000s, it found new lifeblood in the mid-2010s. On the same premises as public journalism, a new wave of journalistic organizations articulated that audience engagement was imperative for sustaining media. This came at a time where it was becoming clear that the infrastructural grasp of technology companies, in which journalistic organizations compete for attention against a variety of other actors, must pursue more interactive strategies. "Engaged journalism," also referred to as *engagement journalism*, manifested itself in journalistic and journalism-adjacent jobs at media outlets critically emphasizing interacting with audience members. The participatory paradigm involves, as Jay Rosen famously stated in 2006, the people "formerly known as the

audience” (para. 1) assuming more prominent positions in society, and the decline of journalistic power and authority over what is published, prominently documented in Axel Bruns’ reconceptualization of journalism’s former role of “gate-keeping” now relegated to what he calls “gatewatching.” This shift toward more civic-minded forms of participation in media is mirrored in democratic theories, most prominently Jürgen Habermas’ concepts of the “public sphere” and of “deliberative democracy,” and his book “The Structural Transformation of the Public Sphere,” originally published in the German language in 1962. Habermas argues that in a public sphere, rational discourse and deliberation about political ideas can evolve. The notion of deliberative democracy has received ample attention in thinking of political participation and communication, particularly in public spaces online such as on social media platforms or in the comment forums of news outlets.

Pathologies of the Media

Media are critical platforms for liberal democracies. They are also under attack, facing interconnected crises in the realms of politics, of trust and literacy, of epistemic authority, of information quality and veracity, as well as of infrastructure.

The *political realm* confronts media with crises of simplification and populism, in which explanations commensurate to the complexities of the world have little to no currency when competing with seemingly simple solutions rooted in a politics of alienation and tribalism, othering and hate. Populism and political polarization as well as divisive culture wars can drive wedges into society that can be difficult, if not impossible, to heal. Individualism as a prime pathology of capitalism hinders empathy and shared responsibilities in political systems. This is accompanied by politics of institutional destabilization, and attacks on the press that are typical of democracies under stress. The “fake news” narratives popular among populist politicians are semantic moves intended to sow discord and distrust of media and to destabilize societies. When media are vilified, this makes it easier for governments to shape and reconfigure laws that repress speakers and make media production more difficult, including the blocking of

certain sites and platforms, the political overtaking of previously independent public service media, or the expansion of defamation laws that can make media outlets go under. Independent media are under attack, not only in authoritarian regimes such as Turkey, Russia, or China, but, by way of countries such as Hungary, within the very heart of the European Union—a political and economic bloc priding itself on its democratic values. As political actors seek to silence journalists, tragedies such as the killing of Saudi Arabian dissident and columnist for *The Washington Post*, Jamal Khashoggi, in the Saudi consulate in Istanbul in 2018, at the hands of Saudi government handlers paint a dark picture of press freedom worldwide.

As media outlets fight over attention, their role as authorities over the veracity of content and truth is increasingly getting challenged. Outlets that were once able to provide guidance and stewardship in information ecosystems compete for attention with a multitude of other actors, both benign and malign: Citizens, governments, private corporations, partisan media outlets, entertainment industry actors, and more. Crises of trust are accompanied by crises of media literacy: A large number of media actors, some providing truthful information, some not, complicates people’s abilities to distinguish who remains a trustworthy informational actor.

In her book “The Origins of Totalitarianism,” published in 1976, German-American philosopher Hannah Arendt discusses the imminent dangers of societies in which propaganda exerts influence—it becomes difficult to know what is true and what is not. Indeed, as disinformation flourishes, this brings up the very real question of whether and to what extent media are able to maintain authority over truth and report on information of public interest. In 1988, Edward S. Herman and Noam Chomsky published “Manufacturing Consent: The Political Economy of the Mass Media,” a book which is often referenced for coining the “propaganda model.” Such a model assumes that commercial mass media are compounding economic interests and exert control over people through propaganda. Indeed, the commercial nature of many media systems itself is party to the problems that endanger the media as of 2021.

Pathologies of media also surface on an infrastructural level. Commercial media systems

without incentives for public interest journalism are under pressure to compete in attention economies in which the most divisive content reigns supreme. News media are infrastructurally somewhat dependent on disseminating content through social media platforms. This, too, means having to compete with content ranging from the most entertaining to the most outrageous. When platforms deprioritize news content over other information, news distribution becomes more precarious. Furthermore, funding models rooted in profit maximization can ultimately lead to the death of newspapers that then leave behind news deserts.

This entry considered the relationship between liberal democracy and the media from a variety of angles, tracing its history conceptually and bridging into contemporary threats to and pathologies of media. Information plays a crucial role in creating and engaging an informed citizenry, and independent media have long acted in this capacity, as check and balance for both private and public actors. This manifests in how freedom of expression and of the media are centrally expressed values in liberal democracies. As societies have shifted into informational paradigms of high connectivity, the term mediatization acknowledges the role that media have in permeating society and in shaping communication. This entry further referenced snapshots in history to examine the evolution of liberal thought regarding freedom of expression and the press in the Western world. Subsequently, the relationships between the media and the state were discussed by looking at different roles envisioned for journalism to assume in democratic societies, and the market and public interest principles that influence media. As communication has shifted toward online platforms of various kinds, the role of the audience in relation to media has changed as well. Consequently, media rearticulate their role in society and redevelop and strengthen relationships with audiences in increasingly competitive attention economies. Lastly, this entry described pathologies of media in different realms. When democratic systems crumble, independent media are at risk. Political threats bring on a destabilization of media as an institution and challenge their authority. Infrastructures such as social media platforms render news media as one of many actors who must vie for attention among entertaining as well as divisive content,

including propaganda and disinformation. This is accompanied by crises of media literacy, and of increasing difficulties in assessing the veracity and provenance of information. Some believe it remains imperative to acknowledge the important role that media play in liberal democracy and to protect independent media from imminent threats of which there are many.

DESIGN AND LAYOUT, MAGAZINE

Magazine design is the technical and artistic process of selecting and arranging elements in magazine layouts. Design and layout are essential parts of the magazine planning and production processes. Using relevant approaches to page layout, art directors and magazine designers establish credibility, appeal to consumers, and guide the audience through stories and other published content. Functional and visually interesting design attracts readers and keeps them engaged. The design of feature stories, news articles, tables of contents, covers, pull quotes, illustrations, and other types of (and parts of) layouts helps set a magazine apart from others. This entry explains the principles underlying magazine design and

reviews the historic contributions of movements, individual designers, and technical innovations leading to the practice of design in today's digital media environment.

Those involved in the design and layout process apply appropriate use of color, typography, photography, and design considerations (e.g., balancing consistency and contrast) to produce a publication that matches its branding and purpose. Art directors use design principles such as alignment to produce functional layouts in a grid, while others break out of the grid and design in a less structured manner. They also consider balance, hierarchy, proximity (effective spacing and grouping), and rhythm or pacing between spreads to produce an aesthetically pleasing, functional design that achieves what designers call a *gestalt* or unity in a design.

All magazines have a specific niche and target audience, but the level of specificity varies. For example, while some magazines focus on sports in general, other magazines deal specifically with college football or sports photography. Other popular magazine topics include cooking, education, fashion, general interest and news, health and fitness, parenting, science, technology, travel, and much more. While magazine topics vary, the approaches to design and layout also differ between magazines, even within specific niches. For example, in the science and technology niche, the magazines *WIRED* and *Popular Science* overlap in terms of subject matter but take different approaches to typography, color, and placement of elements. However, both magazines feature large photographs or illustrations to attract attention and interest, particularly on the covers. Likewise, the home design magazine *Dwell* features photography by documentary, portrait, and fine art photographers, which gives itself a different look than other home design magazines that feature photography by architectural photographers.

Some publishers employ design agencies or consultants to design the magazine, while others use in-house staff. For in-house positions, titles for the person who produces the layouts can include page designer, publication designer, production designer, graphic designer, or designer. However, magazine design is a collaborative process that involves content from photographers (and the photography editor), writers (and the editorial department, often including copy and research),

and the digital media department (including web and social media). Regardless, the designers laying out the pages are usually overseen by a creative director or an art director who oversees the organization and aesthetic of the visual content of the magazine. At smaller publications, a person who designs the print layouts might also help with online designs such as web article layouts or social media images for the magazine, and this position can be called a *print and web designer*.

To maintain a consistent look, magazines have a style guide for the art or production department. Instead of focusing on editorial considerations (such as consistent capitalization or abbreviations of names), design style guides help the design teams maintain consistency throughout the issues. They include guidance on placement and styling of elements (e.g., photographs, illustrations, headlines, and section headers), the size and style of type for various typographic elements (e.g., headlines, body copy, and photograph captions or cutlines), and specific colors to use across the issue and within each story or section. The logo of the magazine is almost always prominently displayed on the cover near the top, although some magazines place it elsewhere on the cover. The logo consists of the title of the magazine and typically stays consistent for at least several years.

Approaches to magazine design and layout have been influenced by a variety of movements, individuals, and technological developments throughout history, particularly in the 20th century and into the 21st century. Recent technological developments such as online web publication and social media have also contributed to changes in the magazine design and layout process.

Historical Influences and Development

Magazines occupy the space between newspapers and books in frequency of publication (newspapers often publish daily, and books might have new editions after a year or number of years, but magazines publish somewhere in between, whether it is weekly, monthly, or bimonthly). The first magazines appeared in the 17th and 18th centuries, and many of the early magazines lasted only a few months. However, various magazines launched in the 1800s were still in print many years later, including *The Atlantic Monthly* (later

renamed *The Atlantic*) (1857), *Cosmopolitan* (1886), *Good Housekeeping* (1885), *National Geographic* (1888), and *Outdoor Life* (1898).

Various art movements influenced the magazine design and layout process, especially during the 20th century. Design movements from Europe helped popularize modernist approaches, which focused on function, order, white space, and consistent typography. Art directors in America further experimented with layouts, and many of them were also influenced heavily by modern art. Postmodernism later emerged, and a variety of approaches flourished by the latter part of the 20th century. Various technological advancements also contributed to changing approaches to magazine design and layout.

Influences of Art and Design Movements on Design and Layout

As magazines increased in popularity due to improved printing capabilities in the 1800s, design considerations became more important. From the 1890s to the early 1900s, Art Nouveau emerged as an international design movement. The designs inspired by this movement featured curving lines and abstract shapes. The Czech artist Alphonse Mucha and the American designer Will Bradley designed posters and magazine covers using this colorful design approach. Art Nouveau worked as a transition between the earlier ornate Victorian design movement and the various modernist art movements of the 20th century.

Years later, between World War I and World War II, European designers used new and experimental approaches. They focused on the essential, elemental forms and colors in design, and they rejected ornament. Abstract and austere art movements influenced by industrial society contributed to the modernist approaches to design and page layout, including De Stijl in the Netherlands as well as the Russian movements Suprematism and Constructivism. Magazine layouts would later feature geometric shapes composed of elementary colors, open areas of white space, and sans serif typefaces, which can be traced back to these influences. (“Sans” is French for “without”—sans serif typefaces lack serifs at the end of the strokes of letters. Examples of serif typefaces include Times New Roman and Garamond;

examples of sans serif typefaces include Helvetica, Arial, and Univers.)

The Bauhaus, a German art school founded in 1919, synthesized various art movements into a clear and cohesive modernist design philosophy. The Bauhaus emphasized form and function in design—eschewing ornate embellishments from earlier art and design movements in favor of simplicity. They also applied hierarchy of size as well as hierarchical placement of elements to emphasize the importance of some design elements. Design influences from this era also include specific layout techniques. László Moholy-Nagy, a painter and photographer from Hungary who joined the Bauhaus in 1923, developed the method of compositing overlapping elements to produce a photomontage, a design technique that would be used years later in various magazines.

Not all prominent advocates continued to support the austere principles of modernist design their entire lives. For example, the German designer Jan Tschichold originally spread the modernist design philosophies in *Die neue Typographie* (*The New Typography*) in 1928, after being influenced by the Bauhaus. Numerous printers and designers learned about contrasting type sizes, weights, and widths and the use of white space as a design practice to organize elements on the page. However, he later promoted the use of classical Roman typefaces for body copy in publications. Likewise, not all graphic designs lacked decorative or ornate elements during this era. For example, the Art Deco movement was developed in the 1920s and featured decorative elements and detailed geometric designs (it was influenced by the Bauhaus but did not focus on simplicity).

In Europe, after World War II, the Swiss Design (or International Typographic Style) movement was a result of collating and standardizing various modernist influences in graphic design (e.g., removing ornament and using sans serif typefaces). Graphic designers in Switzerland and Germany built standardized grids composed of horizontal and vertical lines to add consistency of placement and alignment in layouts; they also developed the use of consistent colors, typefaces, and trademarks, a practice that various magazines and corporations would continue to use decades later.

In the 1940s, as European designers developed International Typographic Style, American

designers such as Paul Rand applied concepts in design (such as the use of colored shapes as symbols) from modernist artists including Swiss-born painter Paul Klee, Spanish artist Pablo Picasso, Russian designer El Lissitzky, and Russian painter Wassily Kandinsky. Although he is perhaps more well-known by many for his logo design work (for brands such as IBM, ABC, UPS, and more), Rand designed various layouts for magazines, and at one point in the 1930s, he worked as the art director for *Esquire* magazine.

Mehmed Fehmy Agha, a Turkish designer and art director born in Russia, applied avant-garde or experimental design developments as a prominent art director. After working at the Paris and Berlin offices, he led art direction at *Vogue* in New York City from 1929 to 1942. He redesigned *Vogue* as well as other Condé Nast publications *Vanity Fair* and *House & Garden*. He modernized the layouts with ample white space, replacing an old-fashioned look by introducing sans serif typefaces as well as removing extraneous borders around sidebars and photographs. Influenced by Art Deco and Constructivism, Agha employed sleek lines in magazine layouts. While other magazines had featured stories that were longer than one page, Agha was the first to design double-page spreads in magazine layouts that had photographs cross the margins and spines of the spreads. He placed some photographs over the edge of the magazine pages, which were the first full-bleed photographs in magazine design. Agha also developed the pictorial feature while working with prominent photographers including Edward Steichen and Edward Weston. Although standardized grids were promoted by various modernist designers at the time, Agha often designed layouts without column rules.

The Russian émigré Alexey Brodovitch was another prominent art director of the same era; he led art direction at *Harper's Bazaar* in America from 1934 to 1958. Brodovitch applied new approaches to design and layout, employing ample white space, clean and consistent typography, and innovative photography (including work by Richard Avedon and Henri Cartier-Bresson) in groundbreaking layouts that catapulted him to celebrity status. Photographs sometimes seem pop out of the text columns, and columns of text could be curved or angled. He is known for adding a sense

of rhythm and movement to magazine layouts by varying the sizes of typography and photographs between and within spreads. Like Agha, Brodovitch understood that readers look at the magazine pages two at a time, unlike with books or newspapers, and that the designer should take this into consideration by adding unity and continuity within and across spreads.

The period after World War II featured a continued expansion and exploration of graphic design at magazines. Inspired by the innovations of Agha and Brodovitch, various designers experimented with new approaches to magazine layout. For example, Bradbury Thompson, one of the most well-known art directors of the 20th century, experimented with typography as a design element and used colorful grids in the pages of *Mademoiselle* from 1945 to 1959. Otto Storch, art director at *McCall's* from 1954 to 1967, placed text and illustrations on top of photographs instead of only beside them. At *Glamour*, Austria-born Cipe Pineles was one of the first female art directors at a prominent American magazine. In 1947, she began at *Seventeen* as art director. Pineles improved the aesthetics of the magazines she oversaw in part by hiring fine artists to produce art for the layouts.

Other developments in magazine design continued in subsequent decades. In 1968, Milton Glaser and Walter Bernard innovated with their launch of the weekly magazine *New York*. Glaser designed *New York* for an audience used to watching television; he used more subheads to organize the article content and featured advertisements throughout the magazine instead of only in the front and back. Postmodernism as a design philosophy soon developed as a reaction against modernism, starting in the late 1970s. Decorative and ornamental elements were added, in contrast to the often-minimalist look of modernist designs. Designers “broke out of the grid” even more than those who earlier broke column rules. In the 1980s and 1990s, postmodern design flourished at various magazines focused on music, culture/counterculture, travel, and sports, although many publications continued modernist or classical approaches.

One of the most well-known postmodern (and Neo-Expressionist) graphic designers David Carson is known for experimental layouts that lack a

unified grid. In 1984, Carson joined *Transworld Skateboarding* as art director. In the early to mid-1990s, David Carson worked at *Surfer* (1991–1992) and then the rock magazine *Ray Gun* (1992–1996). Carson’s work features overlapping photographs and typography, a lack of hierarchy, and sometimes even illegible text. Colorful collages of photographs, abstract shapes, and scattered type are spread across layouts that sometimes still employ color harmony (analogous or complementary)—in this way, Carson’s sometimes chaotic, expressive designs still employ some level of order.

Some could argue that postmodernism has roots in Dadaism, an experimental or avant-garde movement that began decades earlier (around World War I in Europe), because both focused on personal expression and more of a chaotic and less ordered and rational approach. However, it can also be argued that postmodernism was simply a reaction against what was perceived as the rigidity of modernistic grid layouts and its appeals to order, consistency, and functionality in magazine design. Art directors and designers can be influenced by both modernism and postmodernism, and both approaches have some aspects in common. Modernism emerged as a group of art and design philosophies in reaction to classical art and design with its ornamental decorations, serif typefaces, and lack of ample white space. Art directors influenced by modernism still produced expressive, creative layouts, while postmodern art directors still produced layouts with some sense of cohesiveness (to varying degrees).

Not all magazines of the 1980s and 1990s employed a postmodern design approach—they varied during this period, with not one dominating. For example, the fashion magazine *Elle* featured a modernist look with primary colors accompanied by photographs placed onto the bleed of the page. Another design trend in magazine layouts during the 1990s and early 2000s was the focus on celebrity portraits on magazine covers. A portrait photograph of a celebrity grabs the attention of shoppers and the increased number of sell lines (teasing the stories inside the issue) is a tactic to get consumers to purchase the issue. The 20th century ended with a wide variety of design influences, as celebrity-focused covers and content grew in popularity.

Technological Developments and the Influence on Design and Layout

Technological advancements also influenced the magazine design and layout process. Johannes Gutenberg's moveable type printing press system developed in the 15th century paved the way for periodicals later. The development of the mechanical press in the 19th century led to lower costs and the ability to reach a wider audience. During the latter part of the 19th century and the first part of the 20th century, offset printing and half-tone technology were invented and then improved. Four-color offset printing uses cyan, magenta, yellow, and black or *key* (abbreviated CMYK) and includes four separate plates. Halftoning (or screening) allows for selectively applying lower saturation levels of the inks, leading to more colors in printing. These developments would lead to faster, cheaper methods for accurately printing photographs and graphics in magazines. (Decades later, designers would need to become familiar with spot colors as well, with the development of the Pantone Matching System, which is useful for matching colors and for applying wide areas of a specific color.)

By the 1960s, metal type set by hand or machine was commonly replaced by the phototypesetting process at various magazines. It involved a keyboard and screen, and the relatively inexpensive cost and new features of phototypesetting led to an increase in the number of typefaces in magazines. The American graphic designer Herb Lubalin used phototypesetting to feature more typefaces in his designs at *Reader's Digest* and *Saturday Evening Post*. Type could be set in various sizes, and the kerning (individual space between letters) and leading (vertical space between lines of text) could be easily adjusted. Letters could be overlapped, condensed, and otherwise edited in new ways, which permitted greater flexibility in layout and design.

However, phototypesetting would later be replaced with desktop computers and desktop publishing software. In 1984, Apple released the Macintosh computer, which was the first commercially successful personal computer that used a graphic user interface (GUI), which let users move a cursor controlled by a mouse on a graphical interface (instead of a simple textual command

line prompt). Apple co-founder Steve Jobs had sat in on a calligraphy class at Portland's Reed College years earlier, which inspired the idea for different fonts in the computers at Apple, and Susan Kare, a designer of screen graphics, icons, and digital fonts at Apple, also helped innovate in this area.

With a GUI, images, shapes, and text could be overlapped and edited on the screen. As computer technology advanced and became more affordable, it allowed for more experimentation and variety in magazine layout and designs, especially with desktop publishing programs. In 1985, the software company Aldus introduced PageMaker desktop publishing software for the Mac and released it in 1987 for the PC. Quark launched QuarkXPress in 1987—it was the industry standard publication design software through most of the 1990s. However, Adobe Systems bought Aldus (and PageMaker) in 1994. Adobe outcompeted Quark with Adobe's release of InDesign in 1999, which quickly became the industry standard publication design software. As digital technology progressed, magazine designers eventually started to take over roles and tasks previously held by typesetters and production. In fact, at many magazines, the design and production departments are merged.

Digital Media Convergence in Magazine Design and Layout

Various prominent magazine companies launched websites in the mid-1990s, and by the first part of the 21st century, publishers also launched mobile apps as well as magazine layouts specifically for tablets. Effective design of digital layouts helped magazines maintain consistent branding as they faced increased competition from websites and apps. Art directors also evaluated and applied special design considerations of publishing digitally (on websites, apps, and social media). Usually, digital versions of magazines have supplemented print editions instead of replacing them. However, some magazines went fully online, such as *PC Magazine*, which went exclusively online in 2009. In 2013, *Newsweek* discontinued printing after 80 years and continued publishing digitally.

Many magazines produce online-exclusive content, and some publications such as *Forbes* have

more contributors to their digital publication than their print magazine. Digital distribution allows for magazines to publish more often—even monthly and quarterly magazines can post daily updates that are of interest to readers. Editorial content distributed digitally on tablets, apps, or websites consists of much more than articles composed of text and photographs—digital content can include video storytelling, expanded galleries of photographs, and podcasts. Infographics that accompany a story can be interactive and animated. The websites of the magazines *Women's Health* and *Men's Health* include exercise demonstration videos for readers to follow along with. Magazines focused on food and cooking such as *Southern Living* feature additional recipes and cooking videos on their websites, and video game magazines such as *Game Informer* include video game reviews in video format with footage of the games being played.

As media converged across various platforms, art directors helped maintain branding with a consistent logo and colors across different iterations of the magazine. However, some design elements such as typography for body copy can vary on websites, as compared with print. Designers follow various principles in digital publishing. For example, since the audience reads articles on an app on their phones, photographs used in digital versions of magazines need to look good at smaller sizes. Typefaces on websites need to be readable on the screen, but they also need to be legible at varying sizes due to the ability to adjust text size on websites and apps. As digital media have influenced readers, it has become increasingly more difficult to keep the audience's attention—some studies have shown that using larger photographs or more saturated colors in online images attracts more attention. Mario Garcia, who has redeveloped numerous newspapers and magazines, has advocated for shorter paragraphs even in print, so readers can digest them more easily.

Readers do not engage with information on magazine websites in such a relatively predictable way online as compared with print, where articles can be put in a specific order in the magazine. Many readers will arrive at a website through articles found via a search engine or when shared via social media. Therefore, designers strive to

establish pacing between web pages (like pacing between printed spreads) through the use of appropriate navigation links. Whereas designers needed to become familiar with production considerations as technology progressed in the latter part of the 20th century, designers benefited in the first part of the 21st century by becoming adept at digital convergence, including how video, interactive content, and user experience design can benefit online magazine design and layout through effective form, function, and a consistent aesthetic.

DESIGN AND LAYOUT, NEWSPAPER

Consideration toward the visual presentation of news on the printed page began largely in the middle of the 20th century and amplified through the end of the century with the additions of color

printing and enhanced emphasis on design pioneered by Gannett through *USA Today* and its other newspapers. In the early 21st century, design has been considered as a component of branding for a newspaper's content and as a value-added component of consuming the print edition. The layout of news pages is a distinct operation from the layout of advertisements, and it follows the long-standing separation of editorial and advertising operations; it is often called *news design* or *editorial design*.

Newspaper design and layout blend skills of journalism and graphic design. Designers often write small amounts of content, either through headlines, photograph cutlines, information graphics, or promotional references to content elsewhere in the newspaper or online. Similarly, designers use artistic skills in color, line, shape, hierarchy, scale, unity, rhythm, and balance.

As newspapers shift emphasis from print to online production, the role of design is also shifting. While designers once worked alongside local editors and reporters, now they most likely work in a different facility and design multiple titles. The once unique designs that individual newspapers had have been swapped for interchangeable chain-wide designs at major U.S. newspaper companies such as Gannett, McClatchy, and Digital First Media. This entry first discusses the history of newspaper design, then looks at its different elements. It concludes with a discussion of the increasing use by many newspapers of a centralized staff to design multiple newspapers.

History

As a field, news design came of age in the late 20th century. This focus on design came about as technology allowed for more flexibility in layout. In earlier eras, newspapers were designed with lead type and engravings to craft their messages. Photographs and illustrations were less common, and the vast majority of content was words.

Early newspapers were fairly narrow and compact but grew through the years. In the 19th century, greater differential sizes of type began to be used by newspapers for layout and hierarchy. Newspapers of this era started about 20–30 stories on the front page and continued many of them inside the paper. Broadsheets were very

wide—some were even 10 columns wide. Through time, papers got narrower and added pages. As such, design moved from being a vertical enterprise, following the columns and the height of the page, to being a horizontal one, where photographs and headlines spanned three to four columns and stories ran underneath. This movement to simplify layouts was part of a shift in focus from the depth of content to the readability of content.

The modern era of newspaper design has focused on the use of typography, differentials in type sizes, dominant art by way of photography or illustration, alternative story forms, and promotion of content elsewhere in the paper. Technology has largely shaped this evolution. Better abilities to print images in the 19th and early 20th centuries allowed for more visuals. Offset printing improved print quality, and camera-ready pasteup let designers have more flexibility in organizing content. Computer-based design maximized flexibility and made design work more detailed, with multiple elements engaged rather than text.

Design Elements

Newspapers of all types use many of the same design elements to construct their pages. *Format* refers to the size of the page and the composition of the paper. *Headlines* and *typography* refer to the styling of the text on the page. *Photography* and *illustration* are uses of artwork to help tell a story and catch a reader's interest. *Alternative story forms* are informational graphics, charts, and other types of graphical reporting that either accompany traditional reporting or stand alone as stories. *Layout* and *hierarchy* define the structure of the page. Finally, *sections* are the groupings of pages used to organize content in broadsheet newspapers.

Format

Most newspapers worldwide tend to be printed in the broadsheet format, which typically is about 10–12 inches wide and 20–22 inches tall, though exact measurements vary widely. The width of broadsheet newspapers has contracted over the years as newspaper companies adjusted paper sizes to save money. Broadsheets are typically

printed with multiple sections, which are often designated by letters (e.g., Section A for news, B for sports). The section backs of broadsheet sections are sold as premium advertising space.

Tabloid newspapers are typically the size of broadsheet pages turned on their sides and, thus, tend to measure roughly in a 10-inch square, though most are slightly taller than they are wide. Tabloids are printed in a single section and are popular for reading on mass transit in large cities. Many newspapers in the alternative press use the tabloid size for their publications, as well.

Other newspaper formats came in and out of popularity in the early 21st century. The Berliner format is a bit more compact than a broadsheet, typically about 10 inches wide and 18 inches tall; it has limited usage in the United States and is popular in Europe and parts of Asia. The 3V format, which is about 10 inches wide and 15 inches tall, also had a moment of popularity but faded from use. Both of these formats also allow for sections, like typical broadsheets.

Sections

Broadsheet newspapers are typically organized into sections. The size of sections is determined by advertising sales, printing press configuration, and editorial decision. As the size of printed newspapers declines, so have the number of sections. For example, if newspapers have a possible configuration of 24 pages, they can be organized in two sections of 12, three sections of eight, or two sections of eight and two sections of four. Each decision comes with implications of cost and content.

Sections are typically organized by content. The front section, A, typically contains what is judged to be the most important news, as well as opinion writing. The second section is typically for sports, but papers with more than two sections might organize the structure differently. Other sections include business, local/metro/state, nation/world, lifestyles, entertainment, food, home, technology, travel, and other sections of local interest. Section front pages typically follow a similar format as the main front page, with color, lead stories, dominant art, and indexing. However, section fronts might also contain a column from a reporter, columnists, or the section editor offering opinion about a current issue relevant to that section.

As newspaper page counts have decreased, the use of interior section fronts has become a way to maintain the robust scope of content for newspapers. Publications often dedicate full pages within a section to certain topics. For example, the business “front” might be a page inside the A section with a business column and two business stories.

Columns

Newspaper pages are generally built on a column grid. The grid varies based on the format of the paper; further, newspapers can choose to use any grid structure, regardless of the format. Typically, broadsheet newspapers are laid out on six-column grids and tabloids are on five-column grids. Columns generally are a little more than 2 inches wide.

Columns offer their greatest utility in advertising. Ads are typically sold in a measurement of column by height; for example, a 4 × 10 ad would be four columns wide and 10 inches tall. The relatively consistent size of broadsheet newspapers and the widespread use of the six-column grid let advertisers create ads based on a fairly standard column size and use that same ad in multiple newspapers.

The column layout also allows for the stacking of ads on a newspaper page, when multiple ads are placed on a single page. Ads might be stacked in a triangular shape, with the shortest ads on the left side and the tallest on the right. Or they might be built as a pyramid, with the shortest ads on the left side of the left page, building toward a peak in the middle, and then descending to smaller ads on the bottom right of the right page. Ads of this type tend to be used on interior pages of the newspaper; ads on section fronts tend to be the full-page width or tucked into a standing ad placement, and ads on section backs tend to be full pages. Ad placement, then, directly relates to the design of the news pages, as news content is built around the advertisements.

Layout and Hierarchy

Much like the inverted pyramid style of writing, news design follows a top-to-bottom hierarchy for importance. The most important stories go at the front of the section, and the most important

stories go at the top of the page. Section fronts are organized with the main story at the top or top right, usually, with some type of photography or illustration being shown above the fold, which is the space on a broadsheet format where the paper is folded in half. The front page is designed so that the most important information faces the reader and can be seen when viewing printed copies at the newsstand or on a newspaper rack. Secondary section fronts and interior open pages are often designed in a similar style to the front page. Interior pages with advertising often might include one or two stories, and a small photograph.

Typography

More than any other design element, typography dominates newspapers. From body copy used for stories to headlines, cutlines, infographics, and more, type is used to convey information to readers. When Johannes Gutenberg's printing press was introduced in the 15th century, early type was in the style now known as *Blackletter* and was based on the writings of scribes. Roman type, based on the engravings in buildings in the Roman Empire, became the standard for Western news during the Renaissance. Sans serif typefaces, which emerged in the 19th century, were slow to catch on at newspapers but by the early 20th century were commonplace in headlines, cutlines, and more.

The first and most prominent use of type in newspapers is the branding of the newspaper itself. The nameplate, also known as the *flag*, is the name of the newspaper itself. (The nameplate is sometimes confused with the masthead, which is the listing of editors on the opinion page.) The nameplate of many U.S. newspapers was traditionally set in an Old English style of Blackletter, often to show prominence and credibility. However, conventions of the 21st century have shifted a majority of nameplates to serif styles. A minority of nationally prominent newspapers, such as *The New York Times*, *The Washington Post*, the *Los Angeles Times*, and regionally prominent newspapers of record such as the *Courier-Journal* in Louisville, Kentucky, or *The Dallas Morning News* in Texas, have kept with the Old English nameplate style; yet, similar newspapers of stature such as *USA Today*, *The Wall Street Journal*, and *The Tennessean* in Nashville have serif or sans serif styles.

Nameplates are typically used large across the top of the front page, often stretching edge to edge, though some reserve some space for promotions to inside content, advertisements, or the weather; these corner placements are referred to as *the ear of the page*. Nameplates are also often used on the editorial page to introduce the masthead and on section fronts, though the branding is much smaller in both places.

Headlines are used as titles of articles, columns, analysis, editorials, and other story forms. Typically headlines decrease in size from top to bottom of the page; for example, the top headline might be 72 points tall, while the second is 48, and others are 36 and 30. Interior pages typically use smaller headlines than are used on section fronts. Most newspapers use a bold, sans serif typeface for the largest headline on a section front, sometimes called a *lead* or *play headline*. Subsequent headlines on section fronts and interior pages are most often a serif typeface in either bold or plain styles. Individual newspaper stylings of headlines vary widely, however. Headlines for columns and editorials, both of which present opinion writing, typically are styled differently than traditional news articles, most often using italics.

News designers have a varied and inconsistent vocabulary for a variety of secondary headlines, often known as *subheads* or *decks*. This additional type appears in a variety of places surrounding the headline to a story or within the story itself. A small headline, typically in all capital letters over a story might be called a *label*, *kicker*, or *overline*. These headlines and type treatments are generally used to pull readers into a story or to inform readers who are only scanning through the news content. Other type treatments include bylines, which are the author's name; taglines, which give an author's affiliation, email address, phone number, and/or other means of contact; jump lines, which indicate that a story continues on another page; drop caps, which are an oversized initial letter of a story that descends into multiple lines of type; and pulled quotes, where a direct quote is oversized and placed in the story. Photographs receive a caption, called a *cutline*, and a credit to the photographer. Promotional references, called *promos* and *refers*, often take the styling of headlines and connect readers to content elsewhere in the newspaper or on the newspaper website.

The body copy itself makes up the bulk of newspaper type, being the words of stories themselves. Typically, body copy is sized at 9 or 10 points tall, with 100% to 110% leading, or space between lines of type. The advent of electronic type in the computer age has allowed type sizes to be scalable to any point size, as opposed to the solid lead forms of type used in letterpress printing. Body copy tends to be set in weights of Regular, Medium, or Book styles, with italic or oblique styles used for book titles and other emphasis, per the guidelines of Associated Press style for U.S. newspapers.

Legibility and readability are the highest concerns for setting body copy, and designers consider line length (the number of characters in a line), kerning or tracking (the space between characters), and alignment (whether type is aligned on the left side, right side, or both). Most often, newspapers set news stories using justified type, which is aligned to both sides, and use type only aligned to the left side for opinion content, including columns and editorials. In addition, the primary editorial is typically set in one or two points larger than the body copy to distinguish it from all other copies in the publication.

Photography

Photojournalism as a subfield of journalism dates to the mid to late 19th century, with the first photographs regularly appearing in newspapers in the early 1900s. In 1921, the Associated Press Wirephoto service made it possible for photojournalists to transmit photos over telegraph wires and then for those photos to be used in printing. Early photojournalism was reproduced using engravings, but halftones, images composed of a series of small dots, would become the norm throughout the 20th century. By the 1980s, most newspapers had switched to offset printing, which allowed for higher quality photo reproduction than in letterpress, where images were etched into printing plates. While color photography was long used in magazines, it was not until the 1980s that newspapers regularly used color photography on their pages. *The New York Times* was one of the last newspapers to switch to color photography and reproduction on the front page, in 1997.

In design, photojournalism serves multiple purposes. First, it provides a focal point for a layout.

Newspaper designers tend to run dominant photographs across three to five columns in a typical six-column layout. These large photographs set the tone for coverage in a story and position a story as the most relevant.

Illustration

The use of illustration in newspapers was once commonplace but has taken a backseat to photography for most publications. Illustrations began to appear in the 19th century to accompany stories, with styles evolving with contemporary art movements, including art deco, surrealism, and pop art. The use of illustration was common in advertisements, though it was used in editorial, as well.

Illustration is commonly seen for centerpiece portions of section fronts or other special placements. It also accompanies alternative story forms and can be done in the range of hyper realism to overly exaggerated, depending on the artist and the storytelling intent. Illustration can be done in analog means, with a pen, pencil, pastels, markers, charcoal, or other artistic implement; alternatively, illustration can be done with digital tools, including a stylus, illustration software, intense photo editing, or a combination of analog and digital artistry.

The most common inclusion of illustration in newspapers exists on the comics and editorial pages. Comics largely are supplied through syndicate services, with popular titles including *Peanuts*, *Garfield*, and *Blondie*. Comics generally are light in tone and humorous in nature, but some, such as *Mary Worth*, *Dick Tracy*, and *Apartment 3-G*, present a serialized story and others, such as *Mallard Fillmore* and *Doonesbury*, comment on politics and sometimes run on the editorial page. Further, editorial pages often feature editorial cartoons, which are also delivered through syndicate services, though some newspapers employ in-house editorial cartoonists. These illustrations tend to be more in a line art style with exaggerated, caricature-style forms and directly discuss politics and current events.

Alternative Story Forms

Newspapers have embraced a variety of storytelling techniques beyond the traditional news

article. The umbrella term of alternative story forms includes a range of forms. Photo essays include multiple photographs and extra-long cutlines to tell a complete story. Similarly, a stand-alone photo uses a single photo with a headline and long cutline to tell a story.

Question and answer style articles remove the storytelling element and are told in the pace of the interview. Infographics present direct, brief information and can either accompany a story or stand-alone. Graphics formats include a fast facts box, which lists highlights of a story; a bio box, which has several biographical facts about a person; a checklist providing steps for doing a complex process; timelines, which show an order of events; charts, including pie, bar, and fever charts that show present data points for comparison; and maps and diagrams, which locate or explain the location of places in a space.

Design Hubs

In the early 21st century, newspapers began consolidating design operations as a cost-saving measure. These design hubs began as ways to use designers to create multiple pages for multiple titles during a shift. Eventually, designs were unified to the same typefaces and layout conventions so content could be used for multiple titles. These design hubs gave way to corporation-wide designs as used by Gannett, McClatchy, Cox, Digital First Media, and other newspaper chains.

At the design hubs, which tend to be located at one of the chain's premiere locations or near a large printing facility, design and editing functions often are centralized. Stories come in from publications throughout the chain and are laid out onto pages, which are then sent electronically to a printing facility. The hubs often coordinate with a dozen or more newsrooms and a handful of printing facilities, as the trend is to print several newspapers on the same press.

A result of this consolidation is that visual journalists have moved out of most newsrooms, and thus, concerns about visual storytelling are more difficult to relay among reporter, editor, and designer. Further, the unique style of individual publications has been erased, as chain-wide designs have been adopted for the sake of ease of content sharing. So while every publication has

high-quality design, the unique style of each publication is lost.

DEUTSCHE WELLE

Deutsche Welle (DW) is the public international broadcasting service of the Federal Republic of Germany. As such, it has played an important role in the history of European broadcast journalism. DW has headquarters in Bonn and maintains production facilities in Berlin. As an international broadcaster, it is strictly national in background and outlook but transnational in reach and is characterized by the dual function of rendering a

service to its home country as well as to audiences in its many target countries. DW produces media content in 30 different languages and, by its own account, reaches a global audience of around 197 million people per week. It is a member of the European Broadcasting Union. This entry gives an overview of DW's historic background and development as well as of its key properties as a major global news organization today.

Origins and History

DW, which translates to *German Wave*, is part of the ARD family of German public broadcasters. DW produces multimedia content (television, radio, and online) and operates English-, Arabic-, Spanish-, and German-language television channels as well as digital offerings in 30 languages. While targeting a global audience, including through its 24-hour English-language TV channel, its broadcast offerings are not available from within Germany. It has a presence in multiple target regions within which it cooperates with regional partners to tailor content to different audiences. DW came into being in 1953, when it started its first shortwave broadcast. When it began its broadcasting operation, DW was run on the basis of an informal agreement between the then-existing German public broadcasting stations (under the umbrella of ARD, a consortium of German public broadcasters). It was not until 1960 that legislation followed with the Federal Broadcasting Act (*Bundesrundfunkgesetz*), establishing DW as a public broadcasting institution in its own right and specifying its mission and organization. Based on public funding, DW was modeled after the British Broadcasting Corporation (BBC) and set up to be an autonomous operation, free from government influence. Yet, in contrast to the German public service broadcasters—notably ARD, ZDF, and Deutschlandradio—DW, as an organization representing Germany abroad, is subject to federal legislation and funded through taxes allocated by federal parliament (*Bundestag*), not through general license fees. In spite of its regulation through federal law, DW's organizational structure was modeled after that of the domestic German public service broadcasters from the start, a result of its initially being run by these very stations as well as its mission statement

being modeled after them later, in the Federal Broadcasting Act.

DW started out broadcasting in German only but soon added services in English, French, Spanish, Portuguese, Arabic, and several Eastern European languages. By the mid-1990s, broadcasting services in 30 languages had been established. Some of these now operate on a 24-7 basis, while some are limited to a couple of broadcasting hours per day. Following a period of quick international expansion, DW also became one of the largest international broadcasters, with broadcasting operations in Rwanda, Portugal, Malta, Antigua, Montserrat, and Sri Lanka.

While DW started out as a strictly shortwave radio station, in 1993, RIAS-TV was merged into DW and became its television wing. After the fall of the Berlin Wall in 1989, the television station of the United States "Radio in the American Sector" (RIAS), which had been established to broadcast Western programming from West Berlin into East Germany during the Cold War and thus had lost its original purpose at that time, was absorbed by DW. DW's television service, DW-TV, was created as a result and has expanded its foreign broadcast portfolio with television programs in English, German (both full-time), Spanish, and Arabic (both part-time). DW-TV's programming focuses on current-affairs news content as well as documentaries, features, and magazines.

DW started providing content online in 1994; *dw.com*, DW's online outlet, constitutes DW's third pillar next to DW-Radio and DW-TV. It offers public affairs and cultural information in 30 languages with a focus on German, English, Russian, Chinese, Arabic, and Spanish. The legal basis for the expansion into online content creation is enshrined in federal law, as described in what follows. After several decades of relative calm, DW developed quickly in the 1990s, mostly in response to a shifting geopolitical environment and technological and cultural change. As the German broadcasting landscape was being reshaped following German reunification in 1990, the *Bundestag* passed the *Deutsche-Welle-Gesetz* (*Deutsche Welle Act*) in 1997, which regulates the governance, organization, and sources of funding of DW until today. However, continued changes in DW's economic, cultural, and political environment saw the DW Act being amended shortly

thereafter in an effort to endow DW with a clearer mission and more explicit authority over its operations.

The amendment to the Deutsche-Welle-Gesetz was passed by the German Bundestag in October 2004 and became effective on January 1, 2005. It specified the scope of DW's operations (now covering so-called *tele media*, or online activities), a newly phrased mission statement, and detailed procedures for funding DW's operations. The amendment specifies that DW's core mission continues to provide audiences abroad with comprehensive information about Germany. The amended Deutsche-Welle-Gesetz also emphasizes a European frame of reference for DW's programming (§4). Importantly, it also expands DW's remit from the mere representation of German society, politics, and economy to serving as source of information *from* the countries in which it is received. The amended DW Act also codifies DW's role as what the German government described as "compensation and crisis radio" before the law was enacted: DW's expanded remit effectively transformed it into an alternative medium, a source of reliable information for the general population of target regions where freedom of the press and freedom of information are compromised or in crisis-ridden parts of the world where critical media infrastructure is missing. Finally, the revised mission statement for DW includes its duty to promote German and European values through its services.

Organization

DW's internal organization reflects broader similarities of the organization to Germany's domestic public service broadcasting stations: DW consists of three main bodies whose members are intended to reflect *societally relevant groups*. These groups, designated by the federal government, elect the majority of members of DW's two central supervisory bodies, the Rundfunkrat and Verwaltungsrat. Unlike for domestic public service broadcasters, some members are appointed directly by federal government, the Bundestag and the Bundesrat (the second chamber). At present, these groups include the Central Council of Jews in Germany, the Catholic and Protestant churches, the German Olympic Sports Confederation, labor unions, and

the Deutsche Akademie für Sprache und Dichtung (German Academy for Language and Poetry), for example. The Broadcasting Board (Rundfunkrat), charged with representing the interests of the general public, advising the Director-General in general programming matters and controlling compliance with DW's programming principles, consists of 17 members. The Administrative Board (*Verwaltungsrat*), charged with controlling the director-general's management beyond programming decisions, comprises seven members. Finally, the Director-General (*Intendant*) is responsible for DW's programming decisions and overall operations as well as representing DW externally. They are elected by the Broadcasting Board for 6-year terms.

A major project of DW started in early 2002, when a new German-language television Channel "German TV" was launched in the United States. This station, which was meant to unburden DW-TV from catering to German-speaking audiences, was expected to evolve into a freely distributed program receivable in most parts of the world. The station failed to attract viewers, however, and was shut down in early 2006 after the German federal parliament declined to roll forward its start-up funding for the channel. Although this was regarded as a setback for DW's management, DW announced that it would continue cooperation with domestic German public television stations ARD and ZDF.

In addition to its broadcast operations, DW has been engaged in international media development activities since 1965 through its DW Akademie. The academy since has steadily expanded its work in international media development, notably including the training of journalists and media managers from developing countries.

DW Today

As of 2018, DW has about 1,500 employees and 1,500 freelancers from 60 countries who work in its offices in Bonn and Berlin. The current director-general of DW is broadcast journalist Peter Limbourg (since 2013). After years of stagnant funding through the federal government since the 1990s, federal funding for DW has recently gone up again, along with a greater focus on the production of digital offerings and increases in global

audience reach. At the same time, DW has expanded its provision of live-streamed world news available via its website as well as video formats produced specifically for online platforms such as YouTube and various mobile devices and digital media players.

In recent years, DW has adopted a two-track strategy to service their audience in the years ahead, wherein it combines a global approach focused on disseminating information to a world-wide audience through the expansion of international television services in English, Spanish, Arabic, and German languages, with a regional approach focused on tailoring information to the needs of particular regions, primarily through the internet. At the same time, DW has shifted its targeting more toward international decision makers and democratic civil society actors in authoritarian regimes. The focus in DW's trimedial offerings further shifted from shortwave broadcasts (which continue mainly for Africa and parts of Asia) to television, online, and mobile services in the 2010s. DW News, its new 24-hour global English-language news and information channel, was established in summer 2015. Throughout such changes in strategy and outlook, a tension between DW's identity as an autonomous news organization and its political function as a federally funded public diplomacy operation has remained.

DEVELOPMENT JOURNALISM

Development journalism involves creating journalism that helps societies to improve their standard of living, particularly in postcolonial developing nations. There are substantively different theories about how journalism can support development, which correlate with different philosophies about development more generally. There is agreement that development journalism involves evaluation and translation of development policies, processes, and outcomes in terms that can be understood by ordinary people. There are radical departures, however, in perspectives about whether development journalists should support nation-building projects, act as government partners, serve as watchdogs of government, or promote empowerment of community members and social change. Each approach to development journalism has limitations, which are often compounded by the economic conditions in developing countries. The spread of the Internet and social media has deepened some of those problems but also created new opportunities for development journalists to engage with communities and support development, social cohesion, and security. This entry discusses the different approaches to development journalism, historical influences on the practice, and challenges to and limitations of development journalism. Finally, it looks at how development journalism has been affected by the move to digital media.

Multiple Approaches to Development Journalism

The goal of development journalism is to use journalism to help develop prosperous, harmonious, and safe communities. Development journalism originated in the late 1960s at the Press Foundation of Asia in the Philippines, due to concerns that journalists were reporting on government media releases and promotional events without

sufficiently analyzing or explaining development projects, policies, and issues. At its simplest level, development journalism involves investigating issues that may affect development and translating these complex matters into clear terms that are meaningful to ordinary people. Rather than focus excessively on *breaking news* about events of the day, development journalists are process-focused, looking at patterns, trends, and issues that illuminate current circumstances and the options for action. They report not just on problems but also on potential solutions. This is thought to help communities to understand and respond appropriately to the conditions, challenges, and changes around them.

There is substantive disagreement, however, about three overlapping issues. The first is whether development journalism should support government strategies and programs or engage in watchdog-style scrutiny of government. The second is how much development journalism should promote government-led policy and action compared to the empowerment of community members. The third is whether development journalism should focus on tangible elements of development such as infrastructure, economic growth, and education levels or more ideological agendas such as social change, equity, and relationships of power.

Many advocates of development journalism take a nation-building approach. This type of journalism predominantly focuses on the policies of governments, expert advisors, and institutions that lead the development of infrastructure, education systems, and resources that support industrialization and modernization. News media reports educate and motivate audiences by informing them about processes, opportunities, challenges, and impacts for themselves and their communities. A variation of the nation-building approach depicts development journalists as government partners. Supporters of this approach recognize the complexity of leading economically unstable and socially fractured societies and that governments and democracy themselves are still developing as institutions. They argue that it is more constructive for journalists to promote government frameworks and strategies and to foster a shared direction around common goals than to undermine confidence with constant critique of government or policy limitations. This approach endorses some limitations on journalistic freedom

as necessary to maintain stability and to serve the broader public good.

An opposing perspective promotes development journalists as watchdogs and guardians of government transparency. Within this framework, development is dependent on governments being open to scrutiny to ensure that they are efficient, responsible, accountable, and receptive to public concerns. In this system, journalism that exposes misconduct, limitations, and failings is an important mechanism for ensuring that governments acknowledge and rectify mistakes.

Another approach to development journalism focuses on building participation, equity, and quality of life at the citizen and community level. Such an approach is often ethnographic. Journalists embed themselves in communities to learn about people's concerns, to help them define problems and solutions on their own terms, and to campaign for change. While this form of development journalism still provides top-down information from and about governments, it prioritizes the horizontal sharing of information between citizens and communities about their needs and issues. Community media also play an important role in building capacity in storytelling, strengthening community identity and awareness, enhancing networks and social capital, preserving languages and cultures, and educating community members.

These various forms of journalism have been adopted by both developing and developed nations under various other names. Chinese journalists engage in constructive journalism that combines the government-partnership model with a solutions-oriented approach. South Korea has been a leader of citizen journalism—ranging from the OhmyNews site that involves more than 80,000 citizen journalists to numerous popular citizen news podcasts—with citizen journalists commonly inspired by a mission to improve society. Western nations have initiated advocacy journalism, civic journalism, peace journalism, and solutions journalism, which fit characteristics of different models of development journalism. It is challenging to study development journalism due to the diversity of theories and practices that the term encompasses, and the fact that many journalists who engage in practices that could be defined as development journalism do not label their work as such.

Historical Influences on Development Journalism

The multiple approaches to development journalism have been shaped by a wide range of social and political theories and movements. These include philosophies about modernization, liberation, emancipation, cultural imperialism, a New World Information and Communication Order, Asian values, and political transparency.

Following the end of World War II, Western theorists and development agencies defined development primarily in terms of modernization, industrialization, and economic growth. They posited that growth in developing countries was hindered by feudalistic tendencies, lack of entrepreneurialism, and other internal deficiencies. The mass media were seen as providers of objective, impartial information to the masses that would promote systems of rationality, logic, and behaviors deemed necessary for upward mobility and economic takeoff. These philosophies strongly influenced the nation-building and government partner approaches to development journalism, which both focus on the government and other elites' leadership of the planned transformation process. Competing theories grew from the late 1960s that development was being hampered by Western monopolization of international trade, production resources, and the mass media. Supported by the UNESCO-sponsored *Many Voices, One World* report, also known as the *MacBride report*, many called for a New World Information and Communication Order that would replace the perceived cultural imperialism of the dominant Western news media with information that flowed within, between, and out of nations in the global South. In Asia, where support for development journalism has been strong historically, many political leaders progressed these ideas of strengthening regional identities through journalism. In the 1980s–1990s, they promoted a style of journalism that they claimed would sustain essential *Asian values*, such as deference to authority, respect for elders, consensus-seeking, and social harmony. These challenges to the West's purported cultural imperialism have influenced to some degree both the government-partner development journalism model that avoids strident, Western-style adversarial watchdog journalism and the

empowerment development journalism model that seeks to distribute power, decision-making, and resources to the disadvantaged and marginalized. Alternative philosophies of collective social welfare and bottom-up governance have emerged in many communities, inspired by figures as varied as India's Mahatma Gandhi and Brazil's Paulo Freire. The liberation and emancipation approaches aim to overturn systemic inequalities by working with deprived groups to regulate the actions of powerholders and to achieve bottom-up governance, self-reliance, and collective welfare. These principles form the foundations of the empowerment model of development journalism.

Since the mid-1990s, international development organizations have promoted the notion that transparency—the timely provision of reliable information about government—is critical to development. Journalists support transparency by investigating whether governments are run in an effective, efficient, and accountable manner. These concepts form the heart of the independent, investigative, watchdog development journalism model that is promoted by the World Bank, International Monetary Fund, United Nations Development Program, and many other agencies. The ideas can also be seen in the empowerment model, as exemplified by the international news agency, Inter Press Service, which interrogates the behaviors of government as part of its charter to serve the marginalized, vulnerable, and voiceless.

Challenges to and Limitations of Development Journalism

Each model of development journalism has clear limitations. A nation-building development journalism approach may overlook issues of human development and inequality, given that increasing trade, services, and GDP do not guarantee improved quality of life. The government partnership model has often been derided as government say-so journalism. In socially fractured societies, watchdog journalists can be easily distracted by the constant critiques of different interest groups about their rivals' perceived failures, thus shifting public discourse away from attempts to consolidate leadership and agree on shared goals and plans about development. Empowerment journalists may become so engrossed in the detail of

specific community concerns that they miss big picture goals and thus may promote social change with only small-scale or short-term impacts. In unstable economies, development journalism can also be stymied by the difficulties for news organizations in earning sufficient revenue to operate optimally. Managers of financially insecure news organizations may be tempted to curry favor with government or business-funding sources, thus risking their independence and objectivity. Pressure to maximize audiences with popular *stories that sell* regularly reduces the incentive to publish nuanced stories about development without lower audience appeal. Such organizations may be unable to pay suitable remuneration to attract suitably skilled journalists or to pay for the staff hours required for extended research into intricate issues and processes that affect development and community well-being. Training is also generally a priority, given the many specialized and complex issues that development journalists must probe, but newsroom budgets and even external support from aid agencies or other sponsors may not match need. If the country has a weak rule of law and democratic systems, journalists also face legal and physical threats that inhibit robust reporting. It is also harder to research complex development issues and to craft engaging stories about such processes than to write about the more colorful conflict, crises, and chaos that form the bulk of breaking news. As a result, an ongoing challenge for development journalists operating with limited training, time, or resources is to avoid reportage that is well-meaning but unenlightening or dull.

Development Journalism in the Digital Media Age

The growth of Internet use since the mid-1990s and social media use since the early 2000s has created new opportunities and challenges. Digital media provide new channels for development journalists to engage with communities as consumers and creators of news and information that enhance personal, cultural, environmental, economic, political, and other forms of growth. By contrast, challenges faced by development journalists have deepened, as social media have disrupted the news media's income streams and

journalists' status as the preeminent definers of the *record of the day*. The spread of social media has also been accompanied by increasing spread of disinformation and misinformation, leading to new demands for development journalists to help counter the flows and impacts of untruthful or misleading information.

Opportunities Created by Digital Media

Digital media enable development journalists to provide services for, about, and with communities that were previously under-served. In most developing countries, newspapers are semielite media rather than true mass media, as they are far more accessible to affluent, educated residents of urban centers than to poorer, less educated people or residents of rural areas. Radio and television have wider reach, but ordinary people's access to development journalism through radio and television is affected by whether they can afford radio and television sets and have reliable electricity sources, the timing of broadcasts, the quality of transmission to their areas, use of local languages by broadcasters, and many other factors. The Internet and social media provide additional channels for development journalism across vast distances that can be sent at times and in a diversity of styles, formats, and languages that suit target communities. New media can also improve the development journalists' connections with sectors that have previously been underrepresented due to age, economic status, disability, gender, or other forms of social segmentation. They provide mainstream journalists with new tools to communicate with minority and marginalized communities about their issues and concerns. Citizen journalism has also flourished due to ways in which digital media have made it easier for individual community members and community/independent media to create and share journalism. An example is the Brazilian nonprofit organization *Viração*, which uses digital technologies to recruit and train teen and young adult journalists from the favelas (shantytowns) to the urban elite in the Federal District and 22 states. *Viração*'s young journalists use peer-to-peer networks to create a twice-yearly online magazine and online Youth Press Agency. The resulting journalism expresses the voice of youth on topics ranging from lifestyle to sexual

health, gender and sexuality, poverty, corruption, the environment, and human rights.

Responding to Digital Media's Negative Impacts

The financial instability of news media organizations in developing countries, as discussed earlier, has been intensified by the loss of audiences and income to the many competing sources of information and entertainment that have emerged in the digital media age. These additional threats to news media organizations' revenue have increased pressures to focus on boosting audiences, maintaining favor with funding sources, and engaging in practices that provide an easy and rapid flow of stories and other contents rather than the more resource-intensive task of liaising with community stakeholders and investigating and reporting on complex processes and issues. The increasing use of social media to circulate dis- and misinformation also creates challenges in developing countries because low levels of digital media literacy mean that false or manipulated claims are often accepted uncritically. Journalism in developing countries plays a significant role in supporting development and stability by correcting deceptive or distorted claims circulating through social media. As an example, Indonesia's CekFakta (Fact Check) online portal, which was established in 2018 and is operated by a collaboration of 22 major media organizations and five civil society organizations, publishes an average of 3.5 checks per day of contentious claims that have gone viral.

Dis- and misinformation circulated on social media regularly relate to sensitive topics of entrenched ethnic, religious, or other community differences and grievances. When unreliable information about these issues is given credence, it can provoke unrest, sometimes to the point of inciting riots, looting, and murders. Development journalists are trying to address this by taking a proactive approach in providing ongoing reports about economic, social, or other factors that underlie community disputes. The aim is that by prearming audiences with information about the context of frictions and conflicts, they are less likely to uncritically accept false or distorted claims on social media in relation to them. In the Asia

Pacific, the annual APAC Trusted Media Summits support this type of development journalism by training journalists to play a key role in preempting and protecting their societies from threats created by online information.

DIGITAL ADVERTISING

Digital advertising is the business of using computer-driven techniques and the Internet to distribute to audiences materials designed to promote products, people, or services. It takes place through sites (“publishers”) on a wide range of technologies, including mobile phone apps, outdoor boards, gaming devices, store signage, home smart speakers, car communication systems, and more. The eMarketer research firm estimated the amount of money marketers spent to promote themselves in digital spaces reached \$330 billion in 2019 and would hit \$500 billion in 2022. This entry places this profoundly influential business in historical perspective, surveys its shifting dynamics during a period of disruptive changes, and considers the social implications of digital advertising now and in its future manifestations. Finally, the entry notes the roles publics and governments are playing in trying to rein in problematic elements of this process and looks at potential changes that may be made to the industry in the future.

Digital advertising existed in nascent forms during the 1980s on platforms such as CompuServe, Prodigy, and Quantum Link (later called AOL), which Americans could access through modem-connected phones prior to the development of the World Wide Web in 1989. With the development of the web, which allowed the population at large to access the Internet, advertising became far more sophisticated and interactive. In 1994, Netscape’s web browser introduced the idea of a website, where photos, drawings, and ads could be seen immediately. (Previously, people who wanted to download pictures had to combine files in viewers such as LView.) Clicking on elements of a web page would activate hyperlinks to transport the user to other parts of the site or the web. The links represented a new way of accessing knowledge, including information from marketers.

But the real advance was the cookie. Created at Netscape in 1994, it would do more to shape digital advertising than any other invention apart from the browser itself. The cookie is a piece of text a company places in a computer’s browser. The cookie holds a code indicating that a particular computer has been to a particular site. It may also hold, or be connected to, data the company has learned about the person linked to the computer. First-party cookies are placed by the website owners (the publishers) to know what individuals do on their websites. Third-party cookies are placed in browsers by marketers, typically with the publishers’ permission and often when the marketers serve an ad to a publisher’s website.

A third-party cookie can determine whether the browser from which a person clicked on a hyperlinked ad at one site is the same browser (i.e., the same cookie ID) from which a person (possibly the same person) clicked on the company’s ad on another site. First-party cookies allow a website owner to note what web pages an individual clicked on (say, football stories on a newspaper site) and draw a profile based on that individual’s behavior (categorizing the individual as a football enthusiast), which in turn gives advertisers the ability to reach individuals in a particular category by placing ads only when these individuals are on the site. (Using tracking pixels with the cookies can indicate where on the page a person moved a mouse.) Companies using third-party cookies, for their part, could use them to create profiles of people based on their behaviors throughout the web.

The third-party capability spawned web advertising networks—companies that aggregate many websites and sell the ability to reach profiled individuals through whatever sites they viewed. The activity is called *online behavioral advertising* or *interest-based advertising*. Google from the late 1990s has used both first- and third-party cookies for this purpose. It draws huge numbers of people to its search engine, and through first-party cookies planted in their browsers can offer them to advertisers based on the kinds of topics they were searching.

Google also runs a widespread advertising network. Through sophisticated analysis of the content on its member websites, it offers marketers

the ability to serve ads based on the web page's content (an activity called *contextual advertising*) as well as based on many characteristics about individuals Google has learned by tracking their digital actions and by asking about their background. In addition to selling ads within their domains, Facebook and Amazon also run large ad networks that operate in similar ways, and there are many smaller networks.

Google makes most of its money via a pay-per-click (PPC) auction model: Advertisers bid on how much they will pay if a member of the specific audience profile they choose clicks on their ad. The percentage of people who click is very low (typically less than 1%), but the huge numbers of people using Google means that even that small percentage brings in huge amounts of money. Google also sells ads on a cost per thousand (cost per mille, or CPM) basis. Advertisers who buy ads on a CPM basis pay based on the number of times the ads show up—that is, the number of impressions they had regardless of whether the person clicked on the ad. CPM pricing is lower than PPC pricing on a per person basis because few people click but the ones who do are demonstrating interest in the product. While other ad networks follow the cost-per-click and CPM models, many individual publishers (such as digital newspapers) turn to the CPM approach because they do not reach enough people to make PPC a realistic money-maker. Even with CPM, digital newspapers struggle to profit from their digital ads.

“Programmatic marketplaces” have become the most common way for networks and individual publishers (including news outlets) to sell advertisers the right to target individuals who enter their websites or apps. The process is complex; its unfolding nature and examples of successes and failures are topics of coverage in trade publications and websites such as AdExchanger, Digiday, and Ad Age. The essential elements involve publishers who send cookie (or other tag) information about individuals to brokers called *supply-side platforms*. They help the publishers figure out the optimal price for reaching the individuals and then submit the offerings to one or more auction marketplaces. At the same time, advertisers, who are looking to purchase impressions, use demand-side platforms that help them refine their understanding of the audience they

want to reach and place bids for individuals matching those characteristics into the marketplaces. Advertisers with winning bids then can serve ads to those individuals at those sites. All this takes place in small fractions of a second.

This business framework has become the basis for increasingly complex digital advertising activities that take place on desktops, laptops, mobile phones, tablets, “smart” television sets, outdoor signs, and more. Many of these devices had applications (apps) that could not carry traditional cookies, so industry players created new types of trackers in order to follow what people were doing. At the same time, publishers and marketers developed ways to match people across cookies and app IDs in order to broaden their tracking of people. In addition, many retailers are accelerating their ability to track people's smartphone movements from their homes through out-of-home places and into the retailers' aisles. The technologies to do that include cellular, GPS, WiFi, Bluetooth Low Energy, sound impulses that interact with the phone's microphone, light systems that work with the phone's camera, and indoor mapping systems that work the phone's accelerometer. These tools are typically used to determine a device's indoor and outdoor location with the aim of sending a shopper messages about the retailer's goods, or personalized discount coupons. One way retailers can reach potential customers is to bid on reaching them when they are near their stores; the process is called *geofencing*.

Sometimes, the people targeted digitally remain anonymous, but increasingly companies turn to data providers who link cookies and other trackers to specific names, email addresses, or other personally identifiable information (PII). Firms such as Google, Facebook, Amazon, Target, and Walmart do not have to do the matching. In many cases, people log into their websites or apps, thereby identifying themselves in whatever technology they use. Those firms might not “sell” their information about individuals—one reason: the data are their crown jewels—but they often sell the right to reach people with increasingly specific behavioral, demographic, lifestyle, and psychographic characteristics based on directly accessible or purchased personal information.

The ability to track individuals across different sites as well as even different devices (e.g., laptops,

phones, tablets, and gaming machines) has led advertisers and publishers increasingly to target smaller and smaller population segments and even to personalize ad messages based on what they have learned about individuals. A challenge for Google, Facebook, Amazon, and other firms running advertising networks is to figure out whether and when the individuals' purchase journeys they track result in actual purchases. Using third-party cookies and similar trackers, they are trying to develop multi-touch attribution techniques (often using artificial intelligence) to link specific web behaviors to purchases. The biggest advertising networks even make deals with stores and credit card firms to help them figure out (often in aggregate) whether the targeted advertising they carried out resulted in purchases they could not track via cookies.

None of these activities is straightforward; tracking, profiling, and targeting are fraught with challenges for the entire digital ecosystem. Online advertisers must cope with click fraud, ad blocking, and third-party cookie/tag blocking. Click fraud takes place in PPC advertising when the owners of digital locales that post the ads are paid based on the number of visitors to those domains who click on the ads. An unscrupulous site or app owner will pay people or create automated scripts to click on ads simply to accumulate money deceptively. Ad blocking is the act of using a type of software (less commonly, computer hardware) to remove advertising content from a web page or app. Third-party cookie/tag blocking involves preventing such trackers from being installed in a person's browser or app. eMarketer estimated that in 2019, 26% of U.S. Internet users were blocking ads. While industry players debate the specific reasons for click fraud, cookie blocking, and ad blocking, they agree they cause substantial economic losses for the online advertising industry. One way some advertisers try to circumvent cookie blocking is by planting other tracking mechanisms (e.g., a type called *flash cookies*) in devices that people cannot erase by traditional means. In the United States—even under the California Consumer Privacy Act (CCPA), one of the nation's toughest general data privacy laws—trackers of all sorts are legal as long as their presence is revealed in the privacy policy. In the European Union, the General Data Protection

Regulation (GDPR) requires an affirmative opt in for all types of cookies and tags.

Efforts to Restrict Advertisers' Data Collection and Use

Many activists and policy makers see ad- and tracker-blocking as manifestations of people's discomfort with being targeted and followed virtually everywhere. Among other concerns, critics worry about marketers using and exchanging data with other marketers without people's permission. They further worry the data are used to categorize individuals and treat them in discriminatory ways (such as giving them different prices and showing them different items) based on the profiles they create. U.S. digital advertisers point to privacy policies as places users can turn to learn about the data publishers and advertisers use and share about them. They also point out that an industry program called the *Digital Advertising Alliance* instituted the AdChoices icon in 2010 to give receivers of digital advertising on Alliance member browsers and apps information to consumers when advertising data are being collected or used for targeting and to give them the opportunity to opt out of targeted ads.

Both of these activities have major flaws, however. Research has consistently shown that privacy policies are difficult to understand and often give little specific information about the firm's tracking and sharing of data. Moreover, surveys reveal consistently that more than half of the U.S. adult population believes, incorrectly, that the mere fact that a site has a privacy policy means the site will not share information without the person's permission. As for the AdChoices icon, when a person clicks on it (typically at the top right corner of a digital ad), the advertising company often tries to discourage the user from opting out by requiring a number of clicks to do it and by stating it will simply lead to the person receiving irrelevant ads.

Critics' sense of the failure of these sorts of self-regulatory activities along with heightened concerns about companies' collection of data in so many locations have led to laws that aim to give individuals more transparency and control over the data companies learn and use about them. The European Union's General Data Protection Regulation (GDPR) which went into effect in 2018 is

the most prominent law requiring firms that collect information about individuals to inform them about what the firms collect, to get the individuals' OK for every data collecting firm's use of their information, to be accountable for handling people's personal information, to allow them to know what information they have about them, and to delete the information if people ask them to do it. In the United States, the CCPA (which went into effect in 2020) has important similarities with, and some divergences from, the GDPR. Other examples of escalating action against advertisers' surreptitious use of people's data are the European Union's ePrivacy Regulation (2018) and wrangling in the U.S. Congress about a proposed national privacy law. Critics of these laws complain they place too much onus on individuals agreeing or disagreeing to collection of data. The critics argue regulation should more fundamentally constrain the kinds of information that can be collected and used.

By 2020, the regulations (especially the GDPR) and debates had thrown the digital advertising industry into a broad state of concern about its practices. Google executives announced that by 2022, the company would no longer allow firms to place third-party trackers in its Chrome browser. (Apple's Safari browser, with less traffic, was already rejecting those cookies.) Google's actions, plus European Union pressures on the European advertising industry to adhere far more strictly than it had to GDPR rules of transparency and consent, led observers to predict the demise of third-party trackers and the programmatic marketplaces that offer them. Some large publishers consequently began to plan for a future in which their own first-party cookies would be the engine of their revenues. *The New York Times* in addition touted the usefulness of contextual advertising, what it called *motivation targeting*, on its site. The idea is to serve ads based on the topic of the article and the inferred interests a person might have in reading it.

At the same time, though, a movement has grown in the United States to create new tags to follow individuals around the Internet. Some companies, such as LiveRamp and BritePool, have already developed their own identifiers for use outside Google's world. The U.S.-based Interactive Advertising Bureau has also announced it is

working on a tracker that online advertisers could use to follow web and app users everywhere. But in the trade magazine *Digiday*, Tim Peterson (2020) cautioned that "the explosion in identifiers will create complications as ad buyers and sellers must reconcile different identifiers that may serve different means or ends." The article quoted an ad executive who said that "The real work is these IDs are going to need to be based on first-party identities like email addresses or phone numbers." Inevitably, the article suggested, companies wanting to use such PII for digital ad targeting will feel the need to get individuals' active consent through an opt-in mechanism, even in states that do not yet require it.

The digital advertising arena may well be entering an "explicit permission" era, where companies in the European Union, the United States, and elsewhere will claim they received explicit permission from individuals to use their data. Will they receive consent by, in effect, bribing targets with personalized discounts? Will people relinquish their data because they do not understand the implications? Will they be resigned that providing their data has become the way of the world to which they must accede? These and related questions will have to be asked about an ad landscape that is continually changing. For example, in addition to traditionally collected data about individuals—demographic, lifestyle, psychographic, location—marketers have been showing strong interest in inferring people's emotions, sentiments, and other details from their voices. In an era where companies are starting to use such biometric interpretations to discriminate among people, the surveillance and privacy regimes that emerge around digital advertising will be key indicators of a society's ethical nature and future.

DIGITAL DESIGN

Digital design is the process of creating and implementing frictionless user experiences (UXs) on networked devices such as smartphones and personal computers. News organizations employ digital design to develop interfaces for their mobile applications, interactive graphics, and narratives as well as workflows that improve the newsgathering process. In comparison to analog design that is focused on the presentation of static information, digital design is intended to produce dynamic experiences based on data collected from a user’s interactions with a story or software application. Developing a seamless integration between content and form is essential to the design of digital experiences.

Digital design is an iterative, empirical process that draws from print design, product design, human–computer interaction, and psychology. Practitioners of digital design seek to understand an end user’s needs through research and testing in order to create emotionally enduring and culturally relevant interactions with computers. Creating meaningful digital experiences not only provides utility for end users but also provides technology and media companies a rich data trove to commoditize through advertising revenues.

Design plays an important role in normalizing the usage of networked devices and digital media to seek information, socialize, and share media. Well-designed interfaces of websites and mobile applications quickly garner the trust of users and seamlessly orient them through desired tasks such as reading a news story or sharing a photo. To achieve this, designers must develop a comprehensive UX and personalized user interface (UI) that dynamically changes with user inputs. In the context of digital journalism, news organizations are tasked with designing both compelling content and forms that provide personalized experiences for users. The focus on UX reflects a paradigm shift in journalistic practice that is distinctive to the design of digital news. This entry discusses the development and process of digital design and its relationship to journalism.

Development

In the early 1990s after the invention of the World Wide Web by Tim Berners-Lee, the design of websites was primarily text-based as web browsers did not support rich multimedia presentations. The creation of the style sheet language CSS in 1994 followed by the JavaScript code in 1995 allowed for the styling of websites and presentation of animation and video within web browsers. Another important technological advancement was the development of the web cookie in 1994 that allowed websites to track a user’s browser history.

The ability to study and target user behavior attracted advertisers and was pivotal in the emergence of the commercial web. Moreover, this created a need for artists and designers who could produce compelling banner advertisements that web users would click on. Although the concepts

of user-centered design, human-centered design, and design thinking had existed since the mid-1980s, during the mid-1990s, they found new meaning as web companies attempted to create compelling digital UXs. The need by technology companies to create UXs provided another pathway for designers to find work in the burgeoning digital economy. In the late 1990s, the Interactive Advertising Bureau and World Wide Web Consortium successfully implemented standards that were intended to optimize online advertising revenues while also making websites more user-friendly, respectively.

The creation of Web 2.0 or the read-write web in 1999 supported the development of wiki sites, forums, and content management systems such as WordPress and Blogger. The interactive web allowed for the rapid growth of user-generated content and expression. By 2005, the social networks Facebook and YouTube normalized the sharing of personal data and user-generated video, respectively. In the context of digital design, Facebook and YouTube employed simplified designs that made it easy for users to upload content and receive feedback on their postings through comments. This era also saw the emergence of print design aesthetics on the web such as grid systems, as a way to organize and curate disparate types of media and information.

Following the release of the iPhone in 2007, there was a need by technology and media companies to version their digital products across different devices and platforms. This led to the creation of responsive design in 2010, which allowed a website to be viewed on multiple devices and platforms. Additionally, in 2007 and 2009 respectively, technology companies Facebook and Apple opened up their platforms to third-party developers, which allowed for the creation of a wide range of digitally designed applications such as fitness tracking apps, mobile games, and messaging services. In short, digital design has become increasingly personalized and encourages user engagement that supports advertising revenues of media and technology companies.

Digital Design Process

It is imperative that digital designs offer a clear idea of how to use a website, a mobile application,

or an interactive graphic. Designers also work scrupulously to make UIs such as the Netflix or Hulu applications for Apple TV so intuitive that the design itself disappears. There are generally three broad roles in developing digital designs: UX design, UI design, and visual design. Design practitioners who focus on UX aim to understand the user of a digital product in order to create a holistic experience that meets their needs. A subset of UX design is the design of UIs, in which designers focus on creating an intuitive interface that clearly layouts necessary information that allows a user to navigate a device or software. *The Washington Post* home page and the HuffPost mobile application are interfaces that are intended to seamlessly lead users to news stories they are interested in. Visual or web designers employ graphic design principles to add necessary texture to an interface such as color and iconography which are necessary to understand how to navigate a website or social media platform.

There are four primary stages in the digital design process: research, prototyping, testing, and evaluation. In the research phase, a designer employs qualitative research methods such as participant observations, focus groups, and semistructured interviews to develop a strong understanding of people's needs. For example, if a designer is working for a news organization seeking to develop a new mobile application, they may study through what devices potential users access the news, the times of day they consume news, and why they are interested in the news.

By developing a strong understanding of a potential user's needs, designers can develop a broad UX layout that often begins with paper prototypes or wireframes. Designers then rapidly iterate upon the initial prototypes and may continually test each round of mockups with end users or fictional composites of potential users. Through continual iteration and testing, the low-fidelity mockups gradually become high-fidelity prototypes. This process allows for the design team to develop both a UX and an interface that will mediate between a user and the content they access through the application.

Visual design principles are crucial to the implementation of a UX and UI. Visual design asserts a product's personality and is integral to quickly garnering a user's trust. Additionally,

visual design should convey the inherent affordances of a digital interface. To achieve this, visual designers employ print and graphic design principles in the creation of digital designs. Designers employ color science, Gestalt principles, and scale to alert users to important information and to show similarity or difference between different elements within an interface. For example, a news website may use black text for its regular news headlines in contrast to blue headline text for its special investigations, as a means to draw distinction and importance.

Visual designers also employ culturally relevant iconography as metaphors for how users can use different aspects of an interface. For example, the magnifying glass icon on the National Public Radio website navigation bar signals to users that they can click the icon to search for archived stories. Similarly, the trash can icon on the right bottom corner of the Mac OSX operating system denotes to a user the location to drag and drop their unwanted files. Designers also employ other graphic design principles such as grid systems and typography to orient a user toward relevant information and to keep them engaged within an interface.

Design teams evaluate their digital products primarily through A/B testing. This quantitative research method allows design teams to test different versions of their website or mobile application on different groups of users to see which version is most effective. For example, a design team may compare the user engagement between a control group of users who continue to receive the current version of a photo streaming application versus three different groups who experience three unique new interface designs. Once a determination has been made, a firm can send out the most engaging version of their application to all of their users. The ability to track user behavior and make decisions based upon these data is an essential component of digital design.

Digital Design and Journalism

Beginning in the early 2010s, many legacy news organizations launched “digital first” and “mobile first” strategies, as people increasingly sought news and information online through their mobile phones. Digital news is designed to engage

audiences through personalized, interactive experiences and is optimized through design research of user data. Digital journalism is produced with an awareness that users will engage with stories on their own time, on multiple devices, and that a well-designed experience will encourage them to interact with stories. Additionally, news organizations create interactive products that are intended to be enjoyable for their audiences. For example, in 2015, Bloomberg published an interactive experience titled “What is Code?” that was designed to elicit user interaction in ways that explained the core concepts of software and algorithms. Similarly, in 2019, the *New York Times* published an interactive quiz titled “Are You Rich? Where Does Your Net Worth Rank in America?” that allowed users to input their income levels to determine whether they were comparatively wealthy.

In contrast to the top-down approach of 20th-century mass media, digital news recognizes the agency and proclivities of audiences as essential to the distribution of news. As compared to the design of other forms of media such as television and print news, digital news production is a collaborative process that often involves designers, developers, product managers, editors, and journalists. Additionally, diverse teams actively build customized digital experiences such as augmented reality and virtual reality stories that take advantage of the affordances inherent in smartphones and web protocols that allow for rich multimedia experiences.

The articulation of audiences as users is crucial to the design of digital news. Although designers at news organizations produce page layouts and static information graphics, these elements are carefully designed to optimize user engagement. In confluence with referencing existing design and web standards, designers at news organizations employ qualitative and quantitative data analysis to optimize user engagement with digital news platforms. Designers employ ethnographic methods such as semistructured interviews and participant observation to study how, when, and why a user engages with digital news. News organizations also employ quantitative analysis of user behavior patterns to understand what parts of their digital products necessitate improvements and how to deliver more relevant information to audiences. For example, the *New York Times’s*

Smarter Living section, which was launched in 2018, learns from user behavior to provide relevant life advice. Once a mobile news application or news website goes live, news design teams conduct A/B testing to fine-tune the UX.

News design teams may conduct A/B testing on the wording of headlines, the navigation experience, or a new page layout. In addition to conducting research to optimize a user's experience, teams at news organization also design algorithms that learn a user's story preferences and can tailor their experience with a digital news product. This is evidenced by how the *New York Times* developed a user-data-driven "For You" tab on their mobile app that populates news stories based on user preferences. Other examples of increasingly personalized news services are the News360 and National Public Radio's NPR One mobile applications.

Digital design not only shapes the construction of news platforms but also the design of stories themselves. Designers help journalists consider how a user will interact with the text, graphics, videos, and images of a story. Through this process, news design teams develop the meta-narrative of how a user will navigate a story rather than simply read or watch it. For example, when designing an augmented reality application, news design teams build contextual text in to the narrative to encourage specific behaviors of the user like turning their head during specific plot points. This is evidenced in the *New Yorker's* "Animate Objects" augmented reality experience, launched in 2019, that tells users to "turn up your audio" upon opening to convey that the experience is both visual and audible.

Many digital stories are published using existing templates within a news organization's content management system that allow journalists to publish print, video, and graphics directly to a news organization's distribution channels such as their website and mobile application. More immersive interactive stories are rapidly iterated upon from low-fidelity paper mock-ups to high-fidelity prototypes that are tested for bugs and potential weak points in navigation. Another crucial consideration for designing digital news, especially more immersive experiences such as the *New York Times's* 2012 story "Snowfall," teams must decide if they can create a story using the existing content management system such as

WordPress, or if a custom layout must be created. When creating more immersive stories, designers and developers employ open-source tools such as D3.js and RStudio as well as open-code repositories such as GitHub. These tools provide existing frameworks that news design teams can iterate upon to create graphics such as interactive maps. The open-source ethos is an important element of digital news design.

DIGITAL DISTRIBUTION

For centuries, the dominant means of delivering the news was via print newspapers, magazines, or newsletters. While radio and then television made serious inroads during the 20th century, the

biggest challenge to the dominance of print came at the turn of the 21st century with a widespread move to online distribution. This entry discusses the origins of online distribution, its evolution and growth alongside the development of new technologies, and challenges to online distribution.

Origins

Inspired partly by European experiments with delivering textual information via telephone and television, several U.S. media companies flirted with electronic delivery of information in the late 1970s. These videotex and teletext services sent text and low-definition graphics to subscribers' television sets. The systems were costly and slow and found little reception among readers, though the Minitel system in France did see some level of success.

With the introduction of personal computers into the home starting in the 1980s, commercial dial-up services such as CompuServe, America Online, and Prodigy were developed, and some publishers experimented with delivering news over those services. But those experiments, such as proprietary services undertaken by *USA Today*, *The Washington Post*, and Time Warner, failed to gain much traction in the marketplace. There were a number of obstacles, many of them economic: early PCs could cost \$3,000 or more, connection fees added another \$100 or more each month and long-distance charges, for those who did not have locally available Internet access, could add up to as much as \$1 a minute in many cases. Meanwhile, each service offered access to content from only a handful of news outlets.

Only in the mid-1990s did electronic news delivery begin to attract serious attention, with the dawn of the World Wide Web and graphical web browsers such as Netscape Navigator. In contrast with earlier attempts at delivering news electronically, this new platform offered much lower prices and a much wider range of news sources.

The World Wide Web

Initially, news offered on most websites was primarily text-based. Hypertext markup language (HTML), used to construct web pages, has always had the capability of including inline graphics as well as text. But slow (usually telephone-based)

connection speeds made web readers reluctant to wait for graphics to load. In addition, many publishers devoted little effort to preparing web content, merely reprinting news stories online in a practice that came to be known derisively as *shovelware*. Later technological breakthroughs and a change of mindset made it clear to news organizations that it was not good enough, and that a Web-first strategy was viable and competitive, with subsequent print and broadcast stories adding to and filling in the stories.

As HTML specifications evolved and Internet connection speeds increased, publishers began incorporating more graphics into their Internet news feeds. Some sites also tried offering audio and even video content, but it was not until the late 1990s that Real Networks developed a protocol that allowed audio and video content to be "streamed," with audio or video beginning to play while the rest of the content was still being sent. While that theoretically provided a solution to waiting for long periods to download an audio or video file, still modest download speeds meant that content suffered from low-fidelity audio with frequent pauses, or jerky low-resolution video. Nevertheless, some radio stations began streaming their programming and several television networks began offering limited video content, although it typically was the same as the broadcast content.

From the earliest days of using the web for news delivery, publishers sought to increase the frequency and duration of time that users spent interacting with their content. That effort was largely driven by publishers' desire to sell more advertising; the more people accessing the content and the longer they used it, the more advertising revenue could be generated. In 1996, the PointCast Network offered the first means of "pushing" content to users' computers. Coming in the form of a screensaver, PointCast sent live news; all users had to do was set up their personal preferences. Despite initial excitement, however, the software was not long-lived, as it could not be effectively delivered over home dial-up connections, and many businesses banned it for using too much Internet bandwidth.

Bandwidth was, in fact, the prime limiting factor that hindered multimedia news delivery for the first several years of the web. While some businesses and educational institutions enjoyed

connection speeds of as much as 1.5 Mbps (million bits per second), home connection speeds typically were around only 1% or 2% as fast, barely capable of delivering text at a reasonable rate. Even at their peak speeds of 56 Kbps (kilobits per second)—reached around 2000—accessing anything more than small graphics over dialup connections was still a slow process. It was not until the introduction of broadband technologies, a group that includes DSL (digital subscriber link, with a typical download speed of 768 Kbps), cable (1 to 6 Mbps), and fiber optic delivery (up to 5 Mbps) that delivering multimedia content became viable.

Broadband

Yet broadband service was slow to take off because of its high price and limited availability. Specifically, the United States historically has lagged in broadband penetration. In late 2018, for example, the U.S. broadband rate was about 14%, putting it in 16th place, long behind leader Switzerland with 47%. However, access to high-speed connections became much more common with the widespread adoption of smartphones starting in 2007. By one estimate, 96% of the global population had basic mobile cellular network coverage by 2018, and access to higher speed networks was increasing rapidly.

Widespread adoption of broadband access made it possible for content providers to deliver audio, video, and other multimedia material without asking users to endure long waits. It also helped blur the lines between traditional news media, speeding convergence. For example, *The Washington Post's* online division won the first Emmy award ever given for “outstanding achievement in content for non-traditional delivery platforms.” (Along with *The New York Times's* website, the *Post's* service managed to grab five of the seven nominations for the video award). Widespread broadband access also led CNN to offer its Pipeline video news service, offering both live and on-demand video.

Speeding delivery even further was the widespread adoption of Adobe's Flash technology in 2002 to compress multimedia files, allowing users to enjoy high-quality video and photo slide shows. In 2007, *The Washington Post* marked an important milestone with its onBeing video series, which

offered full-screen high-definition video. However, that same year marked the beginning of the end of Flash, as Apple introduced its first iPhone, which did not support the technology and forced publishers to find other solutions.

Alternative Formats

News sites also began experimenting with other means of delivering content online. Web logs—or blogs—gained notice as a tool for mainstream news delivery in 2002, but their use for news dates back to at least 1998. Video blogs (also called *vlogs*) attracted attention around 2005, and some (such as the one created by technology writer David Pogue, then of *The New York Times* and CNBC) proved extremely popular.

The launch of YouTube that same year markedly changed the game and increased the use of online video. Most major news publishers have created YouTube channels, each attracting millions of subscribers. And as creating and uploading videos became increasingly simplified and YouTube began offering payments to popular contributors, many upstarts joined the traditional media outlets in creating an immense variety of YouTube news channels.

In 2006, a 3-year-old platform named Facebook opened its service to anyone age 13 or older with a valid email address. What started as an online student directory would eventually metastasize into a meeting place for nearly 2.5 billion monthly active users—sure to draw the attention of news operations. Facebook welcomed articles from news sites, seeing a major source of free content. In return, news companies got the promise of widening their reach and attracting users to their sites. But instead, many users read the articles on Facebook and in some cases abandoned the news sites.

Over the years, Facebook launched several initiatives such as Instant Articles to help publishers derive income from journalism distributed via its platform. But such efforts were short-lived and, in the case of Facebook's pivot to video in the mid-2010s, even harmful as newsrooms diverted resources to a new technology that would not pay off. In late 2019, Facebook made another attempt to court publishers in announcing a News Tab feature that could eventually have 20 to 30

million users. The feature faced mixed reception, perhaps because of earlier unsuccessful offerings.

The same year that Facebook opened to the public, a platform known as *Twitter* made its debut. Designed to be used with mobile phones, Twitter allowed users to send brief messages of up to 140 characters. Interested parties could subscribe to individuals' Twitter feeds (known as *following a feed*). While at first largely used to convey the mundane details of personal life, Twitter soon came to be seen an effective tool for communicating during breaking news events. News organizations took notice, and Twitter soon became the go-to tool for journalists looking to report in real time, whether covering politics, sports, or court proceedings. Some news organizations also began using Twitter to deliver breaking headlines and links to stories. By the end of the decade, a study of Twitter discussions about immigration found that content from news outlets were the most-shared articles among Twitter users.

Other emerging social media platforms would also capture the attention of news organizations. Wanting to be where the audience's eyes were—and particularly the eyes of potential young audience members—journalists looked for ways to use image platforms Instagram and Snapchat, as well as the short-video platform TikTok.

Another new delivery option was the podcast, which offered users audio or video programming that could be downloaded to a portable music player or played on a personal computer. With roots going as far back as the 1980s, podcasts started to take off in the early 2000s as portable music players such as the iPod became popular. While initially embraced by the news media as an exciting tool for delivering content in a new way, enthusiasm waned fairly quickly and podcasts became used primarily as a mechanism for time-shifting radio and television content, designed to be accessed by users on the go. However, the success of the *Serial* podcast, which first aired in 2014, caught publishers' attention and reinvigorated the podcast movement. The first two seasons of *Serial*, a spinoff of the public radio program and podcast *This American Life*, were downloaded more than 250 million times, showing there was an audience eager for nonfiction audio storytelling.

As audiences moved away from desktop and laptop computers and began consuming much of

their news on smartphones and other mobile devices, many news organizations began offering news in formats appropriate for use on the new devices. At their simplest, these efforts involved text and email alerts. In addition, many news organizations offered access to top stories via special mobile websites or branded smartphone apps. Eventually, updates to HTML and CSS (cascading style sheet) specifications allowed publishers to build responsive sites that adapted to whatever screen size and type they were being viewed upon. But some apps still remained popular, such as the news aggregator Apple News, launched in 2015 for users of devices running Apple operating systems. In 2019, Apple News+ followed offering a subscription-based service featuring content from more than 300 magazines as well as newspapers including the *Los Angeles Times*, *The Wall Street Journal*, and *The Star*, Canada's largest daily paper.

Another emerging platform was the email newsletter, which became increasingly popular in the 2010s with some large news organizations offering dozens of daily niche newsletters. Newsletters offer several advantages. They are quick and easy to assemble from already created content, offer a way to catch readers' attention every day, and help drive traffic to news organizations' websites. The latter point gained in importance as more newspapers put all or most of their content behind digital paywalls, hoping to convert non-regular readers into subscribers.

A perhaps unexpected platform emerged toward the end of the 2010s, with streaming services such as Netflix and Amazon Prime Video adding news programs to their offerings. Given that both services rely on content that could stay fresh for a reasonable amount of time, offerings on both services tend more toward features than breaking news. Netflix began its move into news by producing a string of current affairs talk shows, signing up comedians to present programs that were significantly devoted to satirizing the news. In addition, in 2018, the company struck a deal with former President Barack Obama to produce a series of documentaries and historical films.

Challenges

Perhaps the greatest challenges and opportunities came in response to shifts in how people not

involved in the news media used electronic media to communicate. As more individuals, businesses, and organizations used digital and mobile technologies to produce and distribute news of importance to their own communities, news media looked for opportunities to become part of the phenomenon. Their actions trended in two directions: first, attempts to bring the audience into the process of distribution by encouraging audience members to comment on news stories and to submit their own photos and video, commonly referred to as user-generated content; and second, efforts to establish a presence in social networking communities such as Facebook (as well as in the early online virtual world Second Life), with the goal of drawing attention to their own content.

While the rise of online distribution was rapid, it was not without problems. The most persistent was lack of revenue. After initially putting content online for free, news providers found it nearly impossible to charge users. And with much of traditional media advertising migrating to nonmedia sites such as eBay and Craigslist, news organizations found it hard to generate the kind of revenue they were used to. The declining fortunes of traditional media—particularly daily newspapers—made many resort to cutbacks and layoffs to close some of the gap. The constant search for revenue also pushed some news sites toward emphasizing infotainment content to attract the most page views, a move critics said trivialized news content.

Online distribution continued to lag in at least two other areas as the second decade of the 21st century drew to a close. The first was making online products interactive. While news media had come a long way, for the most part they had made little headway in moving the news into an engaging experience. Aside from offering an occasional role-playing game or letting users upload photos or search databases, most news media offered little in the way of interactivity.

Similarly, after more than two decades of offering their content online, few news organizations took advantage of the Internet's ability to let users customize their sites, despite multiple attempts over the years. Still, despite those shortcomings it was apparent that online delivery quickly had become a dominant mode of getting news to users.

Users expect to have immediate access to the important news of the day virtually any time and anywhere.

DIGITAL JOURNALISM ETHICS

Journalism ethics is the responsible use of the freedom to publish. It is the study and application of ethical norms that should guide the social practice of journalism, in its many technological, cultural, and organizational forms. The norms are constructed with a practical purpose in mind: to help journalists respond thoughtfully and consistently to new or recurring problems in daily practice. These norms take many forms, from an individual journalist's set of values to a code of ethics for a professional newsroom. This entry discusses the origins of digital journalism ethics and ethical challenges that digital journalism poses. The entry closes with a brief overview of responses to these challenges.

Journalists have duties to perform and norms to honor because, as human beings, they fall under general ethical principles such as to tell the truth and minimize harm and because, as professionals, they have social power to influence public opinion. With power comes responsibility. However, what the term *responsible* means can vary from country to country, reflecting differences in culture, technology, and political structure.

Since the early 1900s, journalism ethics has belonged to the field of professional applied ethics, alongside ethics in law, medicine, and business. Since the turn of the 21st century, digital media have expanded journalism ethics beyond professional newsrooms.

Journalism ethics is an element of educational programs and is an academic discipline. It is taught and critiqued in journalism and communication schools, while theories of journalism and its ethics are developed by social scientists, philosophers, and ethicists. A large number of academic books and journals are devoted to ethical issues in journalism, media, and communication. In addition, there are journalism centers, societies,

and media monitoring groups devoted to advancing ethical media and to evaluating news coverage for accuracy and bias.

Digital journalism ethics is an increasingly important part of journalism ethics. It is the study and application of the norms of journalism in its use of digital means of communication, such as the Internet and online platforms from websites to social media. Digital journalism ethics includes the norms for using digital-based tools, from virtual reality cameras for telling stories to video-equipped drones for gathering news. Much of current journalism ethics revolves around new or controversial practices by digital journalists—practices that challenge traditional norms. More broadly, digital journalism ethics features debate about the role of journalists in a world dominated by digital, global, media. Journalists struggle to define their roles relative to a global public sphere increasingly polluted by disinformation and manipulative, intolerant voices.

Amid a media revolution, the field of journalism ethics today is active—a zone of controversy and fragmentation, where different kinds of journalists adopt different approaches to journalism. Traditional forms of journalism, such as objective news reporting, remain. But it is joined by online opinion journalism, fiercely partisan journalism, civic-minded engaged journalism, and social media journalism. A prior professional consensus on ethical principles has been weakened, prompting the articulation of new principles. These tensions within journalism ethics signal the decline of a tidy, pre-digital journalism ethics for professionals, established a century ago, and the birth of an untidy digital journalism ethics for almost everyone.

Origins

Digital journalism ethics is the latest development of journalism ethics, centuries after the creation of a non-digital news press. Western journalism is more than 600 years old. It began with printed newsbooks and one-page broadsides in major cities, such as London and Amsterdam, in late 16th century Europe, using Gutenberg's printing press. From the start, authorities questioned the ethics of this fledgling press: Was it reliable? Did it favor emerging social classes or did it support the status quo? Monarchs challenged its freedom to publish.

Journalism ethics would take two forms before digital journalism ethics would appear: First, journalism ethics would consist in broad philosophical views about the press's role in society. Across the 18th and 19th centuries, press philosophies would discuss the limits of press freedom, the press's role in enlightening the public, and the press's relationship with government authority. One such view has already been mentioned: the authoritarian view embraced by powerful monarchs, that publication is a privilege, not a right. The authoritarian view, at its height in the 17th century, would slowly fade as Western countries such as England, France, and the United States evolved into more liberal societies, as described by Stephen J. A. Ward in *The Invention of Journalism Ethics*. However, the authoritarian view continues to exist today in such countries as China, North Korea, and Iran.

In the 18th century, editors and political writers constructed a "public" ethic of journalism as the number, kinds, and power of newspapers grew enormously. Newspapers claimed to represent the public in the Enlightenment public sphere, acting not only as informer but also as a watchdog on government. In the 19th century, the public ethics evolved into the liberal (or libertarian) theory of the press, which stressed the need for a maximally free press to advance liberal reforms. The classic liberal argument was written by John Stuart Mill (1806–1873) in *On Liberty* of 1865. Mill's ideas reflected writings on the press by a long list of liberal-minded thinkers, from David Hume (1711–1776) and Condorcet (1743–1794) to journalists such as Walter Bagehot (1826–1877) and Thomas Paine (1737–1809).

As the 19th century came to a close, journalism ethics would take a second form: journalism ethics would become a practical, working guide for the growing number of journalists and news organizations. Journalists in the United States, Canada, Western Europe, and beyond formed regional and national professional societies and created codes of ethics dedicated to serving the public. The codes contained principles, rules, and preferred ways of reporting on typical subjects. A dominant form of code, from the 1920s onward, expressed the need for reporters to cover events with a neutral attitude and to report "just the facts." This was the ideal of professional objective journalism.

It called for the elimination of a reporter's viewpoint from their story, as newspapers and then broadcasters separated news and opinion journalism. The model was in its heyday between the 1920s and 1960s, although the ideal was more popular in North America than in Europe. Despite a growing criticism of the professional objective model across the 1900s, the model did not perish and its norms still influence practice and discussions of journalism ethics.

At the turn of the 21st century, after a century of professional journalism ethics for non-digital media, a digital era in communications began to take root and change society. It would fundamentally transform journalism and its ethics.

Ethical Challenges

The challenges posed by digital journalism can be broken down into a number of categories. One category consists of questions about the future of journalism ethics when almost anyone can publish journalistic articles online. In the early years of the 21st century, many mainstream journalists resented the new online writers and refused to call them journalists. Many of the initial bloggers and online writers stated that they did not fall under established professional codes of ethic. They worked to their own, and different, standards. Others said that neutrality and independence are myths and it is better to be transparent: to state publicly one's biases and the groups that one supports. As a result, hardly a principle of professional journalism ethics has gone unchallenged.

Perhaps the largest category of tough questions concerns the proper relationship between speed of publication and the verification of facts. Should ethical journalists try to keep up with the breathless pace of rumors online, setting aside existing norms for prepublication verification? How or when should ethical journalists repeat information on social media, for example, a rumor that there is a shooter in a school? How can editors of mainstream news outlets, such as CNN or the BBC, confirm the authenticity of images on events provided by citizens from their smartphones?

Another category of questions deals with what ethical principles apply to emerging forms of digital journalism such as the civically engaged online journalist. If journalists create a news site funded

by citizens and philanthropic groups, what ethical rules protect such sites from the undue influence of its funders? What ethical ground rules govern what citizens say on sites devoted to the discussion of sensitive issues such as racism or human rights?

Another category deals with specific technological developments, that is, new digital tools for newsgathering. How should journalists use the powerful images of virtual reality to tell stories accurately without embellishing the story for visual affect? How should newsrooms use drones to cover a hostage taking or a police highway chase?

More recently, digital journalism ethics has struggled to deal with the use of online media by governments and intolerant groups to spread misinformation, “fake news,” and hate speech. What new norms are needed to guide news coverage of racist public figures or public meetings of intolerant groups? Quite suddenly, journalism ethics comes to include society-wide collaborative efforts by journalists, civic society, and government to identify fake news and the agents of disinformation.

Finally, journalism ethics confronts the fact that codes of journalism ethics need to be altered or extended to evaluate stories on global issues, such as immigration and climate change, or stories that may prompt a violent response in other cultures. Digitalization has created a media that is global in reach and impact. Historically, the codes have been parochial or non-global: they have been regarded, typically, as applying to journalists in a city, a region, or a nation. Not enough is said about how to evaluate reports that will circle the globe. Journalism ethics, it seems, needs to “go global.”

To summarize, here is a list of issues that dominate journalism ethics today:

- Questions of identity: If citizens and nonprofessional journalists report and analyze events around the world, who is a journalist?
- Questions about scope: If everyone is potentially a publisher, does journalism ethics apply to everyone?
- Questions about content: What are the most appropriate principles for digital journalism ethics? For example, is news objectivity still a valid ideal?
- Questions about new journalism: How can new forms of journalism, for example, nonprofit journalism or entrepreneurial journalism, maintain editorial independence?
- Questions about community engagement: What ethical norms should guide the use of citizen content and partnerships with external groups?
- Questions about global impact: Should journalists see themselves as global communicators? How do journalists reconcile their patriotism and their cosmopolitanism?
- Questions about the amplification of intolerant voices and fake news: How should journalists cover intolerant groups and fake news?

Responding to the Challenges

The stress so far on the problems of digital journalism ethics may sound like a counsel of despair—that there is no hope of resolving these thorny issues. This is not correct. In the past decade, there have been encouraging developments in terms of the invention of new principles, new best practices, new guidelines, plus reformulations of ideals. The shock of the media revolution which threatened to swamp journalism ethics has worn off. Journalists and ethicists are finding creative answers to what once appeared to be insolvable problems.

Large digital handbooks have appeared, tackling many of the issues just noted, such as *The Sage Handbook of Digital Journalism* (2016) edited by Tamara Witschge and others and *The Routledge Companion to Digital Journalism Studies* (2017) edited by Bob Franklin and Scott Eldridge II. As well, ethicists have created guidelines for the use of social media, virtual reality, drones, artificial intelligence, and big data computer methods, as can be found in books such as *Ethics for Digital Journalists: Emerging Best Practices* (2015) edited by Lawrie Zion and David Craig. Journalists and ethicists are making progress on what seemed to be an insoluble problem: verification online. New work explains how to improve verification after posting by using the knowledge of the “crowd” online. Researchers such as Crag Silverman, in his *Verification Handbook* (2014), develop methods for quickly verifying online images and other materials in real time. Meanwhile, major news organizations from the

BBC to *The New York Times* have revised their codes of ethics to guide journalists on such problems as how personal they can be on their own web sites. The Canadian Association of Journalists has developed guidelines for picking up stories from social media.

Fake news has spurred the creation of dozens of fact-checking websites that check politicians' statements during elections. For example, at Harvard University, the Shorenstein Center on Media, Politics, and Public Policy operates First Draft, a coalition against fake news. Civic society web sites, many of them in Europe, monitor religious hate speech online. Scholars and journalists have begun to construct a global media ethics, such as Stephen Ward's *Global Journalism Ethics* (2013) and the articles found in *The Handbook of Global Communication and Media Ethics* (2011) edited by Robert Fortner and Mark Fackler. New global media principles, often adapted from theories of human rights and human flourishing, redefine journalism as a globally responsible practice.

These scholarly and journalistic reinventions of the ever-evolving art of journalism show that journalism ethics can, and must, adapt to a new media world. Both journalists and members of the public can become ethically responsible digital citizens. The key question is not, "How do people protect a journalism ethics inherited from another media era?" The key questions are, "What new journalism ethics can people construct?" and "What should be the ethics of a digital, global media used by professionals and citizens?"

DIGITAL JOURNALISM TOOLS

Digital journalism strives for transparency while still including traditional journalism values. Digital tools can offer transparent storytelling by including more voices, sources, and documents in news content. These stories can increase audience engagement with real-time metrics and strategized social media posts while still holding up normative journalism values such as the need for experts, fact-checking, and timeliness. Converged newsrooms can use a combination of digital text, video, audio, and/or other multimedia products to deliver information in a timely manner to an audience. This can take the form of a Wordpress website/blog, podcast, and/or vlog/short form documentary via YouTube or other Internet products. Social media is still an emerging format that digital journalists can use to deliver information in a nontraditional format that focuses on smaller screens with shorter content, but can be just as effective in news delivery be it over Twitter, Instagram, or TikTok, among others. As the evolution of digital media and its tool use continue to change, fluctuate, regulate, deregulate, and expand, journalists face a daily disruptor in news delivery. This entry offers a brief overview of the history of digital journalism and discusses the digital content creation process, including ways in which researchers and journalists brainstorm, conduct research, add multimedia components to writing, edit, and publish work.

Digital Journalism History

When the Internet officially opened to the U.S. public in 1991 and became widespread in the

mid- to late-1990s, more media outlets started going online and experimenting with digital content delivery and using a variety of tools. However, even though online news distribution was not common in the early 1980s, many news outlets were ahead of their time with a failed digital news delivery experiment. According to The Poynter Institute for Media Studies, a journalism research organization, the CompuServe news distribution experiment helped create the first digitally accessible U.S. newspaper with a dial-up service. The Columbus Dispatch was the first to make the digital jump, with other large Associated Press (AP) papers joining shortly after. At that time, dial-up was very slow with a daily newspaper taking hours to download. This form of electronic journalism needed the distributor and the receiver of the information to have a dial-up service, a landline telephone, the latest IBM computer, and specialized software. The agreement between CompuServe and these AP papers ended in 1982. The agreement and service demise were mostly attributed to the cumbersome and expensive systems needed to access digital text in a timely manner to a mass audience.

Digital Journalism in 2021

Throughout the digital content creation process, journalists use a variety of digital tools to help them make content fit for a range of audiences. To create engaging multimedia content, they must first start with an idea. This can be seen as the first step in digital curation, the brainstorming step. Once a topic is chosen, a number of online nonprofit and government organizations can assist in the research process. At times, there might be a vast amount of data collected during this data gathering stage, and the Internet provides a multitude of arenas to analyze and find this data. Then comes the task of making this research engaging to the audience through images, video, and audio pieces. Many sites can assist with content editing and formatting, making it accessible to a wide digital audience. Finally, the publishing process allows the journalist to find just the right medium to host and distribute the content, with social media increasingly becoming an avenue of publishing and/or promotion of this material.

Brainstorming

Brainstorming allows the researcher to look at documents and data for story inspiration or to further examine a topic of interest. For instance, at the federal level, looking into publicly available government data, such as an online vault of FISA orders, can be found at the Electronic Privacy Information Center. This site provides statistics organized by year on surveillance orders given by the U.S. government. A resource for finance information is USA Spending database, which enables citizens, researchers, and the media the ability to visualize yearly tax data and track how taxpayer funds are used. Data.gov provides easy-to-access PDFs and raw data on credit card information, government Small Business Administration loans, among others, for the public to download and use. The Center for Public Integrity, a nonprofit, investigates government corruption and distributes information to various media outlets about current investigations.

Local websites through the city, county, and state can also provide fast and sometimes free data on population, health, and economic statistics that could lead to a story as well. Nonprofits can also provide local data on marginalized communities and social issues that mainstream media may overlook. One way to keep in touch with these local state and nonprofit institutions is by signing up for their media email lists that can alert news organizations to social issues such as changing local housing ordinances or natural disaster alerts in the area.

Universities and news organizations also have brainstorming tools. A *.edu* or *.gov* at the end of a web address helps researchers verify the site. The University of Georgetown's Free Speech Project has an interactive political news map that lists recent free speech cases across many institutions and divides these into different categories such as Hate Speech or National Security. The Washington Post has resources for junior digital journalists in its various video series *How to be a Journalist* and teaches journalists how to research topics in *Fact Checker*.

Research

The next phase of digital writing is utilizing online research tools. Federal resources include The

Library of Congress, which can offer a vast number of digitized documents, rare audio recordings, scanned books, and news archives. Most government-funded museums have digital archives that have easy to use websites such as The National Archives Museum for historical U.S. documents and the National Archives Online Exhibits for veterans' service records. Each of these archives has its own set of copyright and publishing guidelines that one should read and understand before extracting and publishing.

At the state level, the State Digital Resources page lists online accessible digital archives for all 50 states. Investigations needing historical local economics and grant funding can use ProPublica's stimulus data registry per U.S. county. The Census Reporter visualizes local and state data into easy-to-understand graphics for readers. The Sunlight Foundation, which advocates for government transparency, is a nonprofit that provides a variety of training tools for those in need of accessing and analyzing data quickly through online sources and its video series.

Journalism nonprofits can assist in the research phase if journalists need federal government documents for investigative pieces. The International Consortium of Investigative Journalists provides a database of offshore organization information as well as a medical device database. ProPublica offers a quick search database of nonprofit Form 990 tax reports. The Freedom of Information Act (FOIA) allows journalists to request government documents. Assistance with FOIA requests can be found through FOIA Wiki as well as the National Security Archive. The National Security Archive, hosted at George Washington University, also has a database of previous FOIA requests, declassified information, and the document archive is free and open to use. The FOIA Project lists which FOIA requests are in dispute in U.S. courts. The Student Press Law Center hosts a FOIA public records letter generator that creates a quick government document request.

Easy-to-search Amazon Web Services houses a collection of public data sets provided by organizations such as Facebook, National Aeronautics and Space Administration, the National Oceanic and Atmospheric Administration, and the Internal Revenue Service. Global open access data are also

provided by The World Bank Open showcasing graphs and data collections on international development information such as income, poverty, and pandemic data. Google Public Data is another depository of information from organizations such as the U.S. Bureau of Labor Statistics and the U.S. Census Bureau.

Fact-checking data tools are available online through the Google News Initiative, which provides various training tools and Google products such as Google Fact Check where one can verify people, places, and topics. One can access charity verification through the Federal Trade Commission page *Before Giving to a Charity* as well as Charity Navigator, GuideStar, and Charity Watch. To verify the location of an image, image metadata extractors can be a fast way to pull geological coordinates from images to find their origin. That can also be done manually looking at the metadata of the individual image and entering the coordinates directly into a Google Maps search bar.

Multimedia

Images, video, and audio content added in digital pieces need to be curated and checked for copyright. Copyright permission is critical for published content, especially if that content is not being used in a classroom. Copyright owners have sole discretion on how their content is shared, purchased, and/or transformed. Some content can be required to have attribution (recognition of author) even if the content license has no required fee. Since copyright is a strict liability tort, it is the sole responsibility of the publisher to make sure that copyright permission or ownership is properly procured.

Images

Image use in digital journalism projects is common and useful for multimedia pieces to help readers connect to the stories and click-through thumbnails. Several online federal resources such as the National Gallery of Art can be a source for historical images and are useful in some research and embedded slideshows. However, copyright permission is not a given for any image in the archives, and individuals must do their due

diligence before publication. Another federal resource is the National Aeronautics and Space Administration, which has some archival and updated content of space images, weather science data, graphics, Earth photos, maps, and climate change information available in the public domain (requiring no permission to use). However, its logo is federally regulated. Google's image search allows journalists to reverse search an image if looking for image copyright or information.

In terms of image design, Canva has free and paid stock images and vector graphics available to create photos in multiple formats. For image editing, Pixlr provides free online photo editing software. Adobe Spark offers free and sign-in required photo editing services online. Gifs are able to provide some multimedia content to more entertainment-based journalism projects and can be created with a free online account at Giphy. For juxtaposed images, the Knight Lab has a free upload-and-download JuxtaposeJS service. Flickr Public Domain, Wikimedia Commons, and Unsplash provide easy-to-search public domain images to use in any capacity. And Creative Commons image search offers access to multitudes of nonprofits, museums, and organizations that give options to license out images for nonprofit, educational, and/or commercial use for free or for a fee, or just requiring attribution.

Videos

Creating video projects for multimedia journalism projects can be completed quickly with the help of YouTube to upload and host video content. Free editing software is available at Google's YouTube Creator Academy. Its user agreement for audio and editing is clear cut and content can be quickly embedded with a copy and paste of its editable HTML code for blogs or websites. Shorter links from uploaded videos can be created for fast social media shares.

For shorter form content, as of 2021, TikTok and Snapchat are popular platforms for videos ranging from 30 seconds to 1 minute of run time. Effects and editing software within these mobile apps are free to use. Traditional news organizations are just starting to understand how to utilize these. Campus news organizations are already seeing success in engaging their younger audiences

using short form and social media video news content. However, just as Vine disappeared while still very popular, these can too. If so, a short form social video provider will most likely pop-up in another app.

Popular brands offer some low-cost or free video editing services. Apple has iMovie and Final Cut Pro for laptop and desktop video editing. Clips can work for a quick editing of multiple clips on Apple's iPhone and mobile-based products. Adobe Spark is a free online-based video editor, and Vimeo Basic has ad-free video hosting services.

One can find public domain clips for longer video projects at government websites such as the Grand Canyon National Park Service for aerial shots on the Colorado River or other American vistas. Vimeo has a public domain channel with videos such as subway b-roll or pigeons in a park. The Internet Archive hosts many vintage U.S. government public service announcements and news reels, as well as public library archives. It is important to do an independent investigation on the public domain status of all material downloaded.

Audio

Audio editing is available from many popular brands, such as Adobe Audition, one of the top products for audio recording, manipulation, and editing. Audacity is an example of free, commonly used software for multitrack audio editing.

Sound effects and music can be integral to telling a good story over video or podcast. YouTube has a vast amount of free-to-use music and sound effects in its Audio Library. Soundcloud has a Creative Commons tag option that can allow for commercial use of music tracks. Through an advanced search, these types of files can be a good source for background music in documentary projects. For hosting audio files, Soundcloud has some free and paid options. Podbean and Buzzsprout are for podcasting.

Without a studio, recording a quality phone call in .wav or .mp3 file can be difficult. However, there are mobile apps that can assist with creating usable audio files to embed in a webpage or audio piece. A quick app store search brings up a list of easy-to-use tools for recording phone audio. One should check state law before recording phone conversations.

Editing and Publishing

Once the digital journalist is ready to publish, choosing the right platform can be a task in itself. It is important to consider the audience, searchability, and appeal of the content being published. Blogs, social media platforms, or traditional websites are often the method of delivery. Web design tools can range from the more complex HTML and CSS coding to more user-friendly site builders such as Adobe Dreamweaver CC, Wix, and Wordpress.

Search Engine Optimization is considered a best practice for publishing content online. Answer the Public can help publishers understand online trends. Google Trends is another Search Engine Optimization data resource used to see what segmented audiences are searching for online.

Google News Initiative was created specifically for journalists in digital media. Journalists can publish source documents to the Google Doc cloud and link or embed them in online articles to allow for greater story transparency. Other Google products such as Google Alerts can help with staying up-to-date on specific topics, places, or events. Google Scholar is an easy-to-use search tool for scholarly articles and citations. Embedding polls in digital stories is easy to do with Google Surveys. In partnership with ProPublica, the Google News Initiative has the Election Databot that organizes political stories by location and topic and provides graphics and topic maps. Overall, the Google News Initiative is a useful source for the latest digital hacks and tool use inspiration.

Social media analytics and publishing tools can come in handy when working on multiple accounts, keeping up with a communication calendar, and promoting stories on a daily basis. Depending on need, most social media digital managers look at scheduling and analytics websites such as Hootsuite, Sprout Social, Sales Force, Tweet Deck, or Sendible. Most social media platforms, such as Facebook and Twitter, also have their own scheduling and analytic interface.

Digital Life

These digital journalism tools as well as website addresses are constantly changing. It is important to verify the website through research and digital

referrals from other reputable websites before using these for stories and/or investigative pieces. Digital scams and/or very expensive software marketing can occur, and it is best to research all digital tools before engaging. Starting with the Society of Professional Journalists's Journalist's Toolbox is one way to stay up-to-date with the latest multimedia tools as it is updated frequently as of 2021.

DIGITAL SOUND

Digital sound enables journalists to record natural sounds, interviews, and speeches, and to combine and edit those sounds for newscasts, podcasts, and other content formats. Technological advances in digital recording make it possible for news reporters to collect professional quality sound elements of news events, such as natural sounds, sound bites, voice-over and narration, news packages, and program length productions.

“Digital sound” refers to numerical audio techniques used to capture, manipulate, store, and distribute sound. The word *digital* describes a binary numerical encoding process used to represent sound vibrations. “Sound” is an air pressure wave that is described by frequency (pitch), amplitude (loudness), and velocity (speed). “Audio” refers to either analog or digital processes for converting acoustical sound into a corresponding energy form (analog) or numerical representation (digital). Although “digital sound” is used to refer to this process, the term *digital audio* more accurately describes this numerical technology. This entry first discusses the origins and technical specifications of digital sound. It then looks at how digital sound is used by the news media and how it is distributed.

Origins

Digital sound builds on the fundamentals of analog audio technology, including the phonograph, gramophone, photographic sound on film, magnetic tape, and microphone, loudspeaker, telephone, and radio. These early technologies made

it possible to record, mix, balance, edit, process (alter sonic characteristics), and disseminate in monophonic (single channel), stereo (two channel), and multi-channel (four or more) audio.

Digital audio systems convert analog sound vibrations into discrete numerical values using a binary coding system of zeros and ones to represent numerical values as electronic pulses. Telegraph Morse Code, developed by Samuel F. B. Morse (1830s), was an early binary device that used electrical pulses (dots, dashes) to represent letters and numbers. Harry Nyquist (1929), a Bell Telephone Laboratories physicist, is credited with the idea for binary coding. His “Nyquist Theorem” states that the sampling rate in a binary system must be at least twice the frequency of an original analog signal. In 1937, pulse-code modulation (PCM), a system for encoding the quantities of a digital signal, was invented by Alec Reeves, an International Telephone & Telegraph scientist.

In 1967, NHK in Japan developed the first digital PCM audio recorder and pioneered much of the early work in their design. Denon recording engineer Takeaki Anazawa used a variation of this recorder to produce the world's first commercial digital recordings in 1971, “The World of Stomu Yamashita” by Japanese percussionist and composer Stomu Yamashita, and “Something” by American jazz saxophonist Steve Marcus. However, while these recordings and others were digitally mastered, analog media such as vinyl records were used for another decade for mass market consumption. The joint release of the audio compact disc by Sony and Phillips in 1982 would change this—enabling the distribution of up to 74 minutes of uncompressed digital audio including two channels of stereo bitstreams encoded with linear pulse-code modulation (LCPM).

How It Works

In digital audio, the waveform of a sound is partitioned into discrete units called *samples*. The number of samples taken each second, measured in kilohertz (thousands of times per second), varies according to the digital system. Fidelity is determined by three variables: *sampling rate*, frequency measured in kHz; *bit-depth*, a measure of amplitude; and *bit rate*, bits per second transmitted during playback or streaming. All things being equal,

the greater the sampling rate and bit-depth, the greater the overall sound quality.

An analog-to-digital converter is used to record, store, and transmit an encoded signal. Each audio sample, measured as electrical voltage, is represented using a binary digit system. This “coding” process is the “digital” part of digital audio. During playback, a digital-to-analog converter is used to change the digital signal back to an electrical signal and then to acoustical vibrations, which may be heard using headphones or a loudspeaker. The resulting sound is a facsimile of the original sound represented by a digital system.

The *Red Book* standard established for audio compact disk set the consumer audio sampling rate at 44.1 kHz with a 16-bit bit depth. A slightly higher sample rate and bit depth of 48 kHz/16-bit is recommended for digital video and HDTV applications. Higher sampling rates ranging from 96 kHz to 192 kHz are usually combined with a 24-bit bit depth for professional mastering applications.

Digital audio may be represented and stored using a variety of devices, including linear magnetic tape, optical and solid-state media, such as digital audio recorders, cellular telephones, and computers. These devices can store vast amounts of digital audio information. Today, most audio recorders intended for professionals or prosumers (those who both produce and consume media) utilize *secure digital* or SD cards, an international file-based standard released in 1999 by the SD Association, a consortium started by Panasonic Corporation, SanDisk LLC, and Toshiba Corporation.

In file-based recording, codecs and container formats are used to encode and “wrap” digital audio bitstreams. A *codec* (short for coder-decoder) is a mathematical algorithm used to arrange the underlying bits (zeros and ones) to conform to a particular standard. In decoding, a digital device or software application must be compatible with a given codec to accurately reproduce it as audio during playback. A *container* or *wrapper* format holds related audio bitstreams. For example, in a digital stereo recording, the left and right channel audio streams are encoded using a designated codec, and then bundled together in a single container file for processing or distribution.

Pulse-code modulation is an example of a digital audio codec. A variation of the PCM codec

called *linear pulse-code modulation* (LPCM) eventually became the international standard. LPCM is most often associated with the ubiquitous container formats AIFF (developed and released by Apple in 1988) and WAV (developed and released by Microsoft in 1991). Technically speaking, AIFF and WAV are audio wrapper formats used for bundling LPCM encoded bitstreams in a single data file. In terms of the codec, they are virtually identical. Only the wrapper is different, making them interchangeable formats for editing on a Windows OS or MacOS computer or device.

To save space, compression algorithms have been devised to reduce file size and the amount of space required for storage and data transmission. Digital compression is achieved by reducing the amount of redundant information in the underlying file data. In 1988, the ISO/IEC established a working group called the *Moving Picture Experts Group* (MPEG) to develop open standards for digital audio and video encoding. The first set of standards were published in 1993 under the name MPEG-1 and included technical specifications for the MP3 audio compression format. MP3 compression, which used lossy compression to reduce the size of an uncompressed WAV or AIF file by a ratio of 10:1, quickly became the worldwide standard.

Released in 1996, MPEG-2 introduced Advanced Audio Coding (AAC), a codec that extended the two-channel stereo capabilities of MP3 to multi-channel surround sound, such as Dolby Digital 5.1 and 7.1 (AC3). In response to the limitations of MP3, Apple used AAC encoding to create a proprietary variation of the standard called M4A. The M4A codec offered smaller file sizes with higher quality and became their primary format for music purchased through iTunes and used with other Apple products. It is also used for encoding the audio bitstreams in the popular MP4 video container format. The process of converting a file from one format (or codec) to another, such as in WAV to MP3 conversion, is called *transcoding*.

Digital Sound and the News Media

Between 1970 and 2000, digital recording devices appeared in radio newsrooms. These devices included stationary (reel-to-reel) and rotary magnetic head digital audio recorders; digital tape cartridge (“cart”); Digital Audio Tape (DAT), a

linear cassette tape format; the shirt-size portable MiniDisc, recordable and rewritable compact disc, and hard disk and solid-state recording devices. These devices, proprietary digital audio “workstations,” and audio software programs and systems (e.g., Avid ProTools, Adobe Audition, Audacity), were readily adopted by broadcast journalists for recording speeches and interviews, to record and playback actualities (sound bites) and organize and manipulate audio elements during newscasts.

Mobile technologies, including smartphones, Wi-Fi (wireless fidelity) and cellular networks, tablets, and a host of social media platforms and audio recording and editing apps, created opportunities for a new type of professional newsgathering known as *mobile journalism*. Since then, digital devices have been used to record both audio and video content of news events, such as the Iraqi War and the Madrid and London bombings in the early 2000s, although this represented a very small part of coverage from user-generated (eyewitness) content, citizen journalists, and professional journalists.

Distribution of Digital Sound

Digital audio is transmitted and received using over-the-air radio and television, wired and fiber-optic cable, and satellite technology. HD radio (high-definition radio) provides digital quality digital audio over existing AM and FM radio frequencies. Subscription satellite radio services, such as SiriusXM, beam digital audio directly to automobiles and portable receivers. More recently, streaming and webcasting have made it possible to receive uninterrupted digital signals. Computer technology also makes it possible to download digital audio in nonstreaming formats, which has led to podcasts, which are typically spoken word programs produced as series to download and listen to on digital devices. By the early 21st century, consumers regularly used their smartphones to access a variety of digital audio content.

DISCUSSION BOARDS

Discussion boards, also known as *electronic bulletin boards* or *message boards*, are used to host Internet forums in which participants with shared interests exchange messages on a wide range of topics—from politics, the environment, education, and religion, to sports, fashion, video gaming, and parenting.

As one of the earliest formats for fostering virtual communities over the Internet, discussion boards were extensively used in the movement toward enhancing a deliberative democracy—by providing the means for facilitating the exchange of online messages with users sharing experiences and ideas. News organizations were early adopters of the technology, hoping to increase the economic value of their online presence by generating traffic and providing a source of entertainment. However, as social media and other new technologies arose during the early years of the 21st century, the number and importance of discussion boards dropped precipitously. This entry discusses the origins of discussion boards, their functions, and their implications for the news industry.

Origins

A precursor to Internet-based discussion boards was the dial-up bulletin board system, or BBS, which is a computer system with software that allows its operator to download and archive data

files and software programs. The first BBS was the Computerized Bulletin Board System in Chicago, created by Ward Christensen and Randy Suess; it launched on February 16, 1978. It was not long before other BBSs were appearing across the country.

Users could connect via a modem and phone line to the system to access the archive and exchange electronic messages with other users. BBSs grew in popularity, reaching their peak in the mid-1990s with over 60,000 in the United States alone. BBSs were seen as an ideal environment for online socializing and virtual-community building—from international social movements, such as PeaceNet and its work on international relations and human rights, to individuals communicating about health and parenting issues.

With the explosion of the World Wide Web in the mid-1990s, bulletin boards shifted to web-based applications to connect users and facilitate the exchange of messages. However, where there is limited access to the Internet, primarily outside the United States, dial-up BBSs continue to provide a venue for exchanging messages.

A notable example of an early BBS, the Whole Earth 'Electronic Link (WELL) began in 1985 as one of the first virtual communities. While the WELL was one of the original dial-up BBSs, it became an early web-based community when the Internet opened to commercial business in the early 1990s. The WELL has a rich history as a meeting place for Grateful Dead fans and as the originator of ideas that shaped the online ads site Craigslist. The community also quickly caught the attention of journalists, who became some of its early members, bringing media attention to the deliberative potential of virtual communities. The WELL was such an important space that it was bought by the online media company Salon in 1999. But as its user base shrunk (from a high of as many as 10,000 users to a fraction of that) and other online meeting places emerged, the WELL became less important. Salon put it up for sale in 2005 but had to wait until 2012 to find a buyer: The WELL Group (a group of 11 investors and community participants) which bought it for a reported \$400,000.

During the late 1980s and early 1990s, journalists began to adopt electronic discussion

boards as one early stage of online journalism. The Albuquerque Tribune's electronic newspaper, the Electronic Trib, The Charlotte Observer's online site, the Observer, and The Spokesman-Review's site, Minerva, are early examples of the use of discussion boards in journalism. Engaging citizens by fostering deliberation and community building was seen to fit nicely with journalism's mission and role in a democracy. During the 1990s, news organizations practicing what became known as *public* or *civic journalism*, a reform movement to improve news practices and fulfill the democratic potential of journalism, were early adopters of discussion boards. Newspapers, with circulation increasingly in decline, saw their online sites and use of Internet forums as a way to attract and engage news consumers and maintain economic viability.

Functions

However, the Internet and these new virtual formats have presented a major challenge to the traditional model of disseminating news. Prior to the Internet, journalism was based on a one-way communication model, with information flowing from the news organization to a wide and largely passive audience. The power to decide what is news was in the hands of news professionals.

Along with rapid innovation of web-based technologies came the means by which users can interact with a news organization and each other about shared interests. As a fundamental feature of online news, interactivity means that users are able to more actively participate in the production of news. Ordinary citizens now have the opportunity to participate in a number of communication activities, ranging from simply engaging in discussions with others around shared interests to actively deliberating solutions to common problems.

This multidirectional, interactive model of journalism, however, was seen by some journalists as a threat to their professional domain. With online users more actively engaged in the news production process, often acting as sources of news, journalists had to grapple with ways to embrace this interactive format with its new definitions and practices of what "news" is.

As an Internet forum for hosting online discussions and posting information, discussion boards are part of a larger category of online types of user-generated content (UGC). It is, thus, important to understand the specific structure and functions of discussion boards that set them apart from other modes of Internet-based communication (email lists, Usenet, newsgroups, Internet relay chat) and types of GGC (blogs, wikis, social networking sites), where ordinary citizens are given the means to publish content for public consumption.

To begin, email lists represent a specialized mailing list organized around specific topics, with new messages posted to the list by members and transmitted to all subscribers via email accounts. They can either be edited or not by a moderator. Discussion boards, on the other hand, are created by organizations to host ongoing discussions on a range of topics of interest to registered users of their online sites. Unlike email lists, discussion boards require users to actively seek out the host site to join the discussions. However, discussion board moderators have the option of using email to invite users to visit the site by notifying them of new posts or encouraging them to post a topic of their own.

While similar in function to newsgroups, in which users post messages on a wide range of topics, discussion boards use different technology. Usenet newsgroups are hosted by a network of servers to store and forward messages; they require a special software program on a user's computer, called a *newsreader*, to participate in discussion. Discussion boards, on the other hand, require only a web browser for participation. (The distinction between discussion boards and Usenet newsgroups, however, has diminished since Google's 2001 acquisition of DejaNews Research Service, a Usenet message archive. With its web interface, the Google Groups service offers users the ability to access, post, and search the archive without a newsreader.)

The speed of communication provides another important distinction between various types of virtual communication strategies. Internet relay chat (IRC), in which messages are exchanged in real time, is a type of synchronous communication that occurs at a speed fast enough to simulate a face-to-face conversation. Discussion boards, on the other hand, provide the means for asynchronous

communication, in which messages can be posted and retrieved at different times.

With asynchronous communication comes the need to organize messages and ease the process of following online discussions. Software applications help users read online discussions by applying specific organizing strategies. One method is to display messages in a flat, linear fashion organized by date and time in chronological order. Another method is to group messages hierarchically by topic in a threaded discussion, or "threads." Threads are effective because they help users grasp the structure of a particular discussion, especially a long and complex one, and identify participants to whom they want to respond.

Membership in Internet forums can range from anonymity to full disclosure of identity through a registration process. Forum moderators, usually either the webmaster or a select group of users, perform as gatekeepers by eliminating content considered illegal, abusive, disrespectful, insulting, obscene, or completely irrelevant to the discussion topic. While rules may vary between sites, moderators assure that users follow the forum's rules of etiquette, or netiquette.

While not as prevalent in journalism as they once were, electronic discussion boards are still found on some news sites. The Washington Post's critically acclaimed online site, through its live discussion feature, serves as an example of how mainstream news media continue to take advantage of discussion boards to give readers a chance to communicate with writers, editors, and subjects of stories.

While news sites mostly gave up on discussion boards, they can still be found as dedicated sites catering to niche audiences. For example, GitHub is a popular social networking site for programmers, and also a code sharing and publishing service. Stack Overflow is the largest online community for developers to learn and share programming knowledge and build their careers. GameFAQs, launched in the mid-1990s and bought by CNET Networks in 2003, hosts more than 200,000 message boards focusing on every aspect of videogames.

While niche sites are important, the best-known discussion boards as of the start of the 2020s were far from niche: Reddit and Quora. Reddit, launched

in 2005 and with 330 million active users in 2019, is a hybrid: part social news aggregation, part web content rating, and part discussion website. Reddit was the fifth most visited website in the United States in 2019. Quora, launched in 2009 and with 300 million active users in 2019, is a question-and-answer website where questions are asked, answered, and edited by Internet users.

Ultimately, much of the online socializing that was the heart of discussion boards has shifted to alternatives such as Facebook Groups and Twitter. But as an early software system that paved the way for the shift from a traditional one-way model of journalism to the current interactive model, discussion boards were a vital step to allowing citizens to exchange ideas, engage in conversation, build community, and participate in the production of news.

DISTRIBUTION

Newspaper distribution has evolved over time with the growth of urban centers and improvements in transportation. Millennia ago, *Acta Diurna*, the reports of the Roman Senate, were proclaimed in the Forum and delivered by courier to the homes of senators, then by horse and ship to officials throughout the empire. During Venice's war against Dalmatian pirates, scribes in the Kingdom of St. Mark (Venice) wrote news accounts that were posted on walls and sold in piazzas; a few individual copies were sold for a *gazetta*, the smallest coin.

In the 21st century, newspaper distribution faces additional challenges inasmuch as newspapers and their distribution are energy and resource intensive. Except in smaller towns, youth carriers have faded into history, and increased reliance on telephone sales and heavy subscription discounts have not generated comparable sales success. The newspaper distribution system, dependent as it is upon readership levels and the appeal of a hard-copy newspaper, seems likely to continue its evolution, especially in major metropolitan areas.

Development

Johannes Gutenberg's printing press of the 1450s increased the number of copies produced in a day, allowing and encouraging wider distribution at lower cost. In 1611, Nathaniel Butter hired buxom "Mercurie women" to attract buyers for his paper on street corners. Street kiosks, booksellers, and postal systems became common methods. Ships brought European newspapers to American colonies and carried colonial newspapers back to Europe.

Benjamin Franklin, who began as a printer's devil and newspaper carrier for his brother's *New-England Courant*, became a newspaper publisher and postmaster for the colonies. His reforms of the Royal Post improved newspaper distribution by cutting delivery times in half and by allowing newspapers to move between post offices at no charge. President George Washington authorized construction of all-weather "Great Post Roads" from Maine to Georgia and New York to Kentucky to unite the country by assuring speedy delivery of mail and newspapers. The reluctance of subscribers to pay for their newspapers forced publishers to beg postal carriers to

collect the fees. As the first U.S. postmaster, Franklin added another reform: postal carriers paid publishers in advance for every subscription, and then had to collect from subscribers.

In 1833, Benjamin Day introduced the most significant changes in American newspaper distribution with his daily *New York Sun*, the first “penny paper.” Day copied a London distribution method suited to a working-class readership. Newsboys bought the *Sun* at wholesale rates (66 cents for 100 papers) and sold the papers for one penny. Enterprising newsboys sold the *Sun* on street corners and built routes of subscribers. By letting newsboys profit from distribution, Day enabled them to earn more than adult laborers.

Day’s model (made possible because advertisers paid 80 percent of his production cost) spawned dozens of imitators. Philadelphia merchants insisted on knowing the names of a newspaper’s subscribers before buying advertising space, so Philadelphia publishers required carriers to provide a current subscriber list. Adults, drawn by the potential profits to be made, began selling papers. Some became brokers, buying papers from every

publisher and reselling them to newsboys and retailers. By 1850, such brokers controlled newspaper distribution in every major city, even negotiating wholesale rates with publishers and setting profit margins for carriers and retailers.

By the 1840s, railroads moved newspapers for both publishers and brokers, and newsboys began selling papers on commuter trains. As railroads pushed west, Horace Greeley introduced a *Weekly Tribune* distributed through the Midwest to the Rocky Mountains. A. S. Tuttle, the largest New York broker, had his own railroad cars to serve dealers. His company grew into American News Company, which owned or controlled over 20,000 newspaper distribution agencies across the United States. Publisher James G. Bennett challenged the brokers’ control by hiring his own distribution force and cutting the paper’s price in half, but failed to break their dominance. Brokers controlled distribution until 1922, when the U.S. Supreme Court ruled that they illegally constrained trade. Major newspapers regained control over their distribution and contracted with local brokers for distribution in other towns.

Man buys a copy of the *Evening Star* from a newsboy in Washington, DC, during World War I. The paper’s headline reads “U.S. at War With Germany; President Signs Resolution.”

Newsboys, Social Changes, and Distribution Wars

After the Civil War, rapid growth of cities and the rise of labor unions prompted publishers to create the position of circulation manager. By 1875, the distribution process included newsboys and youth carriers, adult carriers, newsstands, booksellers and other retailers, railroads, and post offices. Distribution issues included understanding postal rates and regulations, setting press schedules to railroad timetables, building subscription drives, and negotiating annually with wholesalers, teamsters and other unions. The International Circulation Managers Association (ICMA), established in 1898, offered training and updates and lobbied Congress for favorable newspaper postal rates and regulations.

Social reformers periodically focused on newsboys in their campaigns against child labor. Newspapers defended their reliance on youth, but also solicited donations of winter clothing for newsboys and hosted summer picnics. Scripps newspapers required youth carriers to maintain passing grades in school and employed tutors. Newspapers pointed out that they taught their “Little Merchants” the fundamentals of business: buy wholesale, sell at retail, and serve customers. State legislatures responded in the early twentieth century by setting a minimum age for youth carriers, typically 10 or 11.

Because weeklies, including religious and non-English-language immigrant newspapers, largely were distributed by mail and retailers, they shared few of the distribution problems of dailies. Publishers of all newspapers considered circulation figures a trade secret until the U.S. Postal Act of 1912 required an annual circulation statement from every publication delivered through the postal system. In 1913, the Audit Bureau of Circulations was formed to provide standardized and audited figures. Even for weeklies, distribution now included careful accounting of each day’s net paid circulation by subtracting from total circulation the unsold papers and those sold at less than half price.

By the early twentieth century, circulation competition became a war for survival. Improved printing presses pushed daily capacity beyond 100,000 copies. Advertisers preferred to place ad support with the newspaper with the largest circulation simply because it was more efficient. Subscription campaigns sent youth carriers door-to-door several times each year. New subscribers were offered

silverware, china, life insurance, and hundreds of other gifts. To increase circulation, metro newspapers used trucks as well as trains to expand distribution into adjacent counties and states, competing with small daily and weekly newspapers. In Chicago, the circulation war turned violent when circulation managers hired thugs to disrupt their competitors’ distribution. Trucks and newspaper bundles were stolen, newsstands set ablaze, dealers beaten up, and at least one youth carrier was shot (1916-20). Chicago American circulation manager Moe Annenberg was said to practice his distribution techniques in the newspaper’s basement shooting range.

By 1932, “shopper” newspapers began to threaten dailies with a radically new distribution method. Shoppers were delivered free to every household in a defined geographic area. Advertisers gladly paid the low ad rates in return for 100 percent distribution. Daily publishers petitioned city councils for anti-littering ordinances limiting distribution of newspapers only to people who requested them. The ICMA successfully lobbied Congress for a postal regulation limiting the use of mailboxes to items delivered by postal carriers. As a result, the shoppers quickly disappeared. Many metro dailies opened radio stations in the 1920s to boost sales, but in 1933, the “Press-Radio War” broke out because publishers were upset by declining newspaper advertising. The newspapers quickly ended the confrontation when advertising failed to increase.

Mergers increased as publishers bought struggling competitors, consolidating printing and distribution. To increase profits, newspapers used their carrier force to deliver magazines such as *Saturday Evening Post*. Still, nearly 400 daily newspapers closed during the Great Depression, and another 200 dailies went bankrupt during America’s involvement in World War II (1941-45) despite the freeze on circulation imposed by newsprint rationing.

Social changes after World War II brought serious new distribution problems. Foremost was the rapid growth of suburbs coupled with the rise of television. By 1955, television was the dominant entertainment medium, displacing both film and general magazines. Television news, however, grew more slowly. Live coverage of the aftermath of John F. Kennedy’s 1963 assassination and funeral made it clear newspapers faced a serious competitor.

Suburbanization, Migration, and the End of the “Little Merchant”

Low mortgage rates for veterans combined with mass construction techniques created vast tracts of suburban homes on formerly rural land. Metro newspapers worked feverishly to build efficient distribution networks to reach and cover the suburbs; local weeklies and small town dailies had thousands of potential new readers to serve. The 1956 Interstate and Defense Highway Act authorized a freeway system that promised speedy distribution to suburbs and outlying towns, as well as among cities. Over the next two decades as they tore up and divided inner cities, freeways encouraged families to move farther from the central city and to commute by auto. Growing traffic congestion steadily diminished the ability of afternoon papers to provide timely distribution. As suburban commuters abandoned mass transit for automobiles, afternoon metro editions slowly faded into oblivion. Living in another county distant from the central city, suburbanites needed only a single daily newspaper to complement television and drive time news. Suburban growth allowed publishers to create newspaper “rings” surrounding big cities in the late 1960s. Distributed exclusively in suburbs through the postal system and retailers, the rings comprised weeklies in previously rural towns and new weeklies where needed. Metro newspapers responded by reworking distribution to ensure delivery of new suburban news sections to the appropriate carriers and news dealers.

ICMA’s Newspaper in Education program begun in the 1960s by several major dailies, sought to build present and future readership among schoolchildren. Teachers were paid to attend a summer training program on newspapers as a classroom supplement. Class sets of newspapers were delivered at wholesale rates, and experienced teachers were hired to teach new participants.

The Wall Street Journal began using space technology in the 1970s to provide timely delivery to its national readership. Page layouts were transmitted by satellite to regional printers who then distributed newspapers. Newly developed offset printing plants saved hundreds of weeklies from bankruptcy in the 1960s by creating jointly owned offset printing plants that could take advantage of cheap in-county postal rates.

A series of problems forced massive distribution changes among metro dailies in the 1970s. The elimination of daily transcontinental train service forced some to abandon distant subscribers. Disaster struck in 1974. Gasoline prices quadrupled almost overnight; shortages were common. The postal system substantially increased its rates. Skyrocketing costs forced newspapers to limit distribution to primary readers and eliminate distant “ego” circulation.

Youth carrier shortages became a crisis in the early 1980s. As family size declined with birth control, legal abortion, and dual income households, many families refused to complicate family life with a daily newspaper route. At first, girl carriers eased the shortage, but many parents refused to let their daughters deliver in predawn hours, particularly after a highly publicized kidnapping in Des Moines, Iowa, in 1980. The shortage of youth also crippled door-to-door sales campaigns because youth doubled as a potent sales force. Telephone sales efforts increased, but they could not match the effectiveness of youth carrier begging subscriptions at the front door. Reluctantly, even small city newspapers converted youth routes to motor routes run by independent contractors or contract delivery agents.

In the late 1970s and early 1980s, factory closings in the industrial Northeast and upper Midwest (the “rust belt”) coupled with construction of new factories in the South, created a massive migration of laborers to warm weather states (the “sun belt”) where they joined retirees. This aggravated the flight of white subscribers to the suburbs spurred by, urban race riots (1965-69). Inner cities became concentrations of poor and unskilled laborers living around abandoned factories and railroad yards—and rarely reading newspapers.

Rust belt metro newspapers restructured delivery routes for their declining number of inner-city subscribers while simultaneously trying to follow their subscribers to the suburbs. Rising inner-city crime rates made carrier safety a priority. To prevent robbery, newspapers abandoned carrier collection, requiring prepayment by credit card or check. Steadily, motor routes replaced inner-city youth carriers.

Sunbelt newspapers raced to build distribution networks for sprawling tract developments and planned communities of retirees. In Florida, the

“Snowbirds,” Northerners who moved there for the winter months, required special delivery routes and subscription packages. Dallas, for example, grew into a major financial center with large numbers of business professionals whose work took them out of the city from Monday through Friday. Special weekend home delivery subscriptions became part of the distribution for the *Times* and *Morning News*.

Late-Twentieth-Century Challenges

An array of problems arose from the changing pattern of urban life as gentrification replaced urban blight in the 1980s. High-security apartments, which attracted middle-class tenants, denied carriers access for delivery. Gyms, shopping malls, television, and evening recreation consumed free time formerly given to newspapers. Increasing numbers of single-copy boxes seemed the only reliable solution. Three Sigma, a major research study, found in 1983 that one in three readers had not seen the previous day's newspaper, nor were they likely to see the paper of the next day. Young single males, the least frequent readers of weekday newspapers, were the most frequent readers of weekend editions. Every daily newspaper sought solutions to these problems.

In the late 1970s, afternoon metro newspapers had begun shifting to morning distribution; others began disappearing through bankruptcy or merger. The *Philadelphia Bulletin*, which had pioneered the use of delivery trucks in 1898, found rush-hour traffic made it impossible to guarantee home delivery to suburban subscribers by 6:30 p.m.; it closed in 1982. In the Sunbelt, afternoon distribution proved futile, because readers preferred outdoor recreation and other activities. Afternoon distribution remained successful only in small cities and towns.

USA Today devised another distribution strategy in the early 1980s: offer bundles to hotels and airlines at a huge discount and flood cities with single-copy boxes shaped like television sets. Created for business people, travelers, and occasional newspaper readers, it quickly became a staple in retail outlets. The paper promoted its total circulation, rejecting the Audit Bureau of Circulation's formula for paid circulation, a much more conservative figure. Like *The Wall Street Journal*, *USA Today* relied on a regional distribution system built around printers who received page layouts by satellite.

Shopper newspapers returned in the 1980s with a new distribution strategy. In cities, they gave away copies through single-copy boxes. In rural areas, they placed their own delivery boxes next to rural mailboxes for motor route delivery. By guaranteeing 99 percent household penetration, shoppers competed for classified legal advertising and advertising inserts. Courts upheld shoppers' right to compete for legal classifieds because of their extensive distribution. Loss of advertising revenue forced dailies to build competitive distribution routes; many created a weekly edition delivered to nonsubscribers and rural boxes. The shopper model was mirrored in a host of free special interest and neighborhood newspapers delivered to homes, to open racks, and were left by the bundle in lobbies, skywalks, restaurants, and coffee shops. Metro newspapers devised methods for precise delivery of local sections to the neighborhood route level.

Around San Francisco Bay, weeklies and dailies experimented with distribution techniques to attract the affluent readers advertisers sought. In the “den mother” system, women trained and managed youth carriers who were paid to deliver to every home. These mothers trained carriers to put the paper on every porch in a prescribed fashion, spot-checked their performance weekly, and taught carriers how to go door-to-door seeking voluntary payment for the paper. Others saturated defined areas with free newspapers thrown on the driveways. Rows of single-copy boxes and open racks of free papers lined sidewalks wherever people congregated—in shopping centers and near restaurants, for example. Free copies were pressed into the hands of people attending events or returning to their cars in mall parking lots.

As newspaper readership declined in the late twentieth century, executives turned to marketing experts. Advertisers sophisticated in target marketing demanded specifics about readers and subscribers. Newspapers restructured to combine advertising and circulation in a marketing unit. As a sign of the times, in 1992 ICMA merged with six other trade groups (American Newspaper Publishers Association, Newspaper Advertising Bureau, Association of Classified Advertising Managers, International Newspaper Advertising and Marketing Executives, Newspaper Advertising Co-op Network, and Newspaper Research Council) to

create the Newspaper Association of America, now the News Media Alliance.

Low readership among young adults led metro publishers to create special tabloid newspapers delivered free on subways, in open racks, and even home delivered in targeted neighborhoods. Written in the style and language of young adults, papers like the *Chicago Tribune's RedEye* attract an audience reluctant to seek traditional newspapers.

roles effectively constantly update their knowledge about the various groups that make up a society. However, sometimes they fall short in doing so.

The failure of many U.S. journalists and news organizations to report fairly on various peoples and cultures within the United States is generally attributed to a variety of factors that can be summarized into two categories: (1) lack of diversity in newsroom employment or among the people who comprise the journalist workforce; and (2) the lack of diversity in how news about racial and ethnic minorities is reported. This entry discusses these two issues along with possible strategies to improve diversity in journalism. Throughout this entry, two terms and the variations of these terms are used interchangeably to refer to the racial designation of non-white persons in the United States: *marginalized*, and *person of color*.

Diversity in Newsroom Employment

Over the years, news media have been accused of presenting biased news reports about non-white people. The 1968 report of the National Advisory Commission on Civil Disorders, known as the *Kerner Commission*, concluded that the media fell short in reporting accurately on the life of racial and ethnic minorities and poor people in the United States. The Kerner Commission also found that the journalism profession had been “shockingly backward in seeking out, hiring, training and promoting Negroes” at the time their report was released (p. 211).

In the decades since the Kerner Report was released, a number of U.S. professional news organizations have attempted to address problems associated with reporting on Black people and other racial minorities. The American Society of Newspaper Editors (ASNE) created a Minorities Committee in 1977 and pledged that it would work to achieve racial and gender representation in newsrooms equal to that in the total population before the year 2000. A decade later, and after realizing it would not meet the 2000 goal, the board set a new goal to reach parity by 2025 or sooner and recommended that 3-year benchmarks be used to better track progress. Starting in 1997, ASNE launched the Newsroom Employment Diversity Survey (previously known as the

DIVERSITY IN JOURNALISM

Journalists have the responsibility to verify facts and report accurately on the people and events they cover. Journalists who desire to execute these

Newsroom Employment Census). Conducted annually, this tool measures the organization's success toward its goal of having racial and gender representation in newsrooms nationwide match that in the nation's population by 2025.

A total of 429 news organizations participated in the 2019 ASNE survey. Of this total, 267 were newspapers, and 65 were online-only news sites, comprising a 22.8% response rate, which was an increase from a historic low of 17% for the 2018 survey. Although the annual survey is still a trusted source for documenting statistical information about newsroom employment, it is noted that news organizations participate in this survey on a volunteer basis. As such, the data cannot be used to generalize about the state of minority employment in U.S. newsrooms.

Salaried Newsroom Employees

Results for the 2019 survey revealed that people of color represented 21.9% of the salaried newsroom workforce. The percentage of women in the journalism workforce was 41.8%, nearly identical to the previous year's numbers. Women also made up 50.1% of salaried employees at online-only organizations, up from 47.8% the year before.

ASNE also reached out to gay, lesbian, bisexual, or transgender journalists in 2019 and found that of the 200 who replied, most identified as white, 7.5% identified as African American or Black, 7.5% identified as biracial or multiracial, and almost 3% identified as Asian.

Online-Only Newsroom Employees

The 2019 survey also revealed that journalists of color comprised almost one third of the journalists who held full-time jobs at online-only news organizations. This represented an increase over the previous year in which people of color comprised 25.6% of journalists employed in online-only newsrooms.

Television and Radio Newsroom Employees

By June 2019, the percentage of women and people of color in television newsrooms reached record highs for the second year in a row, according to the Radio Television Digital News

Association 2019 Annual Newsroom Survey. In addition, the number of general managers of color was up for the second year in a row, and there were more women in the local television and radio news workforce and in leadership roles than ever. The local radio workforce of color also experienced peaks by reaching the highest it had been in more than 20 years, including the percentage of radio news directors of color peaking at its highest level in five years.

Retention and Advancement

While diversity of employment in a newsroom can be an effective method for incorporating a wider range of views into news coverage, it is not the only way to diversify coverage and voices. Journalists themselves have worked to create new programs, training, and pipelines leading to diversity in journalism. For example, investigative reporting is one of the most important activities that journalists do in a democracy, and these positions are filled mostly by white journalists, particularly those who have received the level of mentoring and training that is needed to flourish in these jobs, observes Farai Chideya, journalist and program officer for Creativity and Free Expression at the Ford Foundation. This type of disadvantage is what inspired *New York Times* investigative reporter Nikole Hannah-Jones to cofound the Ida B. Wells Society for Investigative Reporting in 2016. Its mission is to increase the hiring and retention of investigative reporters and editors of color and to educate news organizations about the role of diversity in enhancing the impact of investigative journalism.

The late Steve Buttry, former director of Student Media at Louisiana State University, writes that while some managers hire based on quotas, others prefer to avoid this strategy. Instead, they use aggressive recruiting approaches such as establishing internship or leadership programs that heavily target talent from underrepresented groups. In addition to diversifying job candidate pools, Buttry offers additional suggestions on what managers can do to diversify the newsrooms they oversee. He suggests avoiding placing too much value on experience, for doing so can repeat past discrimination. After all, if white males have traditionally had an advantage in newsroom

hiring, overcoming racial and gender bias cannot eliminate this type of advantage. Instead, he writes, diversity in life and familiarity with issues in communities that have been overlooked in coverage should be emphasized. He also encourages newsroom managers to just give minorities chances to progress that are similar to the ones he and his fellow white male colleagues received along the way. Specifically, he notes that many white males were given chances to move into supervisory positions in their early 20s. Similarly, he writes, employees from underrepresented groups could very well possess the same potential and promise that will enable them to be successful if they were promoted to supervisory and leadership roles early in their careers. Buttry also suggests that when an editor succeeds in removing barriers that allow outstanding racial and gender minority employees to advance, they should refrain from associating the move with the person's race or gender. Admitting they were the right choice for the job is sufficient enough.

Racial and gender minority newsroom employees also should be consulted about what makes them uncomfortable on the job, according to Buttry, as doing so might help improve diversity in retention as well. Specifically, he recommends editors and managers think beyond race and gender diversity. A lack of knowledge about religion, sexual orientation, and invisible disabilities could possibly lead to exclusion in hiring and in news coverage. In these cases, being open to learning about all aspects of diversity can reveal any unconscious biases one might harbor, which, in turn, could lead to the exclusion of potential newsroom hiring "fits."

Expanding sources is another strategy Buttry offers. This would require periodic audits of news coverage that explore whether most of the experts are white men. For example, an audit might reveal that whites tend to be interviewed for stories that emphasize academic accomplishment. If left unchecked, he writes, these repeated patterns of sourcing can result in an increase of positive stereotyping for one group and a decrease for another group.

In addition, Buttry suggests editors seek out regularly the advice of staff members who are not white males, and not just for matters of race or gender. Here again, this effort would require

getting to know these fellow staffers better as well as learning more about what interests them.

Diversity in News Coverage

In addition to working toward the goal of reaching newsroom racial parity by a certain date, journalism professionals and scholars have turned their focus to improving upon the Kerner Report's other conclusion: the news media's failure to analyze and report adequately on racial problems in the United States. This focus has been expanded to include reporting on domestic racial groups such as Asian Americans and Native Americans, and citizens who are members of the Hispanic and Latinx population. In addition, journalists are challenged with reporting accurately on issues unique to other marginalized groups including, but not limited to, women, citizens with disabilities, and those who identify as members of the lesbian, gay, bisexual, and transgender population, to name a few.

Rachele Kanigel, a professor of journalism at San Francisco State University, writes that while some may see attention to diversity issues in journalism as "political correctness," responsible journalists increasingly see such efforts as a way to serve their audiences. This is particularly true, she writes, in that the demographics of the United States are becoming more diverse each year, and the U.S. Census Bureau projects that by 2044 more than half of all adults in the United States will belong to a racial or ethnic group other than Caucasian.

How Lack of Diversity Can Affect News Coverage

A diverse newsroom can bring both profound and subtle impacts on the stories that are told. One example that is often discussed is how some news organizations tend to focus on the criminal backgrounds of police shooting victims. This practice can feed into stereotypes of the image that Black men are criminals, which suggests to some they had to have played a role in causing their demise. Having journalists of color in the newsroom might prompt discussions about why the victim's background is emphasized more than the police's decision to shoot the victim. Another

example is gentrification or the process of changing the value of a neighborhood by bringing in more affluent residents and businesses. In many cases, the resulting hike in property taxes forces poorer property owners into selling and relocating to more affordable neighborhoods. On one hand, a journalist who cannot identify with the plight of the original residents might see the new construction as a good thing for the city. On the other hand, a journalist who is familiar with the life experiences of the displaced property owners might be able to spot the overlooked story of how the new construction affects the less affluent residents.

In some instances, cultural understanding is necessary in ensuring stories reach the public. Consider the example of Oakland, CA, when in 2002 the number of homicides reached triple digits for the first time since 1996. David Yarnold, former editor of *The Mercury News* in nearby San Jose, CA, tells the story of how editors gathered to discuss how to report the rise in violence. The story quickly turned to what several editors called “black-on-black crime” because, as they pointed out, many of the deceased and perpetrators were African American. However, a Latina assistant city editor objected, along with an African American photo editor, who argued that the real story was not about race. Instead, it was about people killing people. Had the rise in violence happened in an affluent, predominantly white city, they asked, would they call it “white-on-white” crime? As a result of this input, the story ultimately ran as one that examined how young Oakland residents who live in the toughest communities were coping with the rise in violence.

Implicit Bias in Journalism

Implicit bias involves one’s immediate or unconscious response to associate certain characteristics with particular groups. All people, including journalists, possess these thoughts or responses consisting of deeply rooted stereotypes that can affect one’s actions in an unconscious manner. Issac Bailey, a journalist and author, has observed this happening in coverage of female politicians who are treated differently from male politicians in news coverage. With women candidates running for office, the focus is often about character traits and

less often about issues. Other examples include Blacks being unfairly associated with crime, and people from the Middle East with terrorism.

Sally Lehrman and Venise Wagner, both journalism scholars, write that a number of things can be done to minimize the influence of implicit bias. First, they suggest that reporters try seeing things from the perspective of a person with an identity different from their own. Doing so requires actively looking for people and ideas that run counter to their assumptions. They also recommend that journalists question their first response to a story or event and accept that gray details and other information might pertain to a story. That said, they advise that it is wise to check the reality one thinks they have seen and consider whether there is an alternative way of interpreting the information at hand. When this is done, cultural interpretations that were not considered might turn up. In addition, they write that getting to know all of the representative stakeholders in the area one is assigned to cover is important too, which includes getting to know people from a variety of racial and ethnic groups. Reading about different communities, watching documentaries about them, as well as working to build individual relationships with them can help in this regard.

Lehrman and Wagner also suggest journalists try gravitating less toward people with whom they perceive as being friendly or comfortable enough to be around. Instead, they challenge journalists to develop more relationships with people whom they feel uncomfortable being around. Specifically, when covering mundane stories, they suggest doing some background research on the event or issue to explore how the coverage might impact various constituent groups. This approach helps to guard against assuming one size fits all. They also write that when reporting on a story that impacts a community, one should work hard to be inclusive in reporting effects. Again, this calls for building relationships with people in different racial and ethnic communities.

Diversity Within Diverse Groups

Terms used to refer to ethnic and racial groups continue to evolve. While some changes are a result of personal preference, sometimes adjustments are needed because designations become

outdated over time and may carry negative connotations. When describing underrepresented groups, it is wise to be specific and sensitive to these issues. Following are a few guidelines to consider to help reduce bias in reporting about underrepresented groups.

Native People

A question many journalists often ask when covering Native issues is whether the term *American Indian* or *Native American* is appropriate. Cristina Azocar, chair of the Journalism Department at San Francisco State, writes that neither is correct. Instead, she explains that it is best to use the name of a tribe or the name of a nation: Lakota, Choctaw, Cherokee, Navajo, and so on. She points out that there's no agreed-upon name for the original peoples of North America, and many times, the terms that are used often elicit strong reactions from sources and readers. Azocar adds that Michael Yellow Bird, a professor of sociology and director of Indigenous Tribal Studies at North Dakota State University, considers the terms *American Indian* and *Native American* to be "oppressive, 'counterfeit identities.'" He prefers the terms "Indigenous peoples" or "First Nations" peoples. Azocar suggests that whenever possible, journalists should ask their sources which terms they prefer and proceed with identifying individuals by their tribe or nation.

Hispanics and Latinos

Similarly, it should be noted that diversity exists within the Hispanic and Latino populations in the United States. According to the U.S. Census Bureau, these two groups had reached 18.3% of the U.S. population in 2019, making them the largest ethnic minority. Still, the U.S. government does not consider Hispanic or Latino a race, albeit many Latinos do. Specifically, the U.S. Census Bureau indicates that Hispanic origin and race are two separate concepts, and people who identify as Latino or Hispanic can belong to any race, with most tracing their lineage to Mexico.

Asian Americans and Pacific Islanders

Kanigel writes that while many people of Asian descent embrace the term *Asian American*, others see it as an overgeneralization, thus forcing the

blurring of lines among people who trace their roots to very different countries and cultures. In fact, most Asian Americans trace their roots to one or more of 21 Asian countries, with the majority indicating their lineage traces back to China.

Hyphenation is another issue many Asian groups challenge. Kanigel writes that some Asian Americans, as well as people from other dual identity groups, take issue with the hyphen, as it makes them feel marginalized. Some just say it is incorrect or divisive. Authors of the *Conscious Style Guide* write

to many of us in the trade . . . many of the people we write about, those hyphens serve to divide even as they are meant to connect. Their use in racial and ethnic identities can connote an otherness, a sense that people of color are somehow not full citizens or full American: part American, sure, but also something not American. 'Hyphenated Americans' is one derogatory result of such usage.

Middle Easterners and North Africans

Diversity also exists among people living in the United States and who have originated from the Middle East and North Africa (MENA). Neheda Barakat, an Australian journalist with *The Guardian*, writes that it is common for journalists, politicians and others to mistakenly use the terms *Arab* and *Arab world* when referring to people from MENA. This trend began as early as the 1800s and has evolved as speakers continue to mash-up countries, ethnicities, religions, cultures, and languages associated with the MENA group. "To describe everyone who is Muslim or speaks Arabic as Arab is incorrect. Religiosity is not ethnicity and nor are they interchangeable," Barakat writes. Instead, Barakat recommends a more inclusive term such as people from the Arabic-speaking world.

Joe Grimm, a former editor with the *Detroit Press*, and Osama Siblani, founder and publisher of *The Arab American News* in Dearborn, Michigan, write that most Muslims in the world are not Arabs, and about 60% of the world's Muslim population lives in Asia. Arabic-speaking Americans and Muslim Americans are two distinct groups, but their communities do overlap. These experts note that it is important to understand that "Arab" is not a race, nor is it a nationality or

religion. It is a cultural or ethnic designation, and Arabic is the language of more than 20 countries in the Middle East and Northern Africa. Also, the nations and regions of the Arab world are not alike, and they do not all get along. Conflicts exist within the Arab world, just as they exist in other places.

Black Americans

Although Blacks living in the United States have histories tracing back to roots in Africa, not all Blacks in the United States share the same lineage and life experiences. Also known as *African Americans*, and once the largest racial minority in the United States, individuals in this group consist not only of the American descendants of slavery, but of Blacks who immigrated from countries in Central America, the Caribbean Islands as well as from the continent of Africa itself, among other places. For this reason, it is noted that African Americans born into families who have lived in the United States for centuries might hold views about issues such as racism that differ from Blacks who immigrated to the United States within the last half century or so.

Sexuality and Gender Identity

One of the biggest issues surrounding how the LGBTQ community should be covered is what it should be called. Traditionally, this group has used the term *LGBT*, which stands for lesbian, gay, bisexual, transgender, writes Kanigel. However, in recent years, she writes, they have begun to use *LGBTQIA*, as it is more inclusive of the “Q” for “questioning” or “queer.” The “I” represents “intersex,” for a person whose anatomy is not exclusively male or female, while “A” can stand for “ally,” which recognizes a friend of the cause, “asexual,” for someone who is not interested in or does not desire sexual activity, or “agender” for a person who does not identify as male or female. In addition, sometimes a + symbol is added at the end to represent inclusivity of all other possible sexualities and genders. As a minimum, Kanigel suggests journalists consider using the abbreviation *LGBTQ*, as this is the acronym the Association of LGBTQ Journalists uses.

People With Disabilities

Not all people with disabilities have disabilities that are visible or recognizable. As such, there are some recommendations on words and phrases to consider when reporting on this group, writes Kristin Gilger, director of the National Center on Disability and Journalism at the Cronkite School of Journalism and Mass Communication at Arizona State University. First, she writes, journalists should avoid using terms for conditions that have not been medically diagnosed, and they should be as specific as possible about the nature of the disability. For example, while Alzheimer’s disease is the most common form of dementia, other forms exist. Kilger also explains that it is not necessary to mention a person’s disability when the story has nothing to do with disability. Specifically, and whenever possible, she suggests journalists allow people who have first-hand experience with a disability to speak for themselves instead of assuming doctors, teachers, public officials, and the like are the best source for a story. People with disabilities are the experts on their lives, she writes, and other officials should be consulted only if the story calls for it.

Mental Illness, Suicide, and Substance Abuse

Mental illness, suicide, and substance abuse stories appear in the news daily, though most journalists who have to cover them have little training in counseling, or diseases of the mind, writes Kanigel. She suggests that when covering mental-health-related stories, journalists should start by asking three questions. First, they should ask whether mental illness is relevant to the story. If this is not the case, then there is no need to mention it. Second, they should determine whether there is a source for the mental illness diagnosis. If a person’s mental health condition is relevant, effort should be made to verify with certainty the person’s diagnosis. Third, once it is determined that the mental condition is relevant to the story, journalists should avoid using derogatory words, and be as specific as possible when describing a person living with a mental illness, as this will prevent advancing stereotypes.

Kanigel writes that similar precautions should be taken when reporting on substance abuse and

suicides. For example, when writing about drug abuse, journalists would benefit by understanding that addiction, like mental illness, is a disease and should not be used to label people. In addition, when writing about suicides, journalists should not go into detail about methods used. In 2015, *The Associated Press Stylebook* began listing guidelines for reporting on suicide, stating that they do not recommend covering suicides or suicide attempts unless the person involved is a well-known figure or the circumstances are particularly unusual or publicly disruptive.

DOCUMENTARIES

Documentaries are complex visual or audio storytelling forms that apply creative treatments to actuality, in the words of documentary pioneer John Grierson. Sometimes this definition has had a slightly different wording: “the creative interpretation of actuality.” The slight difference gives some sense of how elusive defining documentary can be. Despite the challenge, the consideration of how documentary can be defined both clarifies how we make sense of any single instance that bears the term *documentary* and advances how seeking a definition has provoked talented creators and interpreters of documentary stories to defy the definition and, in the process, rebuild it.

Documentaries can be very short or very long, they can be silent film or digital images, they can be images accompanied by different kinds of sound, and they can be just audio. To begin to

build a definition that clarifies the form, several conventional practices can be discussed, and following that, the form can be considered for all the ways the conventional practices are manipulated or confronted in a way that enhances the experience of the viewer.

Documentary Practices and Uses

As a starting point, documentary is a media form that observes, manipulates, and then redistributes stories about the world around us, within us, and beyond our sensory experience at micro and macro levels. Its origins are rooted in media that recorded things in the world, capturing images and/or sounds, and making them available in different times and spaces. Its ancestry can be split into the fields of observation like history, journalism, geography, and anthropology that used words and images to gather “facts” together and write them down for diverse distant audiences. Documentary has been used as well to consolidate and share accumulated knowledge from both hard and soft sciences, from the study of the natural world, to the investigation of psychological and sociological questions, to the historical exploration of politics, war, social movements, and to the lives of individuals, cultural groups, and their experiences in the arts, religion, and meaning. Along with these intellectual ancestors, documentary is a product of changes in technologies that can be used to record and preserve, from descriptive language and images, to photographic and audio technologies that fixed images and sounds into different media, to the distribution systems of radio, phonograph records, television, film theaters, and a wide range of digital distribution channels.

For most creators and audiences, documentaries tell stories that assert a notion of what is true or make an argument for the “truth” of a specific perspective or experience. Documentaries are stories featuring people pretending to be themselves. Creators make recordings of things in the world that they are either not making up or that are being made up for the purposes of audio and visual demonstration. The recordings of things in the world, and the constructions that illustrate things in the world, are then edited together into story forms that are influenced by related media

practices. For example, early film technologies were trying to find better ways to make moving photographs of things in the world in order to share how they look to audiences not actually present.

Origins in Motion Studies and Actualities

One of the most well-known of these predecessors to documentary are the motion studies of Eadweard Muybridge, who in 1872 took sequential photographs of a horse named Occident running in order to analyze how a horse ran. The pictures were commissioned by Leland Stanford, who also started Leland Stanford Junior University, or what is now known as *Stanford University*. Muybridge was doing observation science and was not concerned about the definition of “documentary” as we think about it. But seeing the way these motion experiments worked fundamentally changed notions of space and time.

These experiments in recording sequences of still photos that create the illusion of motion recorded are the foundation for the earliest documentaries. In France, the Lumière brothers made short documentary films, starting when they photographed workers leaving their factory in March 1895. Hand-cranked through a projector, the film was about 50 seconds long. Not much to tell a story, but revolutionary in what it suggested: that an incident in one place could be recorded, fixed in a medium, and transported for people to see in another place. The French factory workers on film were seen at a screening in Egypt in 1896. These early films were referred to as *actualités*. The complexity of moving and setting up equipment made the logical next move—to recording news events—more complicated, though prescheduled events were an early frequent subject. For other events, recreations were shot, suggesting that ideas of authenticity were not yet seen in documentary as clearly defined, and in many contexts that challenge of deciding the “authenticity” of a reconstructed actuality is still controversial.

A particular actuality document suggests a disturbing potential of documentary. On January 4, 1903, the elephant Topsy was electrocuted on Coney Island in New York City, after the animal killed a drunk spectator who burned the elephant

with a cigar. The electrocution was filmed by Thomas Edison's company. The 74-second film was released January 17, 1903, on coin-operated kinetoscopes owned by Edison. This single incident of actuality exemplifies an issue that haunts documentary: Does the power to record and share things mean that the form always *should*?

Origins of the Term Documentary and Early Works

The origins of the term and the conception of documentary is credited to John Grierson's writing about Robert Flaherty. Flaherty made the film *Nanook of the North* in 1922, which is frequently cited as the start of English-language documentary. *Nanook* was quite successful, and told the story of an Inuk man and his family, who were living in the Canadian Arctic. Since the distinction between documentary and fiction film were not yet widely used, *Nanook* is seen as problematic. It consists of staged recreations of a native lifestyle that had already been abandoned to the past, though they were an important part of Inuk history. Flaherty was interested in sharing what he had learned as a prospector who became familiar with these native populations, and originally shot footage in 1914–1915, though he ended up having to reshoot in 1920–1921 after the initial footage caught fire (legend says Flaherty dropped a cigarette on the camera negative). On the reshoot, Flaherty decided on an approach that was more ethnographic reconstruction than the original travelogue approach.

Building on this success, Flaherty made *Moana* (1926). Shot in Samoa in 1923–1924, Flaherty used the same approach of ethnographic reconstruction to document life, what French and European scholars now call “docu-fiction,” which becomes important to documentary when it comes to filmed or recorded recreations. Flaherty's film *Moana* was reviewed by John Grierson for *The New York Sun*, in which he wrote “Of course, *Moana* being a visual account of events in the daily life of a Polynesian youth and his family, has documentary value.” Grierson was noting how documents have an important and central value to historians, scholars, and lawyers for their value as primary sources that reflect a factual and authentic record. The same applies to journalists, whose

work is fundamentally grounded in fact and authenticity verified through documentation.

Audiences come to understand documentary as viewers build experience with the visual and audio languages the films use, the conventional choices that producers make, the unconventional experiments that they may undertake, and the contexts that give them cultural meaning. Questions of form are also questions of technology, since the machinery used to record actualities, interviews, visual, or audio events, and the treatment of these materials in postproduction play a central role in how the form of documentary is experienced and understood.

Silent era documentaries included several “city symphony” films that portrayed urban life in ways that reflected the connection between film and art. Paul Strand's *Manhatta* (1921) and *Berlin: Symphony of a Great City* (1927) by Walter Ruttmann are two examples, though Dziga Vertov's *Man With a Movie Camera* (1929) is often cited as the greatest documentary ever made. These films featured innovative techniques, experiments in style, and a poetic storytelling voice.

Connections to Persuasion and Propaganda

While documentary was developing as a mode of storytelling, its complex historical link to persuasion and propaganda grew. In the 1920s for example, both documentary pioneer Grierson and John Reith, who was the director-general of the British Broadcasting Company (BBC) when it was chartered in 1927, spent time in the United States learning about the uses of mass persuasion by big business as well as by the U.S. government. Documentary's power as a persuasive form was championed by Grierson, who saw the potential of film manipulation—creative treatment of actuality, in his words—that could express ideas that were possible with the way the world was observed and recorded could be treated or interpreted.

In the middle of the 20th century, with the rise in the use and potential of radio, film, and later television to create documentary, the tension between “creative treatment” and “actuality” became significant. Luis Buñuel's film *Land Without Bread* (1933) remains controversial when discussed as documentary. The film displays Buñuel's influences from both ethnography and

surrealism. The exaggerated narration contrasts with the conditions of misery experienced by the inhabitants of this mountainous region of Spain. It was banned for a period of years after its release. *Triumph of the Will* (1935) is a Nazi propaganda film made by Leni Riefenstahl which presents a document of a 1934 Nazi Party congress.

The controversy over how to think about documentary as a persuasive approach continues to challenge scholars, as is the case with the propaganda films made for the U.S. government by Pare Lorentz during the Roosevelt administration (*The Plow That Broke the Plains* in 1936 and *The River* in 1938) as well as the Frank Capra-directed *Why We Fight* films during World War II (1942–1944). And in the United Kingdom, documentary moved from a persuasive form to depictions of imperial economics, from the years under the Empire Marketing Board in the 1920s and early 1930s, to the General Post Office Film Unit through most of the 1930s, and later to the propaganda work of the Ministry of Information at the outbreak of World War II. A standout film from the pre-war era, *Night Mail* (1936) displayed the nationalistic pride that came from the complex efficiency of the mail delivery system across the United Kingdom. Participants in the film included arts luminaries like W. H. Auden's verse commentary, set to music composed by Benjamin Britten. In terms of the authenticity of the production, *Night Mail* combined actual train footage with material shot on elaborate set constructions intercut together.

Radio and Television Documentary

Radio documentary, a form using edited sound to create nonfiction storytelling, has its origins in the late 1930s. Seen as documentaries produced for entertainment purposes, Allen Funt's original radio program *Candid Microphone* started in June 1947 and can arguably be seen as the origin point for what later became reality television (via Funt's own *Candid Camera*, variably airing between 1948 and 2014). More journalistic work was being done by the CBS Documentary Unit in the late 1940s. The era saw a culture interested in audio programs that combined journalistic authenticity with dramatic storytelling techniques. The expansion of this kind of material was also

enabled by audio recording equipment becoming more portable, allowing for practical ways to gather authentic sound.

In coming to understand journalistic documentary as a historical movement, the work of Edward R. Murrow and his colleagues, which gained prominence through radio journalism during the war, turned into a powerful documentary production unit. Early audio documentary work is highlighted by the phonograph records produced through the collaboration of Murrow and producer Fred Friendly in 1948, released as a series of 78 RPM records in a box set called *I Can Hear It Now 1933–1945*. The records combined sound actualities with narration, and two follow-up albums were released in 1949 and 1950. This led to the development of the radio program *Hear It Now* (1950–1951), a magazine format nonfiction radio program that features pieces of sound actuality, frequently described as hearing history in the making.

Completing the journey from phonograph-based documentary audio to radio-based programming, *Hear It Now* moved to television when the radio program jumped to television, turning into *See It Now*. Working with producer Friendly, Murrow used the news documentary form to investigate political issues. In 1954, it famously documented an investigation into alleged communist infiltration of the U.S. government conducted by U.S. Senator Joseph McCarthy, accusing him of turning the congressional investigation into persecution, and exposing the tactics of accusation that, Murrow argued, tried to turn dissent into disloyalty.

The last of *See It Now* in 1958 was followed by the documentary series *CBS Reports*, which ran from 1959 through the 1990s. The great potential of this form of journalistic documentary can be seen early on in the episode *Harvest of Shame* (1960). Broadcast on the day after Thanksgiving 1960, it documented the experiences of the migrant workers whose living and working conditions were deplorable and exploitive. The program's importance to documentary is partially based on how the program provoked an argument about the relationship between observation and interpretation, since it clearly advocates for political change and increased critical consciousness to argue for change in these working conditions.

Verité and Direct Cinema

The technology of filmmaking went through a dramatic change in the 1950s and 1960s, through the development of lighter and much more portable cameras, crystal-based sync sound equipment that enabled double system recording (visuals and audio on two different machines), better battery systems, and faster film stocks that required less light to produce sufficiently high-quality images. For documentary, these changes led to a wide-ranging change in the possibilities of film production, since the filming and recording could move into the world so much more easily, and the subjects could be followed in action. Other factors are also significant contributors to the implementation of change. The desire for change in the United States was also driven by the TV journalist's stylistic need to get past illustrated narrated lectures; and in France, the desire for change was grounded in the way ethnographic work was incorporating actuality documentary into its discipline.

The film *Primary* (1960) became a critical landmark in the juncture between journalism, documentary, technology, and style. The film was produced by Robert Drew with a collection of documentary makers who were then or later significant to the form: Richard Leacock, Don Pennebaker, Albert Maysles, and his brother David Maysles. The style of the film was made possible by the portable equipment, but it was the style of fluid movement with characters and synchronized sound that made the film stand out. Its portrayal of John F. Kennedy's primary campaign in Wisconsin had a style that captured the energy of the moment.

Interestingly, Drew was motivated by a desire for journalism to capture life in a more authentic way than had been done. Drew criticized Murrow's *See It Now* work as being too much of an illustrated lecture. But he also saw some observational film segments in the program, a couple of pieces by film photographer Bill McClure, that captured a kind of real-life energy that would later become the groundbreaking journalistic documentary style of *Primary*. However, the networks refused to air the documentary, and it ran on four stations owned by Time Inc., Drew's employer at the time.

The style was adopted by other filmmakers as well. Direct cinema was the name applied to the

movement of documentary that took advantage of these technological changes and adopted some version of the style, especially in Canada and the United States. In France, *cinéma vérité*, like direct cinema, aimed to capture sound-synchronized film of life as lived. But where direct cinema was observing (*fly on the wall*) *cinéma vérité* was participating (*fly in the soup*). Filmmakers' work acknowledged the presence of cameras and filmmakers as part of the film, rather than disguising or hiding their presence. The question is, which has a better grasp on observing the world: camera footage that does not involve or directly acknowledge the camera, or camera footage that is admittedly conscious of the role of the camera in the world it observes? Can the camera unobtrusively record the world, or is its very presence transformative? And how does this difference affect the way we think about "truth" in relation to documentary?

The issues of authenticity in documentary were also in play, perhaps as a reaction to the persuasive politics of documentary of the previous decades. Arguably, the new generation of documentary filmmakers could benefit from these improved technologies, but they were also quite aware of the challenges posed by persuasive forms (propaganda or not). Also, in several places, the importance of film as a communication and educational medium led to public sector efforts to be more involved in supporting documentary filmmaking.

Rise of the Filmmaker

The BBC, which became a public service (and publicly funded) broadcast service in 1925, focused on radio developments in television as a primary distribution means for documentary led to the creation of *Special Enquiry*, the BBC's earliest documentary series (1952–1957). The investigative journalism documentary series *Panorama* started in 1953 and remains on the air. While public sector and corporate radio and television had places where documentary flourished, in the world of film production and distribution, a spirit of independent documentary moved forward as its own art form.

In *Night and Fog* (1956), Alain Resnais combined graphic archival and (then) contemporary footage of victims of the Holocaust to consider

the meaning of Nazi concentration camps, and the question of responsibility. Frederick Wiseman made his films using a direct cinema approach to examine a variety of institutions, often provoking controversy when the observed depiction reflected poorly on an institution; *Titicut Follies* (1967) recorded the way an institution's staff treated patients or inmates with mental problems; *High School* (1968) showed how faculty and staff work to reproduce mainstream values in high school students in ways that are simultaneously demeaning, comical, and problematic. Errol Morris is best known for his film *The Thin Blue Line* (1988), which argued that a man on death row was actually innocent of the murder for which he was convicted. Morris played with the relationship between how people tell their stories and the way one can document truths and lies.

Women and Documentary

The conditions that have privileged the voices of white males in communication forms carry into documentary as well. However, often documentary has become a way for women to enter filmmaking.

Alice Guy, later known as Alice Guy Blanche, was a French film industry pioneer in both nonfiction and fictional film. The catalog of the company she ran (she was a pioneer film company owner as well as a filmmaker) lists several actuality shorts produced in 1906–1907. Early Russian filmmakers included Esfir Shub, who directed the first “found footage” documentary, *The Fall of the Romanov Dynasty* (1927), and Yelizaveta Svilova, who worked with her partner Dziga Vertov on *Man With a Movie Camera*, and also made post-War World II documentaries *The Fall of Berlin* (1945) and *Nuremberg Trials* (1946).

In the 1930s, Mary Field worked with F. Percy Smith on a pioneering wildlife series called *Secrets of Nature*, which began in 1922. In that series, Field directed *The World in a Wineglass* in 1931. She was involved in early educational film production, as well as natural history filmmaking. She directed *The Mystery of Marriage* (1932), a nature documentary about gender roles, and *They Made the Land* (1938) about Scottish land reclamation. She also supervised the series *The Secrets of Life* (1934–1950).

Agnès Varda had worked with *Night and Fog* director Alain Resnais on a fictional film of hers,

but that was soon followed by documentary work like her 16-minute film *L'opéra-mouffe* (1958), which was released in the United States under the title *Diary of a Pregnant Woman*. Varda's later documentary work included participation in the multisection documentary *Far From Vietnam* (1967) with fellow documentary makers Resnais, Chris Marker, and Joris Ivens; *Mur Murs* (1981) about the murals in Los Angeles; and *The Gleaners and I* (2000). Her style has traces of experimentalism reflective of the French New Wave film movement.

Many contemporary women documentary makers present complex pictures of culture and politics. In 1954, Nancy Hamilton made *Hellen Keller in Her Story*, and became the first woman to win the Academy Award for Best Documentary Feature in 1955. The second was Sara Kernochan, who codirected the 1972 documentary *Marjoe*. A significant documentary directed by singer Judy Collins and Jill Godmilow in 1974, *Antonia: A Portrait of the Woman*, was nominated for Best Documentary Feature.

One of the most important women documentary makers is Barbara Kopple. Using many of the cinema verité traditions, Kopple's work brings to life parts of American culture that bring unique perspectives to the viewer, like her documentary about striking coal miners, *Harlan County USA* (1976), and her many documentaries about artists, such as her portrait of the musical group The Dixie Chicks and their controversial comments in *Shut Up and Sing* (2006), or the portrait of a singer struggling against many kinds of marginalization in *Miss Sharon Jones!* (2015).

Some of the greatest insights into the world of women and documentary comes through the film *Cameraperson* (2016). Kirsten Johnson uses footage she has shot over her career as a documentary cinematographer to explore the power of images and the ethics of documentary filmmaking. In the recent past, she has been working with Laura Poitras, who makes documentaries that construct complex investigations into abuses of power and corporate excess, including the Emmy-nominated film *Flag Wars* (2003), about gentrification in Ohio, and *Citizenfour* (2014), about Edward Snowden, which won the 2014 Academy Award for Best Documentary Feature. In a 2019 interview for *IndieWire*, Poitras identified the significance of documentary in an environment where

journalism may not be enough to shed light on the darkness: “I think documentaries do a lot of the investigating that the ecosystem for newspapers has been able to support. So many newspapers are closing and documentaries have been able to do essential work in terms of holding power to account, creating critical analysis of the historical moment while having a lasting impact. It’s not just about a 24-hour news cycle” (Kohn, 2019).

LGBTQI+ and Documentary

Documentarians from the LGBTQI+ community have also been active in documentary production and represent a growing movement. The Jack Smith film *Flaming Creatures* (1963), which bridges experimental and documentary, was championed by experimental film pioneer Jonas Mekas, but was seized by the New York Police Department on obscenity charges, due to its frank depiction of gay culture and sexuality. The history of lesbian and gay documentary witnessed a growing interest in alternative documentary making that comes to light in the later 1970s, with Arthur Bressan Jr.’s *Gay USA* (1977), about the gay rights movement, and the film produced by the Mariposa Film Group, *Word Is Out: Stories of Some of Our Lives* (1977). In 1985, *The Times of Harvey Milk* (1984) directed by Rob Epstein won the Academy Award for Best Documentary Feature.

Documentaries from and about the LGBTQI+ community have experienced significant growth since 1985, as queer community political movements redefined identity and politics in relation to public spaces, community, and the nation. Because the situations and subjects that these works sought to document and (re)imagine are fluid, at risk, and in flux, most of them mix documentary modes. This mix of modes included an examination of the constructed ways of representation found in (auto)biography, ethnography, and the way audiences acclimate to these reflexive modes of discourse.

A bridge between queer cinema and documentarians of color can be found in the work of Marlon Riggs. His examination of caricatures of Black people in *Ethnic Notions* (1986) uses documentary to raise the question of representation as a set of social practices, against an argument about what the hypothetical effect of such images might be. As has been the case throughout the history of

documentary, questions of the mode of speaking, as well as the authority to speak, are fundamentally complex. Riggs’s 1989 experimental documentary *Tongues Untied* can be viewed as an interrogation of the ability of documentary to move through a world full of different media, offering startling observations about how the role of the author—the notion of authority—raises questions about the roles of objectivity and subjectivity, since its depiction of Black gay life is both personal and performed for the camera.

African Americans and Documentary

The significance of African American documentary filmmaking reaches back to the silent era, though surviving material underscores the marginalized position of such work. Most of the knowledge historians of documentary have been able to assemble about early African American documentary comes through diary entries, newspaper accounts, and similar kinds of sources. For example, information about a 1909 film called *A Trip To Tuskegee*, made by George Broome working in conjunction with Booker T. Washington, is compiled from such sources. The film depicted exteriors of the Tuskegee Institute, footage of Washington, and scenes of students involved in road construction and agricultural work, as a way of presenting the work of the institute. The screenings of this film in New York City contributed to the debate between Washington’s camp, who sought a kind of gradual improvement in the lives of Blacks through industrial education programs, and those aligning with W. E. B. Du Bois, who sought a kind of education aspiring toward leadership, which came through a liberal arts education steeped in literature, the arts, and intellectual development.

Many of the African American documentaries that have been lost were reported to focus on Black soldiering in both World Wars. Carlton Moss was involved as the script writer for *The Negro Soldier* in 1944 (with a directing credit to Frank Capra). Moss followed this with another film on Black soldiers (*Teamwork*, 1946), but turned his producing work to films documenting the role of Black arts and cultural innovation through the 1970s, and then becoming a teacher of film production. The newsreel work of William Alexander, and the pioneering television work of

William Greaves, such as the public television program *Black Journal* (1968–1977) contributed to a legacy of African American documentary. Greaves went on to make the cinema verité-styled *Emergency Ward* (1959) while he spent time working in Canada's National Film Board. He was commissioned by the U.S. Information Agency to make *Wealth of a Nation* in 1964, which discussed freedom of speech and expression in art among African Americans, and *From These Roots* (1974), about the Harlem Renaissance.

In addition to the important work of Marlon Riggs, there were a small number of documentaries by Black directors in the 1980s and 1990s, but after 2000 the number of films becomes much more significant. In 2010, Roger Ross Williams was the cowinner of the Best Documentary, Short Subjects Academy Award for *Music By Prudence* about Zimbabwean vocalist Prudence Mabhena.

The documentary series *Eyes on the Prize* was a landmark 14-part series depicting the history of the American civil rights movement. It was produced in two sets of episodes that ran on PBS in 1987 and 1990. The sixth episode of the first set, "Bridge to Freedom" (1965), was codirected by Callie Crossley and James DeVinney. In 1988, Crossley became the first Black director to receive an Academy Award nomination. This series used a combination of extensive, deeply researched archival footage combined with contemporary witness interviews to tell the story of civil rights. Other significant Black documentary directors who received Academy Awards include T. J. Martin (*Undeclared*, 2011), and Ezra Edelman (*O. J.: Made in America*, 2016). While *Undeclared* benefited from Hollywood financing and producer participation from rapper and record producer Sean Combs, *O.J.: Made in America* was produced through ESPN Films.

Documentary Exhibition and Distribution

Issues of financing and distribution have been a challenge throughout the history of documentary. Since the shift from film to video, and with the advance of the quality and light sensitivity of cameras, microphones, and lenses, independent documentaries have benefited from lower costs,

especially since the introduction of the Canon 5D Mark II in 2008. Small DSLR cameras were combined with reasonably cheap and powerful editing software like Avid, Final Cut, and Premiere, to make documentary production tools available to a much larger number of filmmakers.

But it is perhaps in distribution and exhibition that documentary's role in culture has experienced the most change. Seeing a documentary in a theatrical setting goes back to the silent film days. Radio documentary became notable in the 1950s, at the same time that television became a significant way for people to see documentaries. Commercial television network documentaries were typically produced through news divisions, and maintained a journalistic style, perhaps most clearly seen in the new magazine format of *60 Minutes*, which first aired in 1968. At the same time, the public television system offered several series for both journalistic and independent documentaries. The *Frontline* investigative journalism series has been airing since 1983, while the series *POV* began airing independently produced documentaries in 1988, and *Independent Lens* has been on PBS since 1999.

A further expansion of television outlets came with the growth of cable television services, which greatly expanded the amount of visual programming available to American households. Documentary benefited from this expansion, perhaps most notably with the expansion into documentary of Home Box Office, commonly known as HBO. The company started as a channel that programmed theatrical fiction films in 1972, but as it grew it expanded into documentary in 1979, most notably with the series *Time Was*, hosted by Dick Cavett, which offered an archival footage-based portrait of decades starting with the 1920s. The HBO documentary series *America Undercover* started airing in 1983, under the supervision of Sheila Nevins. Since it was a pay TV service, and outside the normal standards and practices of the networks, many of the documentary subjects were the kind that would never appear on broadcast television, and only rarely on the public TV airwaves. HBO offered a combination of hard-hitting investigative documentaries, depictions of crime and sex, and films that represented significant nonfiction storytelling.

Documentary in Digital Space

A new era of distribution and access to documentary has developed with the Internet. Podcasting is a rapidly growing arena for the development of a wide variety of documentary storytelling, most visibly exemplified by the significant success of the series *Serial*, which first aired in 2014. Major non-fiction podcast genres include true crime, history, art and music documentaries, and explorations of technology and culture.

Increasing Internet speeds and wide access mean that visual documentary can take advantage of open access to free platforms like YouTube, Vimeo, SnagFilms, Documentary Wire, and the public domain and creative commons repositories in the Internet Archive, especially the Prelinger Archive. Traditional organizations like PBS also offers many documentaries online for free viewing, while pay-to-view services include the Documentary Channel, Netflix, iTunes, and Amazon. Public libraries have also moved from offering documentary titles on tape or disc that can be borrowed to shared library streaming services like Kanopy and Hoopla. With the continuing expansion and competition of streaming services, documentaries have enjoyed a significant increase in audience since the days of limited theatrical screenings and “appointment” network television.

As the reorganization of documentary as intellectual property continues, the opportunities to watch may well outstrip the time people have to pay attention. For the sake of a deeper cultural literacy about documentary, perhaps it would be worthwhile to hope that its history will not be lost, and that the conventions documentary has established and continues to explore will lead to a wider variety of documentary voices and a deeper audience understanding of how documentary works.

DOUGLASS, FREDERICK

One of the most prolific and well-respected political journalists in U.S. history, Frederick Douglass was an African American writer and orator who helped lead the fight for abolition in the United States during the 19th century. He was enslaved for 12 years before escaping in 1838, after which he founded and edited several newspapers, becoming highly influential and developing ties with political leaders, including President Abraham Lincoln. This entry chronicles Douglass's early life, then discusses the start of his journalism career and the founding of his first newspaper, *The North Star*, which covered the abolition movement in the United States and related international events. It then discusses the newspapers he subsequently founded or took over and his work with Ida B. Wells-Barnett.

Early Life

Given the birth name of Frederick Augustus Washington Bailey, Douglass was born into slavery in Talbot County, Maryland, along Tuckahoe

Creek in 1818. Douglass's birthday is not known, but he would fix it as February 14. Douglass, who would change his name after escaping from slavery, was separated from his mother, Harriett Bailey, in infancy. Douglass would live with his enslaved maternal grandmother, Betsy Bailey, and free grandfather, Isaac. In general, he knew very little about his parents, and he noted in *My Bondage and My Freedom*, "Genealogical trees do not flourish among slaves" (as quoted in Blight, 2018, p. 28).

Young Douglass would be forced away from his grandparents by the time he was 6 years old. While a youngster, he witnessed the brutal lashing of his aunt Hester by Aaron Anthony. Two years later, he was moved to the Fells Point neighborhood of Baltimore, Maryland, where he grew up with the Hugh Auld family (brother of his master, Thomas Auld) and worked on loan as a house servant whose main responsibility was being a companion to the Auld's young son. The mother, Sophia Auld, began to teach Douglass how to read and write (Douglass had expressed curiosity after hearing Sophia read aloud from the Book of Job from the Bible), but her husband, Hugh Auld, forbade the teaching of a slave, fearing Douglass would learn to crave his liberty and would then want to escape. Auld told his wife that literacy obtained from the Bible would make slaves "disconsolate and unhappy," thus spreading disaffection (Dilbeck, 2018, p. 23). The talk that Auld gave to his wife about advancing Black literacy stayed with Douglass for the remainder of his life.

Accordingly, Sophia Auld backed off on teaching Douglass, but he kept reading secretly. This included a strong appetite for reading any newspaper upon which he could lay his hands, as well as *The Columbian Orator* by Caleb Bingham—a collection of poems, essays, and dialogues used in schoolhouses in the first half of the 19th century. Later, working on the William Freeland farm, Douglass would teach other enslaved people how to read, using the New Testament and *The Columbian Orator* as his text. His first great cause, then, was spreading literacy among his fellow slaves. Douglass would later credit these days teaching his fellow slaves how to read and write as the beginning of his oratory career.

While in Baltimore, Douglass heard a Methodist preacher. This, along with his meeting a lay preacher named Charles Johnson and coming

under the spell of Bethel AME Church member Charles Lawson, spurred him into a conversion to Christianity. Lawson continually advised Douglass that he would find his freedom from slavery through God and that he would become a servant of some sort who would be “a useful man” (Dilbeck, 2018, p. 30). In 1834, Auld rented out Douglass to work on the farm of Edward Covey. While serving under Covey, Douglass faced severe lashings. According to historian David W. Blight, the time on Covey’s farm represented a transformative experience for Douglass (2018, p. 60):

Covey’s savagery is forever cloaked in some of his [Douglass’s] most beguiling and lyrical prose . . . Douglass’s great gift, and the reason we know of him today, is that he found ways to convert the scars Covey left on his body into words that might change the world.

Start of Journalism Career

After returning to work for Auld in Baltimore, at the age of 17, Douglass met his future wife Anna Murray, a free Black woman. In September 1838, Douglass escaped to freedom in Philadelphia and eventually moved to New Bedford, Massachusetts, a sanctuary for former slaves. His name change to Douglass was primarily a way to keep bounty hunters off his trail. In New Bedford, he began subscribing to William Lloyd Garrison’s *The Liberator*, an abolitionist newspaper. The newspaper argued against slavery on moral grounds, and Garrison focused on persuasion via the press rather than political or even violent means to upend the slavery order in the United States. This influence was critical for Douglass, who had seen firsthand how violent slave masters could be. The idea that the campaign to end slavery would be as much about communication as anything else was decisive. Words would be the means for converting those who did not see the truth about slavery.

On August 11, 1841, he spoke at an antislavery conference in Nantucket about his time as a slave. His life was his text, and while he was nervous speaking in front of a large gathering, his words had a strong effect on the audience. Garrison and Wendell Phillips were among the notables in the crowd that evening. After Douglass spoke, Garrison was up next, and he asked the crowd if a man

who had lived the life Douglass had lived should be allowed to be taken away from Massachusetts and back into slavery. The answer from the assembled was an emphatic no. That first public speech was so compelling that it led to Douglass’s appointment as an agent for the Massachusetts Anti-Slavery Society, and he became a regular speaker in opposition to slavery. Accordingly, Douglass quit his Bedford job, moved his family to Lynn, Massachusetts, and became a full-time communicator for emancipation. For the rest of his life, he would make money off words, both spoken and printed.

Douglass began his journalism career writing letters that Garrison published in *The Liberator* and then in 1845 published his autobiography, *Narrative of the Life of Frederick Douglass, Written by Himself*. It was based on his stump speech and sold more than 30,000 copies in the United States and Great Britain in the 5 years after publication. *Narrative* was translated into French, German, and Dutch. The success of *Narrative* and Douglass’s increased prominence put him at greater risk he would be captured and returned to his Maryland master. Garrison and Douglass also frequently face other forms of hostility, including the throwing of vegetables and other missiles at them during their speech-making. Douglass also faced more violent acts against him, including an assault in Indiana that left him with a broken hand that never fully healed.

Garrison and others suggested that Douglass take a tour of Great Britain to let things cool down. During a 19-month tour, Douglass earned money speaking to abolitionist organizations in England, Ireland, and Scotland. There even was an attempt to raise money to pay off his master and win his complete freedom. Garrison opposed such a gambit because it, in his mind, legitimized slavery and essentially was an accommodating position not in keeping with abolitionist strategy.

Douglass also wrote a regular column for the *National Anti-Slavery Standard* newspaper and was a regular in *The Ram’s Horn*. In his first piece in the *Standard*, he looked back on the emancipation of the slaves in the West Indies after the British officially ended slavery in its empire in 1838, and the freeing of the Caribbean slaves gave hope that one day slaves in the United States would “rejoice over the downfall of slavery in our own land” (*Standard*, 1847). In another letter for the

Standard, he wrote about how while audiences were quite receptive to the content of his tour speeches, restaurants and churches would not admit him. Similarly, steamboats would simply serve no food if he or another free Black person was on board. Douglass was briefly an editor for *The Ram's Horn*, along with Thomas Van Rensselaer.

The North Star

Douglass started his own newspaper, *The North Star*, in December 1847, after the speaking tour in Great Britain and the short stint writing for the *Standard*. The tour raised \$2,175 for Douglass, but also for a printing press, and he decided to start his own newspaper back in the United States. During his stay in Britain, he went on the offensive against churches there that took donations from the Southern Christians who owned slaves, stating that slavery was incompatible with Christianity.

Garrison was not happy about Douglass deciding to make his own newspaper, and the two grew apart. Douglass, who had relocated to Rochester, New York, hired Martin Delany to be the co-editor of *The North Star*. A second hire was William Cooper Nell to serve as publisher, and a third was Scotsman John Dick to serve as printer. Dick was in charge of the day-to-day operations of the newspaper and also wrote articles.

At first, Douglass published *The North Star* from the basement of Rochester's Memorial AME Zion Church and later moved it to the Talman Building at 25 Buffalo Street (there also was an antislavery reading room in the building). At the same time, he and his wife Martha also participated in the Underground Railroad, providing lodging and provisions for hundreds of escaping slaves. The newspaper was a four-page weekly with seven columns of type across each page. *The North Star* had an annual subscription rate of \$2 if paid in advance and \$2.50 if paid 6 months after opening a subscription. Douglass emphasized that *The North Star* would be attached to no political party and that he would be completely independent of thought. He would advocate for enslaved people and for the end of slavery.

The front page usually consisted of current events involving the abolitionist movement, news

about fugitive slaves, or news from other states (one such touted Georgia for focusing on progress by increasing its population and building a vast rail network, while South Carolina only increased its slave population and developed its own military). The second page, as was common in the middle of the 19th century, featured Douglass's editorials as well as clipped articles from other newspapers, including *The Liberator* and *The National Era*, an abolitionist journal published in Washington, DC. The newspaper also printed a list of recent subscribers on the third page. Douglass wrote that *The North Star* was "a journal devoted to the cause of liberty and progress" and to "impress my sable brothers in this country with the conviction that . . . progress is yet possible, and bright skies shall yet shine upon their pathway" (Douglass, 1987, pp. 247–248). The newspaper's motto was "RIGHT IS OF NO SEX—TRUTH IS OF NO COLOR—GOD IS THE FATHER OF US ALL, AND ALL WE ARE BRETHERN" (*North Star*, 1848).

The split with Garrison also came over doctrine. Douglass changed his view on whether the U.S. Constitution was a pro-slavery document. Listening to arguments by abolitionist and Liberty Party presidential candidate Gerrit Smith, Douglass came to see that the Constitution could be seen as potentially antislavery, especially in its preamble where both justice and liberty were emphasized for all of its citizens and future generations of Americans. For Douglass, the Constitution was similar to the Bible, which he also read as inherently antislavery, at least in what might be called the *spirit of the text* (Dilbeck, 2018, p. 79).

Douglass chose to pay attention to events beyond the shores of the United States and was proud of the international scope of *The North Star*. The start-up funding had come from British supporters, so he also might have felt an obligation to make the newspaper more international in scope than most American journals. In its first year, half of the more than 400 subscribers of *The North Star* were British. There also had been a tradition of circulating Black newspapers published in the United States beyond its borders, particularly to the Caribbean and Europe.

One key set of events in the early days of *The North Star* was the revolutionary fervor in Europe in 1848. Douglass seized on the revolutions there,

especially the one in France where the provisional government stated its intent to abolish slavery in its colonies. He hoped the French government's statement would shame the United States into ending slavery. Look to Europe, he wrote, to see how freedom should be. Globally, Douglass saw freedom as a response to oppression, and opinion abroad would ultimately make change inevitable domestically. Douglass was able to cover more current international news because of two technologies: the telegraph and the steamship. The latter would roar across the Atlantic, and then telegraph operators in Boston and New York would push the news of the revolutions along the lines east and west, north, and south.

On the 10th anniversary of his escape from slavery, the journalist published an open letter to his master, Thomas Auld. Titled "To My Old Man" and running on the second page of *The North Star*, the letter says that Douglass had long been troubled as a youth about why he was a slave and how a just God could permit slavery. "When I saw the slave-driver whip a slave woman," he wrote, "cut the blood out of her neck, and heard her piteous cries, I went away to the corner of the fence, wept and pondered over this mystery." Then Douglass tells Auld that both men are made by God, adding "we are distinct persons, equal persons . . . I am not by nature bound to you, or you to me." He criticizes Auld for keeping his kin ignorant and illiterate. Douglass then asks Auld how he would feel if Douglass kidnapped Auld's daughter Amanda, to proclaim her property, make her work without wages, "feed her coarsely—clothe her scantily, and whip her on the back occasionally" (*North Star*, 1848). The main intents of the letter included rallying Northern free Blacks to read his newspaper, letting Southerners know that what was then referred to as their peculiar institution had no moral ground on which to rest, and to send a scathing message to Auld.

Frederick Douglass' Paper and Douglass' Monthly

Smith and Douglass continued their close association and would combine forces to create *Frederick Douglass' Paper* in 1851. Also published from the Talman Building in Rochester, it spanned seven columns and was published weekly. The first

column on the first page was devoted to news. One column would be titled "Anti-Slavery Movement" and featured stories about abolition on both sides of the Atlantic. Sometimes, Douglass put his own pieces on the front page, such as his "The Heroic Slave" on March 18, 1853. In that same edition, on the second page, Douglass published an article titled "The Black Law of Illinois," condemning the state for prohibiting entry into the state of any Black person for the purpose of settling there and providing extradition of any fugitive slaves. He wrote: "What kind of people are the people of Illinois? Were they born and nursed of women as other people are? Or are they the offspring of wolves and tigers, and only taught to prey upon all flesh pleasing to their bloody taste?" (*Frederick Douglass' Paper*, 1853).

In 1858, Douglass began his third publication, *Douglass' Monthly*, while he was on tour in the Midwest. James McCune Smith edited the *Monthly*, which had problems with staying afloat financially, despite Douglass's consistent appeals to his British supporters. One approach Douglass had to the *Monthly* was constantly plying the British readers with positive news about slaves escaping to freedom. The 16-page newspaper would only last 5 years, but it is a crucial piece of the Douglass archives in that it shows his intellect and journalistic acumen during the Civil War. The newspaper documents how Douglass rejected the idea that once freed from slavery, Black people should go to live in colonies in Africa. He jubilantly reported of contrabands flowing into Illinois in the days leading up to the Emancipation Proclamation taking effect on January 1, 1863. He praised President Abraham Lincoln's proclamation as a "moral bombshell," and yet would hold Lincoln's feet to the fire over equal pay for Black Union soldiers and sailors, as well as not giving free Black men the right to vote.

New National Era and Work With Ida B. Wells-Barnett

Douglass would end the monthly newspaper because he had been asked by the Lincoln administration to tour the conquered portions of the South and recruit ex-slaves to join the Union cause. However, Douglass complained that he never received a commission and thus decided not

to tour. After the war and Lincoln's assassination, his last newspaper would be the weekly *New National Era* (formerly Gamaliel Bailey's *National Era*), which Douglass ran from 1870 to 1872. It supported Ulysses S. Grant for president and focused on fighting the political backsliding and violence against Black people in the South during Reconstruction.

Douglass spent much of the last three decades of his life, prior to his death in 1895, as a public speaker rather than a journalist. Late in life, however he supported the work of another trailblazing Black journalist, Ida B. Wells-Barnett. Wells-Barnett used her newspaper, the *Memphis Free Speech*, as an advocacy tool to combat racism and especially lynchings in the South. Douglass wrote the introduction to Wells-Barnett's 1893 book *The Reason Why the Colored American Is Not in the World's Columbian Exposition*. In it, Douglass said he wished he could tell non-Americans that Americans had made strides in morality to match their material gains, but that he could not. Douglass also wrote the introduction to Wells-Barnett's book *The Red Record*, published in 1895, calling lynching an abomination.

DOW JONES

Dow Jones & Co. is a New York-based media company that operates business news organizations *The Wall Street Journal*, *Barron's*, *MarketWatch*, *Mansion Global*, *Financial News*, and the Dow Jones Newswire. The company also sells news and information to corporations through businesses such as Factiva, VentureSource, and Risk & Compliance. *The Wall Street Journal*, the largest and most influential operation within the company, has become the largest U.S. newspaper in terms of paid print and digital circulation, according to the Alliance for Audited Media, and as of 2020 had won 37 Pulitzer Prizes during its 130-year history. The newspaper also operates 12 different websites around the world in six different languages. The company, which was acquired by News Corp. in 2007, is also well known for creating the first well-known stock market index. This entry provides an overview and history of Dow Jones & Co., from its founding in New York in the late 19th century to its acquisition by News Corp. It concludes with an assessment of its current operations and the challenges it faces.

The founders of the company—Charles Dow, Edward Jones, and Charles Bergstresser—worked together at the Kiernan News Agency. They left there to begin a wire service—the precursor to the Dow Jones Newswire—in 1882 that delivered news to investment companies in the Wall Street area of New York. Bergstresser was the main financial backer of the new company. A year later, they began publishing a business newspaper called *Customers' Afternoon Letter* and in 1884 published its first stock average of nine railroad companies and two industrial companies. The first office was at 15 Wall Street, next door to the New York Stock Exchange and in the same building as their former employer.

The newspaper was renamed *The Wall Street Journal* in July 1889, taking the name of another publication that had closed, and the first issue included a chart on the front page showing the average movement of stock prices. Subscribers paid \$5 a year for the newspaper, or 2 cents for one issue. In 1896, *The Journal* published the first industrial stock average of 12 stocks, including

General Electric Co. and American Tobacco Co. The list was expanded to 20 stocks in 1916 and 30 stocks—where it remained as of early 2020—in 1928.

Clarence Barron's Purchase

Dow started writing a front-page column called *Review and Outlook* in 1899 that assessed market performance. Jones sold his interest in the company during that year, and Dow died in 1902. Bergstresser retired in 1903. The newspaper and its ticker operations were sold to its Boston correspondent, Charles Barron, who combined it with the wire service operation he ran in his hometown. Barron also owned a Philadelphia newspaper called the *Financial Journal*. Combined, the newspapers grew from a circulation of 7,000 to 18,750 in 1920 and to 52,000 in 1928 shortly before Barron's death. He added correspondents in every major American city, and *The Journal* printed morning and afternoon editions. In 1921, he also launched the weekly publication *Barron's*. In a foreword Barron wrote in the May 9, 1921 edition, he said the new publication was devoted to providing information "on which the thoughtful investor may plan to get a purchase with this dollar level in a worth-while effort to budge the world of wealth."

The October 1929 stock market crash that began the Great Depression hurt Dow Jones & Co., as the newspaper and wire service were pro-business and pro-Wall Street. Its slogan since 1903 had been "The newspaper for the investor." In addition, an investigation disclosed that some of its reporters had accepted money before the crash to promote specific stocks in the newspaper. The Dow Jones stock ticker provided jokes in the following years to compensate for the lack of news affecting stocks during the early 1930s. The Barron's family considered closing the paper because of its losses during the Depression.

The Journal and Dow Jones were saved by Barney Kilgore, a journalist who joined the company shortly before the crash. His reporting gained recognition because he compared the earnings banks reported in press releases to what was reported in audited statements and noticed discrepancies. In 1935, he was assigned to run the Washington

bureau and developed "The Washington Wire" feature on the front page. By 1941, he returned to New York as managing editor, and his plan to make the paper the first delivered across the country was accepted by Barron's descendants.

Kilgore broadened the paper's content to include general news, and he changed the business news content to show how it affected readers. He successfully argued that business news affected everyone's life, and that consumers in Portland, Maine, were interested in the same news as consumers in Portland, Oregon. When the Japanese bombed Pearl Harbor on December 7, 1941, *The Journal's* front-page story the next day began with "War with Japan means industrial revolution in the United States." Details of the attack were relegated to the "What's News" column as Kilgore reasoned that its readers would already know what had happened.

WSJ Rises Under Kilgore

Kilgore was named general manager of Dow Jones during World War II and later became president and general manager of the company. When he died in 1967, the newspaper's circulation had grown to more than 1.1 million, up from 41,000 when he took over in 1941. And the company's profit topped \$13 million, up from \$200,000 in 1941. *The Journal* started a Southwest edition in 1948 and added a Washington edition in 1955. In 1951, Dow Jones purchased the Chicago-based *Journal of Commerce* and turned it into the newspaper's Midwest edition. The newspaper dropped its Saturday edition in 1953 after the New York Stock Exchange stopped weekend trading but did not suffer a decline in circulation. Kilgore's lone failure was *The National Observer*, a weekly newspaper that the company started in 1962 but closed in 1977 because of a lack of advertising.

The Journal introduced many innovations to journalism under Kilgore's leadership. Its front page started including feature stories known as an A-hed for the shape of the headline. These stories might have little or nothing to do with business news, but they drew readers into the paper by providing a unique focus. On each side of the A-hed were longer, analytical stories that explained

the significance of breaking news. Kilgore reasoned that the newspaper's readers would already know about the news and would look to *The Journal* to explain how it impacted them. The front page also contained regular briefs columns about specific topics. On Tuesdays, it was news briefs about labor and the workplace. On Wednesdays, it was tax news. On Fridays, it was "The Washington Wire."

In addition, *The Journal* gained a reputation for harder-hitting journalism. In 1954, for example, it ran stories about plans for new models at General Motors, which caused the automaker to withdraw advertising from the paper because it felt the news hurt sales of existing cars. *The Journal* refused to back down from its exclusives. Its 1953 reporting also caused the resignation of one company's management after it purchased another company from Howard Hughes. *The Journal* reporters exposed connections between management and the Mafia.

The company sold stock to the public in the early 1970s, but Barron's descendants maintained a controlling interest in the company. Business journalism expanded in the 1970s due to a recession and the Arab oil embargo, and other daily newspapers began adding business news sections to their publications, with *The New York Times* starting a business news section in 1978. *Investor's Business Daily* began in 1984, and the *Financial Times*, a British newspaper, began circulating in the United States.

1980s Expansion

To address the competition, Dow Jones expanded *The Journal* into two sections in 1980 with the addition of "Marketplace" and added a third section called *Money & Investing* in 1988. It also began expanding internationally, with *The Asian Wall Street Journal* starting in 1976 and a European edition rolling out in 1983. The company also expanded in other ways, adding a chain of small newspapers, a book publisher, and a joint venture with the Associated Press to transmit business and economics news in other countries. The print international editions folded in 2017, although the company has websites that cater to those markets.

Dow Jones faced its biggest credibility issue since the 1929 market crash in 1985 when one of

its reporters, R. Foster Winans, was arrested and convicted of securities fraud for tipping off traders to what he was writing in the "Heard on the Street" column a day before it was published. In 1991, Paul Steiger became managing editor of *The Journal*, and he led the paper through one of its strongest periods as it won 16 Pulitzer Prizes during his 16-year tenure. The paper unveiled its website in 1996, becoming one of the first newspapers to charge for its content online.

The company expanded its financial data operations in the 1980s by investing in Telerate Inc. Dow Jones CEO Warren Phillips saw financial data as a strategy to compete more effectively with rival Reuters. It upped its ownership to 56% of Telerate in 1987 and 67% in 1988. Dow Jones acquired the remaining portion of Telerate in 1990. The acquisition of Telerate, however, proved to be a bad deal for Dow Jones & Co. after Bloomberg LP began offering its financial data services. In 1998, the company sold Telerate to Bridge Information Services, recording a loss of \$1 billion.

Other acquisitions proved more successful. In 2004, Dow Jones acquired CBS MarketWatch Inc. for \$520 million, boosting its revenue from online advertising. Now called *MarketWatch*, the site has more than 30 million monthly page views. And Dow Jones continued to expand its largest business, *The Journal*, by adding a Saturday edition in 2005. The company also struck a deal with CNBC where its journalists began appearing on the business news channel, expanding its brand name recognition.

Acquisition by News Corp.

Dow Jones & Co. was acquired by Rupert Murdoch's News Corp. in 2007 for \$5 billion. The descendants of Clarence Barron, the Bancroft family, had become disappointed with the financial performance of the company, although none of them had been involved in the running of Dow Jones. (The company had historically been run by a journalist who had worked at *The Journal* until Richard Zannino took over as CEO in 2006. Zannino had previously worked at Liz Claiborne and Saks Fifth Avenue before joining Dow Jones as chief financial officer in 2001.)

Murdoch offered a 76% premium to what Dow Jones' stock had been trading, convincing

various Bancroft family members who owned stock to sell. Many Dow Jones employees, including *The Journal* reporters and editors, actively resisted the deal, fearing that Murdoch's ownership would damage the paper's reputation. As part of the deal, a five-person special committee was created. It is an independent body charged with safeguarding the editorial independence of *The Journal* and Dow Jones as well as monitoring their adherence to high ethical and professional standards. *The Journal's* editorial page remains staunchly conservative and continues to portray events in a way that runs counter to what the newspaper's newsroom is reporting, but that dichotomy existed long before Murdoch's acquisition. Murdoch did push the paper to launch a new section of New York-based news to compete with *The New York Times*, but that section was reduced in 2016.

Soon after the deal closed, Murdoch replaced the editor of *The Journal* with his handpicked person, Robert Thomson, and Thomson later became the chief executive officer of Dow Jones parent News Corp. Matthew Murray, a longtime company employee who started at *The Journal* long before Murdoch's acquisition, became editor in chief in 2018. He took over a newsroom disgruntled about former editor Gerard Baker's stance toward President Donald Trump and his aloof management style, which caused some reporters and editors to leave for other media organizations. Murray has encouraged *The Journal's* expansion into more digital products and more aggressive journalism. By 2019, nearly 70%, or 1.8 million, of *The Journal's* subscribers were online only. Overall, Dow Jones surpassed 3 million subscribers in 2018.

The company has also explored new delivery formats and new consumer markets. It has launched Wall Street Journal Pro, which targets business professionals in specific fields such as accounting, bankruptcy, and artificial intelligence. In 2019, it struck a deal with Apple to provide news stories on Apple News. Its content is also on Facebook's news page as well as being available through Bloomberg LP's terminals, a system that provides financial market data and news on markets, economies, and businesses.

The company has narrowed its editorial focus, closing The Wall Street Journal Radio Network in

2014. That same year, it also closed its operation that provided personal finance content to daily newspapers across the country for its Sunday editions. In 2010, it sold a 90% stake in its index business to the parent company of the Chicago Mercantile Exchange for \$607.5 million. In 2012, it stopped publishing personal finance magazine *SmartMoney*, merging its content into MarketWatch.

Dow Jones has separated its non-*The Journal* publications—*Barron's*, MarketWatch, Mansion Global, and *Financial News*—into a separate operating unit called *Barron's Group*. *Financial News* operates in London, while Mansion Global, which started in 2015, covers upscale real estate news. *Barron's* has expanded into China, while MarketWatch has an irregular print publication. The company has also expanded its video content and in 2019 partnered with PBS show "Frontline" on a documentary. In 2018, Baker began hosting a regular show called *WSJ at Large with Gerry Baker* on Fox Business Network, which is also owned by Murdoch.

Although Dow Jones lost its battle with Reuters and Bloomberg in the financial data market, it remains a major competitor in the business journalism field, and *The Journal* is still considered the premier business news publication. It has focused on becoming a digital-first news organization, slowly moving away from its legacy print publications. In 2019, more than 50% of the company's revenue came from digital. The company is also looking to expand internationally—only 12% of its subscribers are outside the United States.

E

EDITING, ONLINE AND DIGITAL

Ensuring the accuracy, clarity, and continuity of online media is an added layer of complexity to the traditional news editing job. Factors include the speed of publication and the variety of publishing platforms that journalists serve, including websites, podcasts, video distribution, and social media. Editing in the online or digital space is often about creating workflows to prevent errors while also trying to fulfill the expanding role of multimedia storytelling. This pressure is there for traditional print or broadcast newsrooms serving digital platforms, and for exclusively digital organizations. This entry first discusses how news organizations have approached editing as the online platforms used to distribute news content have evolved. It then looks at the expanded roles of online editors as a result of layoffs and consolidation in the news industry.

Editing for Distribution to Multiple Platforms

The demands of online editing have shifted from the 1990s, when most news organizations made their first concerted efforts to move content to websites. While there were early experiments in distribution through teletext as early as the 1970s, most consumers found their first online news experience through Prodigy or America Online homepages with headlines and short text stories. That shifted when much of the American

workforce got a computer at work or home connected to a web browser in the late 1990s.

At first, news websites were text-heavy and used what was created by the existing newsroom. The majority of newspapers and magazines were publishing stories to their websites that were nearly identical to their printed counterparts, and often on a similar schedule. Broadcast television and radio newsrooms frequently published scripts to their website without editing. These were derided as “shovelware,” meaning the publication was not creating content specifically tailored to the web experience, but shoveling what it had onto the site. But, it was also the first taste of hour-to-hour publication for newspapers and longevity of information for broadcasters. News sites started to compete on breaking news, and by 2000, the audience might choose CNN, *The New York Times*, or NPR from the work desktop for a midday update.

Online staffs started out small, often just one or two employees charged with getting stories published, advertisements placed, and keeping the site from crashing. In 1999, the Online News Association was founded, in part to establish the professionalism of these workers. Stories were generally handed off to the online editor after they had gone through the existing newsroom workflow, including multiple editors. The content management system that hosted the database of content to be displayed for the audience was often difficult to manage and required specialized knowledge to publish a story. This process was slow but was

seen as necessary to ensure the quality that professional journalists associated with their craft.

Curation and Crowdsourcing

During this time, blogs emerged as a cultural force that upended the formal tones and rules of publishing. The World Wide Web had meant that anyone could become a publisher and didn't need a printing press to reach a mass audience, but blogs made that level of mass media accessible without any technical skills. Anyone could start publishing information and opinions with character and speed. Some newsrooms accepted the medium as a way to circumvent the multilayered editing process without changing their approach to the main content. Blogs sprung up in newspaper newsrooms by the hundreds, providing reporters a direct line to readers and the possibility to serve niche audiences. Some argued that this new method of content publication did not require the oversight of editors, especially multiple editors, while other organizations required the same review as all other copy.

Many news organizations opted to allow community members to publish their own blog alongside the journalists. While this was hotly debated, it led to a wave of citizen journalism both within and outside of traditional news organizations. Online editors had to make difficult decisions about their role as publishers and what was acceptable to publish from nonprofessional sources. Citizen journalists often did not adhere to the strict ethics that journalists were used to following. The opportunity to fill web pages with more text, and therefore generate more pageviews, was a strong motivator for many publications that were already cutting back newsroom staff. This was quickly followed by a trend of curation by publications that hired only editors, to source stories from the public and summarize stories from other outlets.

More Complex Storytelling

Between 2000 and 2010, the wide adoption of Adobe Flash allowed websites to display videos and present interaction, instead of just text and images. Streaming video meant that files did not have to be downloaded to the end user's computer

to be viewed. The possibilities for storytelling outside the limits of traditional media were evident. Online editors were evangelists for experimentation and teams expanded to have their own storytellers. Legacy print newsrooms hired programmers and videographers to straddle the lines between digital editors and reporters. This complicated the workflows and editing structures at many organizations.

Starting around 2007 with YouTube, many previously complex tasks of web publishing became a matter of copying and pasting an embed code (a snippet of code that can move a digital element onto a new website). Improvements in content management systems made them more intuitive. For some organizations, this resulted in a shift of the responsibility for publishing on the website, from a specialized web team to the other newsroom editors or even reporters. This burden fell most heavily on copy editors. Web editors then took over telling larger and more interactive stories. Newsrooms created jobs for high-level editors who worked with reporters early in the assignment phase of reporting to consider how a story could best be told and displayed online. Any type of newsroom might produce video, audio, animation, photos, text, polls, graphics, and a host of emerging technologies. It has become the digital editor's job to know the strengths of each modality, support the production, and then review content to ensure it meets standards for quality and accuracy.

Beyond Websites: Social Media and New Platforms

Much like blogging, Twitter changed how newsrooms understood what it meant to publish. Editors act as gatekeepers who manage the flow of what gets published. Suddenly there was a firehose of information flowing from millions of users around the world. Reporters needed to join the conversation to stay relevant, but doing this does not fit well with a chain-of-command editing structure. Character limits on tweets often precluded the use of AP style and source attribution that journalists would employ in a news story. Reporters generally have their own social media accounts and publish without editing, but most organizations have robust guidelines on what is

appropriate. Specialized editors rework stories for the main social media accounts for news outlets. This work requires the editor to understand the conventions of the platform and the audience's expectations.

A story now has to have a plan for how it will be told online, through social media and potentially through a legacy print or broadcast channel. But more platforms for publication continue to emerge. Podcasting is one that has become a part of daily life for many Americans and is now a regular part of the story publication options for many large newsrooms.

Shrinking Editing Staff and Expanding Roles

Just as digital publishing work was being moved into the general newsroom, cuts were happening throughout the industry. Since 2010 copy editing jobs have been the hardest hit by layoffs and consolidation by large chains of newspapers or broadcasters. Copy editors, the staff who work primarily with a print production team as a last line of defense for errors and clarity, added digital production to their tasks. Those editors writing headlines must include search engine optimization techniques for web headlines so the story can be found by Google or other search platforms. Many digitally savvy publications even test multiple headlines for a single story to see which gets the most clicks. The speed of publication switched from daily to hourly in often just minutes.

At the same time, there is a demand for expanded journalistic skills and editor proficiency. Numeracy is more important than ever with increasing production of data journalism. These stories are often produced with visualizations and graphics and need close editing. Fact-checking has become a genre of journalism on its own, but every editor must be well-versed in verification techniques. The role of editing for digital and online is more complex than ever and increasingly vital for every news organization.

EDITING, PRINT MEDIA

Editing encompasses a broad range of activities through the print production process. At the beginning, editors decide what to publish and what form the information should take. During the reporting and writing process, editors guide writers in terms of structure and content. When an article is finished, editors prepare it for publication. Editing is crucial across all print media; for journalism, this includes newspapers, magazines and books, and websites.

Editors deal with both large issues and small details. These details include creating a vision for a publication; assigning articles and visual components; evaluating articles for proper organization, tone, and readability; managing and motivating staff; checking facts and sources; correcting grammar, word usage, and other writing mechanics; writing display type such as headlines and summaries; and often designing print pages, as well.

While the editing process is generally invisible to readers, editors shape everything readers ultimately encounter. Editors need to see a publication more broadly than other staff members, serving as gatekeepers of information and protectors of a publication's integrity through adherence to its mission and its standards of ethics and quality.

Many other specialty areas of editing exist aside from journalism. In fields like finance, law, and medicine, technical editors handle specialized

books, journals, pamphlets, reports, and training material. Editors oversee newsletters, advertising, press releases, video scripts, product documentation, and online help pages. Nearly any type of published material moves through the hands of editors.

This entry discusses print media editing as a profession and the impact technology has had on editing and the editing profession.

Evolution of Editing

The word “editor,” first meaning the publisher of a book, originated in the 1600s and over the next 200 years took on the journalistic meaning ascribed to it today. Editing as a profession began to take shape as the number of newspapers, magazines, and books increased, and as publications grew in both size and readership. The first editors were printers who reprinted articles from other publications (often from abroad) and sometimes added their own commentary. Printers took their role as editors seriously, however, even if they didn’t call what they did editing. Benjamin Franklin (1706–1790), for instance, published “An Apology for Printers” in his *Pennsylvania Gazette* in 1731, saying, “Printers do continually discourage the Printing of great Numbers of bad things, and stifle them in the Birth” (quoted in Pickett, 1977, p. 30). He asserted his right to print controversial material, though, much as editors have done in the nearly three centuries since. That function eventually became known as gatekeeping, with editors deciding what to publish or not to publish, free of government control or outside influences.

Magazine editing was primarily a part-time job until the late 19th century, with clergymen or professors often doing such work in addition to their primary employment. Top editors at American newspapers were often (or worked closely with) politicians or civic figures. Publications retained their political or religious ties and editorial identities for years even as editing grew into a full-time occupation. Gradually, publications began actively reporting news rather than waiting for information to trickle in from outsiders and other publications. This broader role increased the importance of editors, who directed the coverage.

These changes took place as rising literacy rates in the 19th century helped create more demand for reading material, improved printing technology allowed newspapers and magazines to easily print thousands of copies, and improved transportation allowed for wider, quicker distribution. By late in the century, circulations soared into the hundreds of thousands among big city newspapers and some national magazines. Many of the architects of these mass circulation publications, like Joseph Pulitzer (1847–1911) of the *New York World* and William Randolph Hearst (1863–1951) of the *New York Journal*, served as both publishers and editors, guiding both the business and news operations. Others, like Cyrus H. K. Curtis (1850–1933), hired editors like Edward Bok (1863–1930; editor of *Ladies’ Home Journal*) and George Horace Lorimer (1867–1937; editor of the *Saturday Evening Post*) and allowed them to shape their publications as they saw fit. A gap developed, though, between editors who ran large publications and those who ran smaller ones. On one hand, those in cities saw themselves as outsiders, of sorts, observers whose detachment allowed them to get closer to the truth. Small-town editors, on the other hand, saw their role as voices for their communities. Hodding Carter (1907–1972), editor of the *Delta Democrat-Times* in Greenville, Mississippi, said in 1961 that an editor should be “the community’s chronicler, commentator, and general hell-raiser,” but also a citizen fully participating in the life of the community.

As print journalism expanded into the digital space, so did editing. Instant feedback through social media and detailed digital analytics have helped editors become far more aware of their audiences and the importance of engaging them. Print editors also use or assign digital-only storytelling tools such as interactive graphics, data visualizations and video, since most print media have websites, apps, and social media through which they distribute and publish content. Marty Baron, editor of *The Washington Post*, said in 2016 that the changes in how people communicate and get their news brought on by the digital environment meant that the *Post* needs to understand and be part of that digital environment.

Divisions of Labor

Differing philosophies of editing developed not only because of the size of the communities but also because of the growing size of the publications. At smaller publications, a single editor often does much of the work, including the writing, photography, and design. Newspapers in metropolitan areas and mass circulation magazines contain larger volumes of information and need larger staffs with specialized editing roles. Top editors set the direction and policy for a publication and still do hands-on work with articles. Other editors, though, oversee content areas such as world news, sports or entertainment, and opinion pages. Below those editors are assigning editors who work closely with reporters and freelancers in deciding what articles to pursue. All editors use their sense of audience to pare down thousands of potential topics and articles into the relatively few that make it into publication. Editing of all kinds is linked to this gatekeeping function, as all editors have at least some control over what readers see.

At newspapers, managing editors oversee newsroom operations, including staffing, budgeting, and news coverage. Section editors guide coverage, assign stories, and manage reporters for sections such as news, business, sports, and features. Photo editors oversee photographers much as assigning editors oversee reporters. Wire editors choose articles from the Associated Press and other wire services, which provide thousands of articles from around the world.

Copy editors, sometimes called *subeditors*, focus on the mechanics of articles, including proper grammar, spelling, and structure. At newspapers, these editors also write headlines, design pages, and see everything through to production. Because they usually have no part in assigning an article, they can examine the writing and reporting with a fresh eye, seeing problems that those close to the reporting may have missed. Copy editors are usually the last to look over an article before publication, inspecting the article again on a proof, or copy of a page, a process known as *proofreading*. These editors are often referred to as the “last line of defense”—spotting and fixing problems before publication—but also as the

“first reader,” meaning that they serve as an advocate for the audience, ensuring clarity, relevance, and credibility. The editing system was set up as a means of quality control. At many publications, articles make their way through at least two editors, sometimes more for a particularly complicated or controversial article. Staff cuts have forced changes in that approach, though, and many articles are reviewed by only one editor, and sometimes by none at all.

Magazines have a structure much like that of newspapers, though the duties often differ. The top editor, often called the *editorial director* or *editor in chief*, sets the overall vision for the publication, working closely with the publisher, the advertising department, and even the marketing department. A managing editor or executive editor oversees day-to-day operations, including deadlines, hiring, and production. The managing editor may also fill in for other staff members, writing, designing, and taking on any job that needs to be done. At smaller magazines, which may have only a few staff members, the managing editor does all these things routinely. At larger magazines, many other specialized or associate editors work beneath the managing editor, overseeing a magazine’s many departments. As at newspapers, copy editors check the language and clarity of an article, though magazines often have separate fact-checkers, a job that falls to copy editors at newspapers. Some magazines also have what are called contributing editors, who are freelance writers with expertise in specific areas.

At nearly all publications, an editor’s duties frequently change from day to day, depending on a publication’s needs. So even though editing involves many specialized skills, the best editors are generalists who can adapt easily to different tasks or different roles. Ben Hibbs (1901–1975), then editor of the weekly *Saturday Evening Post*, said in 1959 that magazine editing had become a team job, “simply because the volume of work is so vastly greater and also because no one man can even hope to possess a sufficiently all-embracing knowledge of this complex world to do the job alone.” Much about editing has changed since then, but the complexity and the need for many people to create a publication persists.

A Move Toward Professionalism

Editing, like many other jobs inside and outside journalism, became increasingly professionalized at the turn of the 20th century. Organizations like Sigma Delta Chi (now the Society of Professional Journalists), American Business Media, and the Associated Press Managing Editors established professional and ethical guidelines, and industry publications like *Editor & Publisher* and *Quill* helped editors further define their mission and their responsibilities. Universities created journalism programs, helping enhance journalists' education and reinforcing the idea of editing and reporting as professions with standards of quality, ethics, and judgment.

Over the course of the 20th century, many other organizations have formed, allowing editors to share ideas, solve common problems, and make their jobs more visible. Magazine editors, features editors, opinion page editors, photo editors, and designers all formed organizations. Copy editors and metropolitan editors formed separate groups. These organizations have focused on such issues as training, maintaining quality with smaller staffs, and using digital platforms. This proliferation of organizations solidified the specialized roles and functions of editors within journalism.

As part of this move toward professionalism, editors concentrated more on providing information free from the influence of advertisers, political parties, or religion. This idea of reporting and editing with a seemingly neutral viewpoint became known as objectivity. It developed in the late 1800s and grew into a central tenet of journalism, although some in the field have questioned its relevance. Even journalists who don't subscribe to the idea of true objectivity work to uphold standards of fairness and ethics, two crucial functions of editing.

Technology Reshapes a Profession

Technology had already begun to change editors' jobs enormously in the late 20th century. Computers allowed publications to be assembled much more quickly and with fewer people. Editing once done on paper could be done more easily with computers. Emphasis on visual communication increased, attracting a new type of editor whose

job focused more on creativity and design than on content. Computerized page layout increased the workload of copy editors and news editors substantially as they took on technical work once handled by compositors and typesetters.

As information became more widely distributed through online platforms and available to much broader audiences in the early 21st century, digital-only journalism startups moved from the margins to the mainstream. Many of these organizations adopted some of the structural characteristics of traditional newsrooms, including editors at various levels; at the same time, many legacy news organizations altered their structures to become more streamlined. Top editors have become more involved in the business aspects of their companies, rather than focusing solely on content.

During the first two decades of the 21st century, print media were decimated. The pervasiveness of the internet, the rise of social media, and the Great Recession resulted in plummeting print circulation, the closure of hundreds of newspapers and magazines, and the loss of thousands of print media jobs. Editing jobs were among those cut most substantially and have been the slowest to recover. As the number of employees shrank and the number of platforms expanded, the editorial hierarchy flattened and the editing timeline contracted. Most publications reduced the number of editors who "touch" a story, with print copy editors often getting a story that had already been published online with little to no editing. Many editors have questioned the logic of that approach, arguing that it compromises credibility and reliability. Online journalism also forces editors to make decisions more quickly, much as a wire service does, balancing timeliness with the need to check accuracy, especially as rumors and disinformation spread through social media.

Such changes have caused anxiety among editors but have also created opportunity. Online readership has been rising, and many editors see the digital sphere as the future of journalism, with print publications still playing an important, though smaller, role. The skills of print editors transfer easily to the Internet. A report by the Online News Association said that word skills remain at the heart of digital editing, along with

news judgment, attention to detail, knowledge of style and grammar, communication skills, and the ability to work under time pressure. Online editors, sometimes called *producers*, need computer-related skills, as well: a grasp of coding, audio and video production, and software to create graphical elements. The report concluded that much of what online journalists would be doing was traditional copy editing, so they should be trained for that work.

Technology has brought about other changes. Computers have allowed journalists to create graphics much more quickly, leading to a proliferation of charts, maps, and other types of illustrations. As a result, some publications have created the position of graphics editor, keeping in the tradition of editing as a specialized function; other publications have created design desks. Some publications have appointed editors to oversee digital operations, while others have pushed print editors to gain skills in publishing material online. The advent of digital analytics in the 2010s provided far more specific and detailed insights into what readers choose to read, how much they read, and what they do after they have finished reading. This information has removed much of the guesswork about audience preferences and thus influences the choices editors make related to coverage, presentation, and even headlines. In a sense, this has turned readers into editors, giving them a hand in the gatekeeping function that was once the sole purview of editors.

The importance of editing is likely to grow as the role of an editor evolves. Editors' savvy in assigning, preparing, and presenting information has for decades allowed many publications to thrive. As digital platforms become increasingly important as a source of information, editors must adapt their skills to a multimedia world even as they maintain the core language and visual skills that have served them well for decades. As the guardians of credibility and as gatekeepers for information, editors play a role that could make or break a publication, though editing itself is likely to remain in the background. Audiences see little of the editing process even as editors make an enormous mark on journalism.

EDITORIALS

The most notable difference in the modern-day newspaper editorial as of 2021 is its decline, mirroring the disappearance of many daily and weekly newspapers and the overall regression of the industry. However, opinionated commentary thrives in nontraditional formats and platforms that include blogs, partisan cable television hosts and pundits, and a host of web news sites. This entry examines editorial influence and readership, as well as dueling editorialists. The entry closes with a discussion of editorial competition.

Since the first widely published newspaper editorial penned in the United States actually appeared—in Benjamin Franklin’s *Pennsylvania Gazette*—before the United States existed, during the colonial era, on May 9, 1754, the newspaper editorial and the editorial page have undergone drastic evolutionary change—in content and in style. Those first editorials—defined as the official policy, agenda setting, and framing voice of a news operation—often were signed by the publisher, invoking the “we” or “I” editorial voice and addressing various issues. The range of these topics included commentary from pro- and anti-royalty to nationalism, support of or opposition to slavery and entry or neutrality during war as the nation’s political history evolved. Editorials have waned in influence and frequency as the newspaper industry has declined in the late 20th and early 21st centuries. But some newspapers, including such historically notable publications as *The New York Times*, *The Washington Post*, *The Wall Street Journal*, and *The Los Angeles Times*, have carried on the historical watchdog and democratic maintenance function of the newspaper editorial in the present day. Candidates for elective office continue to actively seek editorial endorsement from these and other newspapers; but some publications no longer editorialize at all, while others have decreased their activism from the crusading editorials of the penny press and muckraking era to bland commentary on weather and community boosterism. Blogs and partisan online publications have replaced much of the traditional role of the editorial and have maintained a strong editorial

presence, but without the support of the detailed reporting and factual information that bolstered the traditional editorial page. And, as newspaper circulations have diminished, particularly during and following the era of joint operating agreements, cautious commentary for the most part has replaced the vehement, partisan arguments of op-ed columnists in favor of diverse opinion featuring both conservative and more liberal viewpoints to curry favor from a broader, diverse audience.

A *Pennsylvania Gazette* editorial played a significant role in unifying the colonies and supplying the motto “Join or Die” of the American Revolution two decades later. And in its argument against French efforts to expand the American holdings—in which Franklin argued that the French had violated treaties and attacked colonial traders and murdered farmers while seizing property—it established a prototype of the newspaper editorial’s watchdog function.

What newspaper historians identify as the first modern-day style of editorial, published on October 28, 1783, by George Goodwin and Barzillai Hudson in the Connecticut *Courant*, became the paradigm of the newspaper commentary’s political discourse. Titled “Hartford,” the editorial scolded Connecticut’s General Assembly for its opposition to the proposal in the U.S. Congress to offer full pay for 5 years of service to officers of the former Continental Army. When a people, the authors argued in language representative of the ornate, expressive writing style of the era,

so much enlightened as the inhabitants of this State, suffer themselves to be duped out of their senses by the foes of our independence and British emissaries, who are scattering the seeds of discord in the regions of tranquility, it seems the design of heaven to punish their blindness by some fatal catastrophe, and harden them, like Pharaoh of old, till they plunge themselves into an ocean of difficulties. (As cited in Sloan et al., 1997, p. 41–42)

Such ornamental writing would mark the work of many ensuing editorialists as they strived to make their literary mark on the nation’s political institutions and history. Indeed,

the newspaper editorial, which is the institutional voice of the newspaper publisher and is typically unsigned, is the one place in the publication that makes no pretense of balance or objectivity, serving as the newspaper's—and by extension, the community's—conscience. This is where the publisher most strongly sets the newspaper's agenda by putting forth arguments on behalf of political stances and policy issues. As former journalism professor A. Gayle Waldrop argued in his 1967 book *Editor and Editorial Writer*, the editorial page helps clarify the complex day's events, battles on behalf of the citizens, helps clear the fog of myths and demagoguery, nurtures public opinion, and encourages community dialogue, thus lending a hand to a democracy. The editorial page, Waldrop asserted, lent personality and conviction to the newspaper, invoking a sense of community and wise guidance.

Editorial Influence

Academic research on the influence of editorials—beyond a wealth of studies on effects on elections of endorsement editorials, indicating strong correlation between these editorials and voter behavior—is relatively sparse. But a few notable instances of the power of the written commentary can be found sprinkled through this nation's history. A little-known instance of such effect occurred in May of 1921 when, according to published accounts, an editorial in the May 31 *Tulsa Tribune*, titled “To Lynch a Negro Tonight,” played a role in prompting a riot following the (wrongful) arrest of a young Black man on suspicion of attempted rape. Six years later, after a Black man had been flogged at a country church in Alabama, the editor of the *Montgomery Advertiser*, Grover C. Hall, carried out a 4-month editorial campaign publicizing Ku Klux Klan activities that led to criminal convictions of numerous Klansmen and a decrease in floggings throughout the state. In the 1920s, a series of anti-lynching editorials written by *Norfolk Virginian-Pilot* editor Louis Isaac Jaffe persuaded the governor to put forth anti-lynching legislation, adopted in 1928. The editorials, said Governor Harry Flood Byrd, were primarily responsible for his decision to recommend passage of an anti-lynching law.

An editorial by Jaffe that same year has been credited with creating interest in a federal anti-lynching law.

But not all persuasive editorials focused on political or social issues. Following World War II, a couple of Michigan congressmen, responding to a 1949 editorial in the *Jackson (Mich.) Citizen Patriot* by Carl M. Saunders, urging establishment of a national day of prayer in response to increased international tensions during the Cold War, introduced a joint resolution that earned unanimous approval and a proclamation by President Harry Truman designating Memorial Day as a day of prayer. Some editorials find their way into the Congressional Record. In 1953, Don Murray of *The Boston Herald* wrote a series of more than a hundred editorials on national defense—based largely on reporting and interviews with congressional and military leaders—that were cited in congressional debate on defense spending. Two years later, a *Des Moines Register* editorialist wrote a commentary aimed at Soviet Union Premier Nikita Krushchev inviting Soviet representatives to visit Iowa to observe U.S. agricultural techniques and practices, which helped thaw diplomatic relations between the Soviet Union and the United States.

Editorial Readership

Few academic studies have been conducted of newspaper editorial readership—the primary focus of this section, as broadcast editorials have been relatively rare—or demographics. But anecdotal evidence suggests that political and social elites—including elected representatives, policy makers, captains of business, industry executives, academics and scholars, and religious leaders—are reliable and steady editorial page readers. One of the stronger confirmations of this notion came from the urging by *New York Tribune* editor Horace Greeley during the Civil War that President Abraham Lincoln declare slavery's end. Lamenting the president's slowness in making such a proclamation, Greeley urged in an 1862 open letter to Lincoln that the president uphold the Confiscation Act. Lincoln read Greeley's editorial page, and this particular commentary has been credited with prompting Lincoln to issue the Emancipation Proclamation.

Dueling Editorialists

Greeley was one of several editors plying their trade during the Penny Press era, which followed the pre-1830s era of the Partisan Press, when newspapers were published by political parties. It was a journalistic age that saw a rise not only in sensationalistic news coverage and an expansion of daily newspaper reading into the middle classes. It also witnessed the broadening of editorial topics, mirroring the extension of story subjects, into the arenas of entertainment, sports, and high society. These journalistic phenomena prompted fierce competition for readers and for the advertising dollars that had replaced political patronage in financially supporting newspapers.

It was an era of dueling journalists that lasted well into the 20th and current centuries. At least one of those duels became physical when, on October 7, 1835, James Gordon Bennett, publisher and editor of the *New York Herald*, was accosted on Wall Street by Dr. Peter S. Townsend, associate editor of the *New York Evening Star*. In an anti-immigration tirade, Townsend told the crowd that had gathered that Bennett was a foreigner of dubious quality and that he, Townsend, would not permit Bennett to walk the street. Of course, such physicality was not the normal manner of expressing political and philosophical differences in the penny press newspapers, nor of the partisan press era or of the so-called Golden Age of journalism newspapers of William Randolph Hearst, Joseph Pulitzer, E.W. Scripps, and Henry Raymond of the yellow journalism period—a time that saw the newspaper editorial relegated to a particular section of the daily newspaper, the editorial page. All these organs flourished in a journalistic environment in which cities had more than one daily newspaper. These competing journals offered readers a vast menu of different opinions, ideas, and reportage, offering what media analysts have identified as a marketplace of ideas, derived from John Milton's *Areopagitica*, written in 1644, in which he put forth the notion that truth would arise from a mass of competing, varying opinions and ideas.

Vigorous editorial debate among newspapers dates back to the post-Revolutionary War period. After the young nation won its independence from Britain, these partisan newspapers participated in

heated debate over the writing and adoption of a constitution, including the 85 essays comprising the Federalist Papers and published in three New York newspapers. Following the constitutional convention and the signing of the document in 1787, a heated editorial debate ensued over ratification. Two competing Boston newspapers published opposing arguments, with the Federalist *Massachusetts Centinel* maligning the antifederalists as ignorant and short-sighted with ignoble intentions. The antifederalist *American Herald* countered with an argument that Boston trade should be transferred to Philadelphia and religion abolished.

The advent of the penny press prompted an increase in dissonant editorial voices, particularly in New York City, which had become by the 1830s the center of journalistic enterprise. Benjamin Day's *New York Sun*, and his competitors, including Bennett, Mordecai Noah's *Evening Star*, James Watson Webb's *New York Courier and Enquirer*, and Greeley's *Tribune* carried on a daily newspaper war, disagreeing over matters of minor and major importance that included frequent derogatory references, by name and publication, to their rivals.

The Civil War and the politically divisive years leading up to it predictably fomented considerable editorial debate. Following the secession from the union of South Carolina, followed by six other states in 1860 and 1861, *The New York Times* pushed for compromise but then chastised the newly elected President Lincoln for what *Times* owner Henry Raymond saw as a weak response to the secessions. Greeley's *Tribune*, though, argued that the states should be allowed to depart.

One more example, this one involving regional, rather than local, editorial differences offers evidence of the sort of vigorous debate in which newspapers have engaged on their editorial pages. On the morning of September 15, 1963, a Sunday, a terrorist bomb attack at the 16th Street Baptist Church in Birmingham, Alabama, killed four young African-American girls, blinded another, and injured 22 worshippers. The governor of the state at the time was George Wallace, an avowed segregationist who famously had stood in the doorway at the University of Alabama in June of that same year to block

entry of two African-American students and who worked vigorously to oppose desegregation of Alabama public schools, in defiance of the 1954 U.S. Supreme Court decision desegregating public schools. His campaign and inaugural slogan was “segregation now, segregation tomorrow, segregation forever.” As they had during various civil-rights era events, including the freedom rides, diner sit-ins, and the Selma marches, the Northern and Southern newspapers entered into vigorous editorial debate concerning this bombing. But they focused on different aspects, with the Northern newspapers highly critical of the governor and the Southern segregationist press framing the tragedy in a false-equivalency light.

The New York Times, the nation’s newspaper of record, strongly criticized Wallace, who had expressed an emotion of sadness by all Alabamians over the crime, for his use of state resources to shutter Birmingham schools. The newspaper praised the African-American leadership for helping to avert violence.

Rather than blaming the governor, a prominent Southern newspaper, the Charleston, South Carolina, *News and Courier* spread the blame among everyone but Wallace—from organized labor to the federal government and civil-rights leader Dr. Martin Luther King, Jr. Terrorism, the newspaper argued, was not unique to racial tension. As evidence, the editorial author cited labor union activists tossing bombs in Tampa, the recent bombing of a Chicago city councilman’s home, and the violence of muggers in the streets of big cities. At the same time, the editorial argued, the federal government, in applying pressure to the states and Martin Luther King, Jr., played a role in encouraging violent activism. *The Birmingham Post-Herald* blamed the African-American community, arguing that while the perpetrators must be captured and punished, the African Americans who had stoned police cars should be arrested and severely punished.

A Continuing Phenomenon

Such editorial competition, whether local or regional and which remained energetic through most of the 20th century and into modern times, continues somewhat at the national level as of

2021, but at a considerably lessened pace. Newspapers that include *The New York Times*, *The Washington Post*, and *The Los Angeles Times*—all enjoying a national audience—continue to offer distinctively differing opinions on political and social subjects of a national character. But most major U.S. cities now have only one printed daily newspaper, if any at all, as newspaper ownership has become more concentrated, numerous daily newspapers have gone out of business, and the Internet and social media have gobbled up the advertising revenues that once were the primary revenue source for vigorous and vital smaller market newspapers. The result has been a shrinkage of the marketplace of ideas, particularly at the local, community level, that once was considered vital to a vigorous, thriving democracy.

To be sure, newspaper editorials continue to play a vital role in the American political conversation, especially in those cities that still have a strong newspaper presence. These include Los Angeles, Chicago, New York, Atlanta, Washington, DC, Seattle, Miami, and Dallas—each of which has at least one daily newspaper. Politicians still covet editorial endorsements from these organs. But other news and information sources are drowning out these print editorial commentaries with opinion diatribes that lack institutional heft and blur the lines that once were so clearly demarcated between the media’s editorial and straight news content. Internet bloggers, radio call-in programs hosted by celebrity commentators, cable news outlet punditry found on outlets ranging from the ultraconservative FOX News to the more liberal MSNBC and moderate CNN, all offer opinions of politicians, program hosts, analysts, and guest newspaper columnists in a potpourri of right and left commentary reminiscent of the days of the Partisan Press. More and more, these voices, rather than offering a vigorous marketplace of ideas, serve as echo chambers, commenting upon and arguing viewpoints to an audience seeking affirmation rather than informed, truthful insight. Thus, newspaper commentary has experienced diminished esteem and influence. Newspapers’ traditional role as respected voices of authority independent of government and policy makers has waned due to their diminished use

of the editorial page to set a vibrant social or political agenda.

One aspect shared by newspaper editorials from the colonial days to the 21st century is their adherence to the basic capitalistic and democratic principles of the United States. Critical media scholars have identified this phenomenon as the influence of overriding (traditional) liberal, democratic ideals that permeate the arguments and logic of newspaper editorials of all political flavors. These scholars have identified ideology as the dominant influence of media content. Indeed, newspapers as ideologically opposed as *The Wall Street Journal* and *The Washington Post* agreed editorially in their support of the decision by the administration of President George W. Bush to invade Iraq in 2003 and of the buildup to that military action. The editorials agreed on the underlying goals, on behalf of freedom and anti-terrorism, in arguments supportive of the military action.

Bloggers, newspapers, cable television channels, online news sites, and commentators—most of these organizations, other than newspapers, do not have editorials or editorial writers but instead rely on partisan pundits. This faithfulness to democratic ideals of liberty and freedom does not waver. Whether the discussion is about tax or foreign policy, gun control, immigration or a pandemic, constitutional ideals consistently are cited as sacred, regardless of political or partisan interpretation of these precepts.

EDITORS, ROLES AND RESPONSIBILITIES

The word *editor* has many meanings across newspaper, magazine, broadcast, and digital journalism platforms. How it is used in job titles can vary with the size and ownership of a news organization, as well as across national boundaries. As a result, editors' roles and responsibilities also vary by platform, news outlet size, corporate structure, and traditions in specific newsrooms. This entry examines editing roles in U.S. journalism, beginning with print media, the oldest of the platforms.

Newspapers

The highest ranking news manager at a newspaper was, for decades, called simply *the editor*, a title that designated ultimate control over journalistic content. In the late 19th century, as newspapers grew and needed multiple editors in charge of different types of news, some newspapers began using the term *editor in chief* for the person in charge of editorial content. In the last quarter of the 20th century, as newsrooms began to adopt more management techniques from the world of business, *executive editor* became popular for the top news manager. During the first quarter of the 21st century, as legacy newspaper companies emphasized online news and reduced print publication frequency, some began to adopt titles for top newsroom managers that emphasized content, such as *content director* or *vice president of content*—especially if those editors oversaw more than one newsroom or content across media platforms.

Whatever the title, the top manager in a newspaper newsroom generally holds a variety of administrative responsibilities, for content, people, and finances. An executive editor or top content director may do little or no actual editing of articles but does set the tone for coverage by making final decisions on where, broadly, to focus news coverage resources. The editor also generally plays a key role in hiring, choosing among candidates, though within a budget set by the publisher or a corporate newspaper chain's financial officers. In that role, editors can have an important indirect effect on news content, both by hiring knowledgeable workers and by paying attention to the gender, race, and ethnicity of new hires, as diverse newsrooms find sources and stories, and make connections with audiences that homogeneous newsrooms are blind to. Editors are also often the public face of a newspaper. If someone needs to represent the newsroom at a civic function or explain a newsroom decision to the public, the top editor often takes on that role.

Helping the editor in this work at many newspapers is the managing editor, who, as the title suggests, manages the day-to-day business of operating a newspaper and its website. The managing editor is generally more directly involved with content than the executive editor and may review and suggest changes in the biggest or most important articles, as well as help determine which articles get the most prominent play on a newspaper's online homepage and front page. In addition, a managing editor often has some responsibilities related to budgeting, hiring, and innovation. Large newspapers may also have deputy managing editors, assistant managing editors (often referred to by the abbreviation for their title: a.m.e.), or both, newsroom leaders who are responsible for particular areas of news coverage or production. In fall 2020, for example, *The New York Times* had, in addition to an executive editor and managing editor, three deputy managing editors (one for news, one for enterprise and investigative reporting, and one for visualization and multimedia), an associate managing editor for standards, and eight assistant managing editors (overseeing daily online and print coverage; international news; reporting from Washington, DC; culture and lifestyles coverage; audio, film, and

television work; technology and innovation projects; digital tool development; and recruiting journalists).

At the next level down in the newsroom hierarchy, section editors oversee the reporting and writing of news for one section of the website or print newspaper. For example, a city editor, metro editor, or local editor usually supervises reporters covering local news; a business editor supervises the reporters covering business and finance; the sports editor leads the sports reporters; and a features or lifestyle editor supervises the reporters covering culture, entertainment, food, the home, travel, and lifestyle trends. Most mid-sized to large newspapers would have at least those four editors, corresponding to sections of the newspaper's website that likely would be updated daily and sections of the print paper that appeared daily in an era when newspapers published 6 or 7 days a week. (Some formerly daily newspapers now publish in print only 3 or 4 times a week.) The largest newspapers might also have editors for national/international news, political news, state news, science news, food news, health news, and/or travel news, who might oversee reporting on articles for a weekly standalone section or inclusion in other sections. At larger newspapers, some section editors have assistants, such as an assistant city editor, who often leads the department on weekends or at night.

Section editors have traditionally played an important and sometimes overlooked role in the shaping of news. They either assign reporters articles to report and write articles or incorporate reporters' ideas for articles into the "budget" of news coverage for the day. Reporters turn in articles they have written to a section editor or assistant section editor, who reviews them for problems related to facts, sourcing, organization, and legal or ethical issues. For example, a section editor or assistant section editor reading an article about plans to rezone a residential neighborhood for high-rise condo buildings might notice that the reporter talked only to the developers and opponents. The editor might send the reporter to speak to education officials who could address how an influx of new residents might affect already overcrowded schools; to low-income renters who might be displaced by development; or to

transportation experts about whether public transit or roads could handle increased numbers of commuters.

As section editors are studying reporters' work, other editors are thinking about how those articles will be played online and in print. At small newspapers, the editor, managing editor, or even a section editor may design the print pages and move articles into a predesigned online format. Larger newspapers, however, generally have a newsroom leader—sometimes called the *design editor*, design director, visual editor, or art director—whose sole job is to think about how news is displayed. This manager may draw on the expertise of a variety of editors whose work is connected to news production, including graphics editors, who oversee news artists putting together charts, graphs, maps, and artistic illustrations, and photo/video editors, who oversee photojournalists and videographers.

In the past, once a section editor was confident that a reporter had put all the needed information into an article, that editor passed the article to the copy desk. There, a collection of editors, called *copy editors* in the United States and *subeditors* or *subs* in the United Kingdom, reviewed articles for errors of fact, spelling, grammar, punctuation, and style and also considered whether there were legal or ethical issues that had been overlooked by section editors. Copy editors also wrote headlines for articles and captions or *cutlines* for photographs. In some cases, they also determined how pages would look, with a *layout editor* or *makeup editor* designing pages (though that work moved to a design desk in most large newsrooms during the 1980s and 1990s). Copy editors' work was reviewed and approved by the supervisor of the copy desk—called the *copy desk chief* or *slot* because in the first half of the 20th century, that editor generally sat in the center or slot of a U-shaped desk.

In the second decade of the 21st century, however, many newspapers eliminated or consolidated copy desks to save money, as advertising and subscription revenues plummeted. Some newspaper companies created centralized editing and/or design hubs that provided copy editing and/or design for multiple newspapers owned by the same company. Other newspapers outsourced copy editing and design to outside hubs. Still others, including *The New York Times*, decided they

could put more resources into reporting if they did away with some copy desk jobs. *The Times* eliminated most copy editors in 2017 and shifted much of their work onto *backfield editors*, whose responsibilities for reviewing stories had been somewhat like those of assistant section editors at other newspapers. The newspaper retained a small Print Hub to take articles published online by backfield editors and shape them to fit in the print newspaper. Changes of these types saved salary costs but resulted in some spectacular gaffes at newspapers around the country. For example, in April 2018, the *Denver Post*, which was designed remotely, published a guide to the Colorado Rockies baseball season that mistakenly featured, on its cover, a large photograph of the Philadelphia Phillies' ballpark. And the need for checking facts did not go away. Less than a year after *The New York Times* eliminated copy editors' jobs, it profiled a fact-checker and *fact-check reporter* hired in the Washington bureau. In June 2020, when controversy erupted in the *Times* newsroom over an opinion essay by U.S. Sen. Tom Cotton, which the newspaper concluded it should not have published, top editors said they would be expanding their fact-checking operation.

Magazines

To some extent, the roles and responsibilities of magazine editors parallel those of newspaper editors, though there are some key differences. But editors' work can differ within the magazine industry, depending on whether they are putting out a small monthly trade publication, a quarterly university public relations magazine, a city magazine backed by business interests, a national magazine covering serious news and politics, or a fashion magazine with multiple international editions. In fact, journalists John Morrish and Paul Bradshaw have observed that magazines are so diverse in their business models, the size of their publishers, and the media they use that there is no single magazine industry but, rather, several magazine industries.

Still, all magazines have a top editor, sometimes referred to as the *editor in chief*, who oversees content, people, and budgets—just as the top editor at a newspaper does. Because print magazines generally are published monthly or quarterly—or

at least no more often than weekly—editors and managing editors are able to scrutinize content to a greater extent than daily newspaper top editors. They often read sensitive articles, pay particular attention to covers, review final proofs of an edition, and take note of which articles are drawing interest online. In addition, at least at national consumer magazines, editors are responsible for building the publication's brand. Ruth Reichl, former editor of *Gourmet*, a food magazine founded in 1941, has said that at the beginning of her tenure in 1999, much of her job was creating a magazine with a point of view that both readers and advertisers liked and then joining the publisher in selling the magazine, by persuading companies to purchase advertising in it. By 2009, the year publisher Conde Nast closed *Gourmet*, her job had changed dramatically, to using social media to promote the magazine and build anticipation among potential subscribers about upcoming issues as well as producing products (a website, a cookbook club, a book about cookies) designed to extend the magazine's brand. Her work, focused on long-term planning, had little to do, she said, with actually editing a magazine. Ten years later, in 2019, *Teen Vogue* editor Lindsay Peoples-Wagner echoed those sentiments, saying that important parts of her work involved rebranding the magazine, which closed its print edition and went fully online in 2017, hiring new staff members, and planning for an event the magazine produced, the Vogue Teen Summit.

Broadcast News Media

The title *editor* is less frequently used in broadcast newsrooms. A variety of television news journalists, however, do jobs that are similar to those of print editors, in that they sift information to create timely, interesting, and accurate news reports. The journalists in the typical local television newsroom can be divided into two groups: people who gather and/or deliver the news on air (anchors, reporters, and videographers) and people who produce the news behind the scenes (news directors, producers, assignment editors, video editors). It is this second group whose roles are most like those of print editors.

In the typical local television newsroom, the top manager is the news director, whose

responsibilities are similar to those of the executive editor of a newspaper or editor in chief of a magazine. The news director often oversees a budget for newsgathering worked out by the station's general manager, who oversees all aspects of its operation, as a newspaper or magazine publisher does. The news director also hires newsroom employees and sets the tone for the operation's approach to journalism. At larger stations, the news director may be helped by an assistant news director, who may review scripts or online articles as well as help supervise newsroom employees.

Those employees include producers, who act, in a sense like section editors at newspapers, overseeing particular news shows, such as the morning news, the noon news, or the 10/11 p.m. news. (Some television newsrooms have an executive producer who oversees all the local daily news.) The show producers are responsible for working with reporters covering stories to build the “rundown” for the show, a list of the stories that will appear in the broadcast, in the order they will air, and adjusting that rundown as news breaks or stories fall through. Producers review scripts written by reporters, and anchors rewrite as needed. They also write story “teases,” text that lets viewers know what's coming up next, and monitor the newsgathering of reporters and crews working on stories for their newscast.

Two television newsroom employees whose titles do contain the word *editor* have very different roles and responsibilities. The assignment editor is a newsroom manager who oversees the assignment desk, which keeps track of news releases and the timing of events that require coverage, such as news conferences or trials. In addition, the assignment editor monitors where news crews are during the day, in case they need to be rerouted to cover breaking news. The videotape editor, in contrast, is not a manager and is often viewed almost as a technician, responsible for taking raw video from a broadcast photojournalist and joining shots together to form the visuals for a news package.

Digital News

Editors' roles, responsibilities, and job titles on digital news sites are much less standardized, for three reasons. First, online news media are still

relatively young, with less than 25 years of history, and simply have not had time to develop a common vocabulary and set of routines. Second, digital news encompasses a broad range of outlets, from local independent online news sites (LIONS), largely funded by foundations and operating with relatively few staff members, to large operations such as HuffPost. Third, many digital news sites are offshoots of print or broadcast news media and either is largely produced in those legacy newsrooms or rely on an inherited organizational structure. In a 2011 study, for example, that asked U.S. daily newspaper managing editors to give the title of the senior decision-maker for their newspaper's website, 144 respondents gave 73 different titles.

Some online-only news websites, however, have an organizational structure that at least draws on that of newspapers. For example, in fall 2020, BuzzFeed News had an editor in chief (who used to work for the *Wall Street Journal*, a newspaper); executive editors for strategy, technology and society, and culture; a deputy editor in chief; a managing editor; and editors, a bit like newspaper section editors, in charge of coverage of such topics as politics, science, government, and inequality.

EDUCATION, COVERAGE OF

Media coverage of education largely revolves around a broad swath of K–12 issues related to students and teachers and to a lesser extent higher education. Coverage generally focuses on curriculum, test scores, teacher competency, and graduation rates at the public school level. Higher education coverage centers primarily on the cost of and accessibility to colleges and universities by middle-class and minority students. This entry opens with a brief overview of early education coverage and then examines the role of the federal government in education coverage. The entry also discusses criticism of education news and trends in education reporting, as well as coverage of higher education and the impact of the Internet on education news.

Much of the coverage since the 1960s has largely been framed by policies and regulations issued by the U.S. Department of Education, which became an independent cabinet-level agency in 1979 during the administration of President Jimmy Carter (1977–1981) after decades of operating as part of the former U.S. Department of Health, Education, and Welfare. Education's new department status gave federal education policy more gravitas, with federal regulations and laws increasingly anchoring coverage of schools. National media often emphasize federal policy issues, while smaller media outlets tend to devote more coverage to school boards and the politics that often engulf them. Since the 1980s, however, the trend toward broader coverage of schools and the issues that affect them, such as poverty or homelessness, has appeared prominently in all media outlets, as K–12 issues and access to higher education are increasingly framed as significant domestic issues. And since 2000, stories about education on the Internet, the burgeoning cost of higher education, and a seeming resegregation of some K–12 schools have increasingly been produced by national media.

Early Education Coverage

At the turn of the last century, coverage was sporadic, with schools rarely providing the anchor for stories about education. Coverage instead focused

on issues affecting children more generally, such as child labor, a significant issue of the day. Only occasionally did journalists address the impact of lost educational opportunities for working children and youth. A leading voice in the campaign to halt child labor—and to expand a child's educational opportunities—belonged to a New York City schoolteacher, Lewis Wickes Hine. In an article representative of the era's coverage, with education as a secondary theme, a 1911 report in the *San Francisco Call* bemoaned the thousands of children and young people roaming the streets, as child labor laws resulting from Hine's campaign barred children from working. The pursuit of education is rarely mentioned, but the heightened attention to issues affecting children did ultimately result in school reform. The high levels of truancy, and coverage of the problem in newspapers and magazines, prompted many states to pass compulsory school laws and forced states with such laws to enforce them more vigorously.

In the years that followed, education news was often absent from newspapers, magazines, and radio. But in 1944, *The New York Times* established a standard for education coverage with its Pulitzer Prize-winning series by Benjamin Fine, who reported that high school and college students did not know basic facts about U.S. history. The *Times's* series was the first notable reportage examining the quality of education in American classrooms, and it prompted a campaign by schools, colleges, and universities to upgrade instruction. In 1947, the National Education Writers Association was established by Fine and other journalists from the *Christian Science Monitor* and *The New York World-Herald*, among other publications, to improve the quality of education reporting by emphasizing news from inside the classroom.

Despite the success of the *Times* in making education a relevant subject of news coverage and the creation of the education writers' group, coverage of schools was inconsistent through much of the mid-20th century. Journalists often wrote about schools only after being prodded by events outside the classroom. A case in point is the landmark U.S. Supreme Court decision in *Brown v. Topeka Board of Education* (1954) overturning the "separate but equal" doctrine that had kept schools segregated by race. The volume of education coverage

improved significantly in the years before, during, and immediately after the Brown decision, and journalists applied broad strokes as never before in reporting the case, explaining that single-race schools were often the result of segregated neighborhoods created by discriminatory deed restrictions and redlining that kept whites and Blacks in separate communities. But the coverage was largely framed by discussions about race, not schools. The broader reporting provided context, but it also served to consistently cast education as a secondary theme in subsequent coverage, such as the 1957 launch of the Soviet Union's (and the world's) first satellite, Sputnik. That event generated hundreds of stories about the nascent space race between the United States and the Soviet Union. Journalists wrote about national defense and the United States' own aspirations about space exploration before coverage eventually settled on the need to beef up public education in training future scientists and engineers through the federal 1958 National Defense Education Act, the first legislation by Congress designed to upgrade K–12 curriculum, specifically in math and science, and to provide for the first time student loans for higher education to raise the percentage of Americans with college degrees.

Journalists criticized schools and teachers for providing weak instruction in science, math, and other core subject areas. At the center of most news coverage about education during this era were teachers themselves. Often praised by news media as community servants at the turn of the 20th century, educators by the 1950s, particularly after Sputnik's success, were increasingly portrayed as weak links in the education process. Teacher training at colleges and universities was eventually scrutinized by journalists and universities themselves, which linked the poor caliber of teachers not only to deficient college training but also to low pay that prompted young people to seek employment in more lucrative fields.

Growing Federal Role

During the Lyndon Johnson administration (1963–1969), the U.S. Department of Health, Education, and Welfare (HEW) provided a steady source of education news. Journalists covered schools and education with more balance,

providing deeper explanations about how race and class affected urban schools with schools themselves the anchor for coverage. President Johnson's collection of education programs through his Great Society and War on Poverty initiatives provided a strong framework that helped focus and sustain news coverage. Early childhood education, for example, became a staple of education news for the first time as a result of Head Start, one of the Johnson administration's programs for disadvantaged preschool children.

In 1979, President Carter created the U.S. Department of Education, and a year later, the department opened for operation. In 1983, the department's seminal report, *A Nation at Risk: The Imperative for Educational Reform*, provided an expansive yet focused frame for education coverage, much like Johnson's education programs supplied two decades earlier. The more focused coverage of educational issues in the 1980s produced the first sustained examinations in the widening gap in academic achievement between whites in their affluent suburban schools and minorities in the poorly financed urban schools they attended. The department also increasingly serves as a clearinghouse through its National Center for Education Statistics for a variety of education data gathered annually, and these data have helped inject more uniformity and precision in education coverage in areas of student learning and achievement, teacher certification, and dropout rates.

While the department often provides the impetus for stories, it is also often the object of criticism. The 2001 No Child Left Behind (NCLB) Act, proposed by the department as the central domestic program of President George W. Bush's administration (2001–2009) and later approved by Congress, is widely disparaged by education reporters as deeply flawed legislation that places unrealistic expectations on public schools and their teachers. Investigative reports into NCLB found its flagship reading program ineffective. The Bush administration vigorously defended its \$1 billion a year "Reading First" curriculum designed to enhance skills of elementary school students against critical media reports, but the program was eventually also deemed ineffective by a study conducted by the education department itself.

Complaints About Coverage

Despite the tighter framing for education news supplied by the Department of Education, coverage of schools over the years often has been criticized as simplistic and incomplete. The uneven quality can be explained in part by the stature of education reporters themselves. In many newsrooms, the education “beat” is considered the domain of beginning journalists. But critics maintain that the growing complexity of the topic requires journalists to cover test scores, school finance cases, collective bargaining negotiations, agreements between school boards and teachers, and curriculum issues, all topics critics and studies assert are covered unevenly. The most seasoned journalists, critics argue, should cover schools because lawmakers and the judiciary depend on media coverage to help guide them in their decisions.

In news coverage of *Rodriguez v. San Antonio Independent School District* (1973), for example, plaintiffs in the Texas case over inequities in state funding of public schools complained that journalists offered an inaccurate and unsophisticated analysis of how the funding disparity created inequities in the quality of public schools. It is unclear whether stronger reporting would have made a difference in the Supreme Court’s 5-4 decision against the parents who brought the suit. But their complaints about education coverage are not uncommon.

Unlike the experienced Washington press corps, or the foreign reporting staffs of elite news organizations, the nation’s education reporters exhibit a range of experience, and they serve disparate audiences. Smaller media organizations, such as community dailies or weeklies or small radio stations, tend to cover school board meetings much more closely than do larger outlets. They typically report every vote in stories that often run on the front page. Because school districts are one of the largest employers in smaller communities, education is also covered as a business by smaller media outlets, with the annual school budget and school taxes demanding much attention. By comparison, the larger news organizations write more extensively about education as federal policy, report more often about trends in the classrooms, and interpret the gains and declines of test scores.

And in both large and small media outlets, education stories often are positioned as political stories, with fights over control of school boards between conservative interests and more liberal ones. Critics have bemoaned the framing of education stories as mere meeting coverage, or business or political stories, all of which they say ignore substantive stories about learning and teaching. But in recent years, reporting has once again shifted to more stories on more significant issues. Sophisticated examinations of school violence, and its root causes, for example, have become more commonplace, as experienced journalists assume the education beat, even at smaller media outlets. Of the 1,500 members of the Education Writers Association, only a third in 2006 were considered beginning journalists (those with five years on the job or less), a number that has declined over the last several years.

Trends in Education Reporting

The evolution in education reporting is widely evident in the early 21st century. Broad, contextual reporting, once the domain of publications such as *The New York Times*, *The Washington Post*, and *Time* magazine, is now present more often in regional and smaller media outlets. Despite continuing criticism about uneven coverage, education reporters have produced stories on a wider variety of societal issues and their relationship to and impact on education, with schools consistently serving as the central subject in stories.

The broad sweep and scope increasingly applied to education coverage reflect a growing acknowledgment by editors, producers, and reporters that to write about education in the 21st century also means writing about homelessness, poverty, crime, violence, hunger, and other social ills that have long affected schools but have consistently been, until recently, absent from the coverage. In 2005, for example, *The Dallas Morning News* produced a multipart series about South Dallas, a collection of largely minority neighborhoods in decline for decades. Central to the series was an examination of the area’s failing schools, but the series also explained how the low achievement of students was the result of the area’s low tax base, the thin employment market, and poverty and high crime.

In subsequent months, the newspaper has returned to South Dallas to offer readers updates about reforms and improvements in schools and the neighborhoods that support them.

Investigative and computer-assisted reporting also play a more prominent role in contemporary coverage of schools. In 2008, the *Los Angeles Times* examined plans by the Los Angeles Unified School District to build dozens of new schools across the city. The newspaper, however, reported that many schools were operating at levels well below enrollment caps and that enrollment declines were expected to continue. Because of criticisms by taxpayers in response to the story, the district canceled some building plans but planned to continue the construction of some new schools, arguing that the projects were too far along the planning stages.

In recent years, coverage of both higher education and primary and secondary education also has embraced more of a consumer bent. Media outlets increasingly offer readers, listeners, and viewers news about the best colleges and universities for the money, how to finance a college education, and how to apply for college. In an example of how coverage is more consumer-oriented, *The Boston Globe* offered readers in a prominently displayed Sunday article information on how to shop for a quality preschool and how to determine whether the curriculum is effective.

As the 21st century unfolded, there were rising concerns about a seemingly growing resegregation of public schools. Major school systems across the country—many of them released from U.S. Department of Justice desegregation orders in the 1990s—saw their schools resegregated at levels seen during the *Brown v. Board of Education* era, according to Civil Rights Project at UCLA.

Higher Education

Coverage of colleges and universities has long been overshadowed by K–12 news. In 2008, the *Chronicle of Higher Education* bemoaned the lack of coverage given to higher education by the news media and the implication of that missing news for readers. While sporadic in nature, the caliber of higher education coverage, when offered, has often been more substantive than that of public schools. In the 1990s, media coverage analyzed

tuition rate increases that outstripped the rate of inflation at both public and private colleges and universities; in many cases, journalists reported that proceeds from the tuition increases often supported expanding salaries of university presidents and their administrations instead of funding more scholarships to improve access. Journalists also applied investigative resources in examining shoddy accounting practices by colleges and universities in administering millions of dollars in federal research grants. The controversies prompted Harvard Medical School, among other institutions, to return grant money to the government and resulted in the resignation of Stanford University's president.

In the first decade of the 21st century, coverage focused on access to colleges and universities by minority students and increasingly by those from the middle class. In an example of coverage that explores historical reasons for lack of representation by students of color but that also offers success stories, the *Los Angeles Times* in 2008 produced a report about African American students from disadvantaged backgrounds who graduated from college. The report demonstrated one increasingly common element of coverage: use of the Internet's multimedia platform, which allowed the newspaper to produce a slideshow that featured the students graduating from Grinnell College. Rising tuition costs, too, were often the subject of news reports, the increases outstripping the rate of inflation and student loan debt a theme in the 2020 presidential campaign. But universities responded aggressively between 2010 and onward by guaranteeing free tuition for families earning below specified annual incomes. Stanford University and the University of Texas at Austin were among the growing number of institutions that pledged free tuition to poor and first-generation college students to ensure their enrollments are racially, ethnically, and socioeconomically diverse.

The Internet

The advent of the Internet has helped improve coverage at media outlets of every size. More media outlets posttest scores of public schools, helping parents select the best school for their children, while other publications and broadcast

outlets list tuition rates at colleges and universities in their states. Meanwhile, colleges and universities, as required by federal law, post campus crime reports on their web pages, helping consumer-savvy parents and their children make more informed decisions about selecting a college.

Colleges and universities themselves entered online education in the early 2000s, their presence growing exponentially in the years that followed, as a way to boost enrollment for people working and unable to enroll in a traditional degree program. In 2017, the most recent year available, the number of U.S. college students who enrolled in at least one online, or distance learning, course grew for the 14th consecutive year, according to the National Center for Education Statistics. The growth was not without problems. For-profit online institutions failed to deliver academic or professional training, resulting in shuttered campuses and students being left with loan debt.

These stories, among others, were increasingly produced for online platforms, as newspapers and magazines declined financially in the early 2000s and onward, a result of declining advertising revenue. Journalists have turned to the Internet to write more extensively about local, state, and national education issues in blogs, allowing readers to react more easily by posting comments. The Internet also allows journalists to report a range of continuing challenges surrounding schools with a fresh eye, using slideshows, video, and interactive graphics to frame stories in more compelling ways. Stories about drive-by shootings and murders in urban neighborhoods and the impact on schools and students, for example, took on new meaning in award-winning coverage by *The Philadelphia Inquirer* in 2005 when the newspaper videotaped middle school students talking about their experiences in witnessing and experiencing death.

Though still criticized as incomplete, and often providing uneven coverage of important issues such as immigrants' impact on public schools, contemporary coverage of education is much improved compared with previous decades. It offers consumers important information on which to base a variety of decisions about education from K–12 to higher education.

ELECTION COVERAGE

This entry looks at media election coverage to highlight the advantages of an international perspective, looking across a number of European contexts. It draws attention to a number of common themes and challenges in the relationship between journalism and the political process. These include journalism's self-image as public watchdog, compelled by a shared expectation that media will occupy the center of the political public sphere. Another factor is the persistent influence

of public service media—frequently, though not always, assumed to establish professional standards for political events such as elections—and the extension of public service-oriented aspirations to neutrality into dynamic commercial news environments.

The entry then looks to the various qualities of election coverage across national settings. There is, first, the extensive use of a competitive frame to structure election coverage, including the widespread use of sporting metaphors and a discourse of political contest. These are most noticeable in newspaper coverage of the fortunes of parties and candidates, and the visuals and narrative structure of election night coverage online and on television. By presenting politicians as players in a competitive field, it is suggested that elections are reduced to the expressive field of a race, encouraging a focus on individual politicians over political parties, institutions, and alliances.

The use of public opinion also emerges as an important component of contemporary election coverage. The regularity of references to public sentiments reflects the claimed heritage of journalism as guardians of a shared interest. However, most notably in periods of political populism or economic crisis, formations of public opinion can occupy a place of particular prominence. Representations of *ordinary voters* can be deployed to outsource and lend weight to preferred interpretations of the election and surrounding events. This foregrounding of discourses of the public and their potential for misuse is presented to show how social media and its integration into the main election news text can challenge conventions of journalistic judgment and professional autonomy.

Election Coverage in an International Context

There are particular advantages to the study of media elections, according to Jesper Strömbäck and Lynda Lee Kaid (2008). First, the governmental and material consequences of elections sharpen and accelerate communicative innovation on the part of those seeking office, revealing emergent practices in political communications. Second, the organization of elections as periodic events produces defined data sets for comparative studies across contexts and over time, enabling vertical

and horizontal analysis. Third, the significance of elections as an elemental ritual of democracy weighs on journalists as well as politicians, producing competitiveness among media institutions to host the most iconic election coverage. In recent elections, this has propelled digital visualization and interactivity in broadcast coverage, as well as the tightening of the embrace around participatory media. Fourth, and essential to this entry, the study of election coverage can offer informed comparisons across national, political, and media cultures that serve to identify best and worst practices. The benefits of effecting cross-state comparisons extend even beyond the relationship between journalism and politics to contribute to our understanding of state and culture more generally, assisting a renewed international-comparative perspective on citizenship and media participation.

Regulating the Political Responsibilities of Journalism

The historical responsibilities invested in the institutions of journalism are most apparent at election time, and journalists themselves have political agency. In many national settings, including the United Kingdom, the print journalism sector comprises networks of informal alignment between political institutions and newspapers, delivering positive news and unyielding support to favored parties and candidates. Where regulation is less stringent, cable and online news is also routinely accused of exercising unchecked bias in election coverage, although studies from Taiwan emphasize the latitude enjoyed by cable news can give more space to the political opposition than in state-approved media.

Looking to the conduct of broadcast media internationally, a number of countries are influenced by the public service media arrangement of the type established by the BBC in the United Kingdom. This *dual system* of public service and commercial media prevails across much of Europe as well as in Canada, Australia, and Japan. In contrast with the state-controlled media associated with totalitarian regimes, the relationship between the state and public service media is one of consent, with some measure of regulatory accountability to provide an agreed-upon level of service,

normally measured in terms of the quality and composition of content and the adequate representation of diversity.

However, at election time, in particular, there are instances where stricter public service-related restrictions are imposed across both public service and commercial broadcast media. Occasionally, such as in Sweden, election coverage limits its day-to-day demands to the continued, scrupulous application of public service conventions of balance and fairness. However, a more stringent framework exists in the United Kingdom, where a list of enforceable election guidelines for broadcast are enforced through the Office of Communication (Ofcom), created in 2003. Extending into entertainment genres as well as factual coverage, additional demands come into force at the dissolution of parliament or an equivalent point and remain until the formal close of voting. Obligations include giving appropriate weight to all parties and candidates as well as the representation of all significant views and perspectives. In practice, this means that when one candidate or party receives coverage, so should opposing candidates. Even though these standards are applied assiduously by broadcasters, Ofcom published details of 69 complaints of alleged regulatory breaches in the BBC's coverage of the 2019 UK General Election.

In addition, in a manner that applies equally across all media platforms, a significant number of countries have forbidden the release of exit polls on the day of an election from the opening of the polling station until after voting has stopped, including the United Kingdom, Germany, and Italy. With an eye to such practices as U.S. news networks *calling* elections, this is intended to remove the power of major broadcast organizations and social media clusters to use seemingly emphatic polling data to declare electoral results in advance of their official conclusion or to influence voting behavior.

In emphasizing the variety across national contexts, study of the regimes described in this section can produce telling comparisons across different settings and political traditions. A particular area in which international differences endure is in the variety of commitment to impartiality and its measurement as a means of idealizing and governing the contribution of the institutions of journalism

and determining the responsibility journalism bears toward the quality of public discourse and fairness of political outcome at election time.

The Election and the Mediated Public Sphere

In the context of the communicative and instrumental power described earlier, elections are when the mediated public sphere exercises its greatest power over the public sphere. Jürgen Habermas defines this as the symbolic space in which discussion of matters of shared importance takes place, and public opinion is formed. In the context of the contemporary democracy with its vast number of dispersed interlocutors, John B. Thompson (1995) and others argue that any contemporary public sphere operates primarily through mass media, in parallel now with social media platforms. Indeed, Thompson suggests that the expectations of *mediated publicness* have become an obligation rather than an available strategy for political actors and institutions.

However, in understanding the limits of the public sphere's relationship with international journalism in particular, it is necessary to remain attentive to the particular jurisdictions within which elections occur, be those regions, states, foreign nations, or international unions or federations such as the European Union. Even at the nation level, elections are routinely subdivided into smaller regional divisions, such as parliamentary constituencies in the United Kingdom and cantons in Switzerland. In navigating this environment, news coverage will tend to be guided by the relationship between the expected audience and the election, in terms of participation or interest.

A 2006 content analysis by Michael Higgins shows how these differences in journalistic treatment of elections are manifest in the substate context of Scotland. The first is an obvious point on quantities of coverage, while consequential foreign elections will feature subject to the terms of such news values as *elite nations* and *cultural proximity*, journalists see the greater relevance for them and their audience in domestic elections and will provide more and detailed content. In addition, domestic political election coverage retains an exclusively *bardic* role in advising an audience able to act upon information and

advice through democratic participation. In practical terms, this means that media coverage within an electoral jurisdiction will see a significantly greater weight of concentration of coverage in the lead up to the vote than coverage outside. That is, while domestic media will certainly join with those from outside in reporting and analyzing results, what characterizes media coverage within electoral boundaries is an emphasis on updating and informing an interested electorate on how best to use their vote in advance of the ballot. Across a number of national contexts—including the United Kingdom and France—the celebration of this advisory capability contributes to the abandonment of impartiality in print media in particular, in favor of partisan alignment with election candidates and parties. In Austria, Martin Haselmayer and colleagues (2017) report that newspapers' enthusiasm to report favorable information for their chosen side determines which election stories are selected for coverage.

There is a side effect to this structural emphasis on the nation, which is that political circumstances in which electoral boundaries are complex or contested have tended to produce less journalistic engagement. Specific examples include the coverage of elections to the European Union, where Philip Schlesinger and John Erik Fossum (2007) acknowledge a disconnect between the nation-based media institutions and the cross-national parliament, confounding aspirations to cultivate a more *cosmopolitan* political media for an international age. In elections, as at other times, journalism that is routinely attuned to a national agenda is less adapted to an international news frequency. For this reason among others, the nonprofessional actors of social media and online-based media organizations often emerge as more engaged with debates and political activities above the national level.

Election Coverage and Mediatization

This section covers some of the influences that media exerts over the conduct of elections. Although a highly contested term, the principles of *mediatization* are useful in capturing how the imperatives of media coverage shape the priorities of those political actors and institutions

professionally motivated to maximize the quality of their representation.

Personalization

One of the areas in which the politician establishment is said to have internalized the *media logic* of elections is in personalization. Research in the United States has revealed a shift in political coverage from the legislature to the president, and similar moves toward personalization have been found in the election of coverage of countries such as Finland, the United Kingdom, and Sweden. Even at the local level, studies of public service broadcasting in South Africa, for example, show how election coverage emphasizes personalization and conflict over differences in issues and policy.

Personalization played a significant part in the media coverage of the 2019 UK General Election. The Conservative Party leader—and election victor—was routinely designated by the given name “Boris” in place of the more conventional “Boris Johnson” or formalized “Mr. Johnson.” Such conspicuous informality, which was more marked in print and social than broadcast media, was also apparent in the language used in newspapers to discuss the election and convey results. In its iconic results-day front page, the *Daily Mail* newspaper led with a declarative in their headline “REJOICE! BORIS SURGES TO LANDSLIDE WIN,” whereas the *Sun* newspaper invoked an item of popular slang with “THE DOG’S BOLLOX” (a mildly taboo colloquial term invoking a male dog’s testicles as markers of excellence).

This use of informality is consistent with an additional factor running in parallel with mediatization in the increase of personalization in election coverage: the rise of populist politics. Populism engenders a media logic that acclaims the individual *political outsider* as representing the interests of ordinary people against the political elites and their conventional party structures. Indeed, studies of Israeli elections show how a breakdown and sense of disillusionment in the conventional party system encourages an emphasis on the charisma of the renegade antipolitical outsider. Yet, in introducing this dynamic between political populism and media logic, it is apparent that even at election time, journalistic expression submits to

prevailing public sentiments, even while seeking to influence them.

Citing what Pippa Norris (2000) calls the *virtuous cycle*, it may be that the attractiveness of personality politics can be exploited by both politicians and journalists in order to maximize interest. While exceptions such as Donald Trump in the United States and Silvio Berlusconi in Italy occasionally emerge, other impediments to compelling international election coverage, such as the disalignment with conventional state boundaries, are only partiality resolved by personalization. For example, and drawing again upon the difficulties of covering elections to the European Union, research has found that an increased emphasis on personalization will only enliven coverage when offered in parallel with a coherent set of political programs, combined with the clear prospects for the substantial leadership normally associated with presidential or national elections.

The Contest

A second aspect of the mediatization of election coverage is an undue emphasis placed on its status as a competition, and the metaphors that are mobilized to do this. This manner of placing stress on the competitive element of the election is an example of what discourse analysts call *intertextuality*, where election coverage draws upon concepts and tropes associated with other linguistic fields. The terrain from which these metaphorical tropes emerge is that of the competitive game, with all the associations of distraction and winning-for-its-own-sake this invokes. The assumption that politics is a contest also emphasizes the fortunes and machinations of the individual, which enables the form of election personalization identified in the previous subsection.

However, there are implications for the view of politics as contest, beyond an emphasis on the individuals involved. The contest metaphor most associated with election coverage is that of the *horse-race* (Patterson, 2016). The horse-race metaphor reduces the complex endeavors of politics and government to immediate success, narrated in the lexicon of pace and stamina, with finishing lines producing straightforward divisions between winners and

losers. The dominance of the horse-race frame varies across national settings, although it has broadly increased in incidence over recent decades. For example, Stephen Cushion and Richard Thomas (2018) describe a sustained use of horse-race metaphors in Danish election coverage and identify a marked increase in its incidence in Germany. Even Sweden, which makes less use of the horse-race metaphor than the United States, was still found to use this and related competitive tropes in more than half the programs surveyed.

The broadcast spectacle of election night itself also fully incorporates these discourses of competition. Studying election night programming across Germany and the United Kingdom as well as the United States, Rut Scheithauer (2007) reports the rich use of metaphors of contest, extending beyond sports into the language of conflict and warfare. As a television event, election night routinely foregrounds the innovative use of visuals, latterly digitally generated, with the anticipation of ongoing results nourished by moveable displays such as the UK BBC's "Swingometer" (a graphic device for visualizing emerging results first used in an analogue form in 1955). The election night production heightens its sense of topicality and urgency by exploiting recognizable genres from current affairs, talent contests, and game shows. Raimund Schieß (2007) writes that the visual presentation of election night broadcasts combine nods to popular culture with playful self-reference, allied with the transition rituals, interactive audience address styles, and the energizing chaos of the unscripted live broadcast.

Yet, in common with personalization, political conditions that intensify the use of a competitive frame can be identified. A large-scale study by Susan Banducci and Chris Hanretty (2014) compared print and broadcast outlets across Europe and suggested that the competitive element would tend to be a more prominent component of the election coverage when the main party or individual protagonists were ideologically polarized. Other factors that increase the likelihood of a sustained use of the competitive frame include an uncertainty of outcome that can be used to generate suspense as well as the broader context of an established, resource-rich, and internally competitive news industry.

The Misuse and Opportunities of The Public Voice

A final common resource for election coverage across national contexts is the validating rhetoric of *the public voice*. Research by Cushion into the 2017 UK General Election reveals that such voices are beginning to occupy more broadcast time than the words of politicians. Moreover, the editorial construction of these public contributions reflects the “preconceived narratives of journalists” rather than providing an unsullied reflection of ordinary sentiment (Cushion, 2018). An increasing mediation of election coverage through vox pops, public participation segments, and routine references to “the attitude of the public” (Higgins, 2018) across national boundaries seems to add weight to Strömbäck’s (2009) dismissal of the media’s use of election-related polls as more *vox media* than *vox populi*.

The input of social media has quickened the relationship between media and public opinion in election coverage and occasioned a “subjective turn” in much election coverage. The capriciousness of individual reactions among the watching audience can offer the spice of unpredictability to a political discussion and has been harnessed to most vivid effect in the use of a live graphic representation to plot the developing responses of a chosen panel of voters in broadcast election debates. This *reactor* or *worm* graphic was first used in the 1993 election debates in Australia, and the controversy that accompanies its comparatively rare appearance across several national contexts since then reveals deep misgivings about whether the emotive symbolism of public input should be moderated by journalists who have the responsibility to gate-keep and interpret.

As matters stand, the impetus to include more public voices is driven by the shift of broadcast and print to less formal, elite-driven content, and the participatory essence of social media. In terms of setting the terms of campaign agendas and the tone of coverage, the importance of online *opinion leaders* has become an orthodoxy and is allied with social media’s prominence in providing election coverage with an ongoing stream of public comment. At the same time, digital spaces extend the international scope of election coverage by usurping the conventional state boundaries within

which elections continue to be contested, enabling both professionals and the public access to democratize and internationalize production and consumption.

Final Thoughts

In looking, therefore, to how the role of journalists is evolving in elections, it has become apparent that developments in election coverage will increasingly harness advances in technological affordance and use these to participate in broader shifts toward visible audience engagement. A fuller understanding of these professional practices worldwide will enable journalists to make informed decisions on the available means to popularize content and the consequences of these choices for democratic culture: assisting in the construction of a personality politics informed by such traits as individual integrity, mobilizing a language of mutual dialogue alongside one of contest, using public input to diversify and vitalize election coverage. The further consequence of these developments is that the boundaries within which elections are contested as a democratic ritual occupy a decreasing space within the election’s greater communicative realm. While it remains crucial that journalists sustain a bardic tradition of offering actionable advice in the public sphere, there are emerging imperatives to situate election coverage within this international dimension; positioning localized issues within an international environment and developing the journalistic voice to infuse the local with a concern for the global.

ELECTION COVERAGE, U.S.

Journalism in the United States is frequently discussed in terms of its relationship with democracy. This presumes a particular role for the press in the democratic process, principally the idea (or ideal) that journalism helps citizens navigate their way through a complex world and gives them the information they need to make informed decisions at the ballot box. This democratic role, then, finds its most literal expression in an election, where journalists are called to cover the democratic process in action. This entry discusses the expectations the public has of journalists regarding election coverage (i.e., what journalists *ought* to do) and some of the problems that have been identified in that coverage (i.e., what journalists *do*). It also looks at possible explanations for why there appears to be a gap between expectation and practice.

Why Election Coverage Matters

It is no overstatement to say that it would be effectively impossible to imagine a representative democracy without news media. Journalists connect citizen to citizen and elector to elected. The public become aware of the behaviors of their elected officials, and politicians become aware of the preferences of their electors.

Campaign coverage is important because it is the most literal manifestation of journalism's democratic role. Although democracy is about more than just electoral outcomes, the processes that lead to citizens' expressions of political preference are at its essence. Political decision-making does not occur in a vacuum, for there must be mechanisms that connect the citizen to the world beyond his or her direct experience. This is where journalism plays an essential connective role, providing the means for citizens to learn about the different candidates and their platforms and to debate issues with one another. The theory of agenda setting holds that journalism is effective at setting the public agenda—that is, while journalism might not shape what citizens think, it can shape what they think about. This kind of priority-setting means that journalism's role in elections and campaigns warrants discussion.

Of course, journalism is not the only intermediary between the citizen and the wider society. Family, faith groups, civic and labor organizations, and workplaces may also play a role. Social media also provides members of the public with the tools to connect with the world beyond direct experience (though research also suggests it confines them to ideological silos rather than connecting them to ideological diversity). There has been ample research and commentary that has testified to the decline of traditional journalism's gatekeeping power—that is, the ability to set the public agenda. The positives of these changes—the access that citizens have to multitudes of information at their fingertips—are balanced against (and, some would argue, outweighed by) the growing role of misinformation in the information ecosystem.

Nonetheless, journalism retains a major role in these processes. Moreover, because of the longstanding expectations of the work journalists do in a democracy, it invites ample “ought” questions about how exactly journalists ought to go about covering elections and campaigns. It prompts us to ask questions about how journalists ought to serve citizens in the context of an election and how well, in fact, they perform that service.

The Public's Expectations

Perhaps surprisingly, there is little work done on the expectations of journalists in election coverage specifically. There is, however, a much larger body of work on journalism's role in democracy generally, from which specific expectations can be derived.

Journalism and democracy can be said to be partners in a social contract where press freedom and the independence of media from the state are guaranteed in return for the fulfilment of democratic needs like the free flow of information and a watchdog that can summon attention to abuses of power. For their part of this social contract, journalists ensure that citizens are able to self-govern. Their indispensable place at the heart of the political process grants journalists the legitimacy to cast themselves in the role of arbiter of what is true and factual.

Journalism's Democratic Functions

In his 2008 book *Why Democracies Need an Unlovable Press*, historian and sociologist Michael Schudson identifies seven core functions that journalists fulfill in service of democracy. His list is an ideal place to begin this discussion and apply general democracy-serving obligations to the particulars of election coverage.

First, Schudson says that journalists *provide information*. This is the essence of journalistic work, answering the “who,” “what,” “when,” “where,” and “how” questions pertaining to a given topic. In the context of election coverage, journalists provide the information that citizens need to make prudent political choices and the information about the process, such as where and when voting will be held. Journalists play an important vetting role in ensuring that the information that reaches the public is factual and verifiable.

Second, journalists *investigate*. If a public figure could be abusing their position for their own ends, we would expect journalists to ferret out such wrongdoing. In theory, the exposure allows the democratic process to self-correct as citizens remove malfeasant officials and replace them with ethical ones. This is the essence of journalism as a watchdog, and like the literal watchdog, journalists serve democracy not only by rooting out problems when they happen but also by surveilling the landscape for future threats. Thus, the potential of exposure ought to serve as a deterrent for future wayward candidates.

Third, journalists *analyze*. What might be the implications for the public for a candidate's tax policy? This aspect of journalism provides the wider context behind the headlines. The genre of explanatory journalism, pioneered by digital news organizations like *Vox*, is dedicated to this type of journalistic work, but it has long been a staple of traditional journalism in the form of features and columns.

Fourth, journalists *provide the means for social empathy*. Here, journalism serves a bridging function connecting one part of a community, particularly in the context of connecting the advantaged with the disadvantaged. In this fashion, journalists connect private lives to public issues, through profiles of struggle and hardship. In an electoral context, such journalism emphasizes the human

element of the issues at stake. Drug policy is thus transformed from an abstract issue into a concrete matter of human concern. A candidate's stance on Social Security is covered through the lens of its material impact on the well-being of senior citizens.

Fifth, journalists *facilitate a public forum*. Best illustrated by the opinion section of a newspaper, this function obliges journalism to serve as a common carrier for all manner of perspectives on all manner of issues, such that they provide fodder for public discussion on issues of importance. This emphasizes that journalism doesn't just provide the news but perspectives on the news (traditionally and ideally, the two are kept separate). Such journalism demonstrates the need for interaction and conversation among members of the public and gives them the tools to do so.

Sixth, journalists *mobilize political actors*. In this context, journalists provide the means for partisans to engage motivated communities. Journalism thus helps rally members of the public to take up issues in the electoral process. This function is most commonly associated with the partisan (that is, nonobjective) press, in magazines like *National Review* and the *American Conservative* (on the right) and the *New Republic* and *Jacobin* (on the left). Although its norms are often quite different to the journalistic mainstream, such journalism fulfills an important role.

Finally, Schudson says that journalists are called to *publicize the values of liberal democracy*. This casts journalists as guardians of the democratic process more generally and the norms that uphold it. It may oblige journalists to speak out if those norms are not upheld or if there is a threat to speech or press freedoms on the horizon.

It is important to note that the aforementioned list is not presented in dichotomous fashion. A single work of journalism may fulfill multiple functions. A typical newspaper or magazine may contain content that meets many. The main takeaway from this is that journalism has several, varied responsibilities to the democratic process.

Models of Democracy and Their Demands on Journalism

Another way of thinking about journalism's electoral responsibilities is to reflect on what is

meant by democracy itself. There are, of course, common features to any definition of democracy—free and fair elections, full adult enfranchisement where every vote is counted and equal, the guarantee of speech and press freedoms, for instance—but precise definitions of democracy can vary. Put another way, if you were asked what constitutes a *good* democracy, what would you say? One where elections are competitive with a range of choices, emphasizing the clash of ideas and visions? One where citizens participate in public life? One where citizens can deliberate thoughtfully and have high-quality dialogue?

Such discussions proceed from the assumption that when one cries foul that journalists have done something to damage democracy, one rarely specifies the standard that journalists are alleged to have fallen short of. As political theorists have emphasized, there is no single model of democracy but rather multiple models that place emphasis on different democratic *goods*. It follows that these differing models impose differing expectations on journalism toward their realization.

In his 2005 essay, "In search of a standard: Four models of democracy and their normative implications for journalism," the political communication scholar Jesper Strömbäck identifies four principal models of democracy, each with their own set of *oughts* for journalism—that is, the obligations journalists are called to bear in service of that vision of democracy:

Procedural democracy emphasizes the role of free and fair elections and the respect for democratic procedures (e.g., the protection of civil liberties). It calls for a journalism that respects those procedures and serves as a watchdog to prevent those procedures from being breached.

Competitive democracy emphasizes the clash of ideas in a contest for votes, calling for a journalism that can explore and compare the various candidates' platforms and allow voters to make informed and thoughtful choices about who should hold elective office.

Participatory democracy affords great importance to civic participation and the investment of citizens in public life. A robust and high-quality democracy, for advocates of this model, is one where citizens are politically motivated and participate in public life both outside and within political parties. This vision

of democracy calls for a journalism that mobilizes citizens to participate in public life, giving them the tools to engage with the issues at hand in their community.

Deliberative democracy emphasizes the importance of thoughtful, intellectually honest dialogue in the search for political consensus. It calls for a citizenry that is motivated toward understanding and compromise and a journalism that fosters discussions that are rational, impartial, and intellectually honest.

These are not the only models of democracy mapped out by political theorists, but they do illustrate the different ways that journalism serves the democratic process. The point here is not to overcomplicate matters but simply to emphasize that journalism's obligations in the context of elections are manifold. Proceeding from the assumption that journalism serves democracy in multiple and intersecting ways, and thus ought to be held to high standards, the extent to which journalists meet those standards is the subject of the next section.

Journalism and the Public's Expectations

A prevailing concern about election coverage is the predominance of the *game frame* or *horse race* style of reporting. This mode of journalism emphasizes the strategies of the different campaigns at the expense of substantive coverage of the issues at stake in a given election. It is centered on process and personality and their inevitable result: polls. According to political scientist Thomas E. Patterson and others, campaign coverage shifted away from a traditional issue-based approach to a more game-oriented approach in the second half of the 20th century, a change he attributes to the growing professionalization of politics and political messaging and, in tandem, the rise of television and its emphasis on visual storytelling.

Polls and Pundits

The use of polls has grown exponentially since at least the 1980s, with no apparent sign of letting up. Indeed, the ever-growing prominence of polls may be the defining characteristic of late 20th-century political coverage. Although polls have a long history, both their exhaustive use and the

sheer number of polls and polling companies is a much newer phenomenon. A doubly problematic trend is the use of polls for forecasting, putting journalists into a predictive role that traditionally they have not occupied and lack the specialized knowledge to perform. The accuracy of polls in the 2012 and 2016 presidential elections has been called into question, though it might be more apt to lay the blame on a failure of interpretation on the part of news organizations.

Polls are an important reflection of public opinion, and one of the roles that journalism fulfills, as noted earlier, is to provide that reflection so that those who hold or seek elected office can be aware of the sentiments of their electorate. The problem is chiefly one of proportion (i.e., the sheer number of polls and their bearing on the overall composition of campaign coverage) and of interpretation (i.e., the efficacy with which they can be analyzed, explained, and weighted against other evidence).

Who is up and down in the polls represents the convergence of journalism with entertainment, through the use of a dramatic narrative about who may ultimately claim victory and their setbacks on that path. Small changes in polls that may lie within the margin of error are reported as though they possess earth-shattering ramifications.

The rise of cable news has also allowed for pundit-driven coverage, where substantive issue coverage (i.e., actual reporting) is replaced by panel discussions among partisans. If the various models of democracy discussed earlier call for a journalism that generates light (the deliberative model particularly), pundit-driven news fails that test and instead generates only heat. It is difficult to sustain the argument that such journalism, if indeed it can be called that, serves the public interest. This is not to say that opinion and analysis ought to play no role—indeed, the participatory and deliberative models of democracy and Schudson's analytical and public forum functions of journalism may *demand* such journalism—but rather note that this kind of coverage does not help citizens engage with the issues. Thoughtful discourse that illuminates partisan distinctions ought to be welcome in campaign coverage but talk for talk's sake (or, worse, conflict for conflict's sake) should not be.

Consequences

Overall, these tendencies treat politics as a game, as sport, or as spectacle rather than a serious process affecting the lives of the polity. The predictable and regrettable consequence of this means that issue and policy coverage tends to draw the short straw as more time and space is afforded to coverage of the game itself and its various personalities. Democracy is reduced to who crosses the finish line rather than the consequences for the wider public. Fitness for office becomes secondary to the ability to win. Issue coverage is dwarfed by the game frame.

These tendencies have been linked to growing cynicism among members of the electorate toward the political process, facilitating their disengagement from politics—manifested most literally (and perhaps consequentially) in declining voter turnout at elections. Other scholarship has emphasized the role of process and personality in mobilizing political engagement and bringing less politically engaged people into the conversation due to the excitement generated by coverage. The relationship between game-framing and political participation has, then, yielded mixed results in the research.

Debates

Questions have also been asked about the role of the news media in the candidate debates that have become a centerpiece of election coverage. What candidates are and are not invited, how much time each candidate gets to speak, and what kinds of questions they are asked have all provided much discussion fodder. There have also been more fundamental questions asked about the role of the journalist in these processes. Are they to serve as a moderator and allow candidates to fact-check one another, or are they there to serve as a journalist and provide real-time fact-checking for the viewing audience? CNN's former chief political correspondent Candy Crowley was the subject of controversy in 2012 when she corrected former Massachusetts Governor Mitt Romney's assertion that President Barack Obama did not refer to the 2012 attack on the U.S. Consulate in Benghazi, Libya as an *act of terror*. Because the ethical responsibilities of debate moderators have

been insufficiently mapped out, it remains an open question as to how interventionist journalists should be in these roles.

The Gap Between Ideals and Realities

Journalism is not produced in a vacuum; a hierarchy of influences from the social system to the characteristics of the individual journalist ultimately shapes journalistic output, to varying degrees. This means that the convenient fiction of the lone, autonomous, and empowered journalist needs to be set aside in favor of a more complex understanding of the forces that shape news production, some of which wrest agency away from the journalist.

Horse-race reporting and its attendant ills prevail because it is cheap and easy to produce. It does not require time-consuming and expensive investigation or any specialized knowledge to be brought to bear toward analysis. Research indicates that journalists perceive it is of interest to news consumers, though we should not confuse the public interest with what the public may be interested in and, more fundamentally, should not fall into the trap of thinking that demand determines supply—audiences can only choose from the options made available to them and tastes are cultivated over time.

It is also important to note that these problems persist because they allow journalists to present themselves as *above the fray* and thus adhere to the objectivity norm. Issue-based coverage that might illuminate facets of a candidate's platform that they would rather not be the focus of substantive coverage can leave a reporter prone to accusations of partiality. Far easier and safer, then, to focus on the game itself. This is a perhaps cynical read of journalistic intention, and it would be inapt to say that journalists are motivated by fear in this regard. It does, however, speak to the purchase that objectivity possesses as a central journalistic norm in the United States. In this regard, objectivity is used as a shield to ward off criticisms of subjectivity. Polls, with their social scientific basis, are a convenient tool in this effort.

Also to be noted here is the role of *pack journalism*, which refers to a herd mentality among journalists reproducing one another's norms and routines on the campaign trail. Journalists

spending time with other journalists may develop shared expectations about what their journalism ought to look like. This mutually reinforcing relationship (both among journalists and between journalists and those they are covering) was famously documented by *Rolling Stone* reporter Timothy Crouse's coverage of the Nixon and McGovern campaigns in the 1972 presidential election, reporting that ultimately became his book *The Boys on the Bus*.

Looking beyond journalists themselves, we should also look at the commercial logic underpinning U.S. journalism. Unlike many other democracies whose media systems are characterized by substantial funding of journalism from the public purse, journalism in the United States resides almost entirely in the commercial sector, sustained by advertising. Researchers have documented the grievous consequences of commercial logics applied to journalism, as what may attract eyeballs (and thus advertiser dollars) is not necessarily material that will enrich public understanding. It also bears noting that the slow collapse of the advertising-based revenue model means that journalists are increasingly having to do more with less, which feeds the vicious cycle above where horse race coverage becomes the cheap default.

There is also the role of technology. From television to cable to social media, successive technological innovations have altered the chemistry of the media landscape and increasingly accelerated the pace of news delivery and the need to fill content. Television allowed for a more interpretive style of journalism to emerge and placed greater emphasis on the visuals of political theater. The Internet has allowed for an explosion of new voices into the marketplace of ideas, while social media sites like Twitter allow for a completely elastic news cycle untethered to traditional production schedules (e.g., the printed edition of the newspaper or the nightly television newscast) and contemporaneous to the news itself.

Journalists are aware of the problems with their election coverage. In a study of journalistic self-critique following the 2000, 2004, 2008, 2012, and 2016 presidential elections, Elizabeth Bent, Kimberly Kelling, and Ryan J. Thomas demonstrated how the same postelection recurs conversation in press criticism about overreliance

on polling, failing to represent critical segments of the electorate, or relying on the coverage of other news organizations. That this conversation recurs indicates that there is awareness of the problems but the inability or unwillingness to resolve them.

Contemporary Challenges

The difficult role that journalists play in elections is compounded by the sheer amount of misinformation and disinformation—or *fake news*, as it has come to be dubbed—circulating online. Journalism's waning economic foundation and hold over the gatekeeping process have come at an acutely inopportune time, given the ability for bad actors (from individuals to states) to pollute the information ecosystem with unreliable information that could ultimately have electoral consequences. Each model of democracy has, at bottom, the necessity of an informed electorate (they differ in the demands they place on citizens about the constancy of that informed state). A misinformed electorate, then, has dangerous democratic consequences. Although U.S. politics has long been awash with conspiracy theories—the historian Richard J. Hofstadter's 1964 essay "The Paranoid Style in American Politics" comes to mind—the danger now lies in the sheer scale of misinformation enabled by social media.

On the topic of misinformation, it is also worth noting the difficulties journalists have encountered in covering then-candidate and ultimately President Donald J. Trump. Fact-checking as a distinct genre of journalism—where a specific claim is checked and its facticity scored (e.g., *The Washington Post* is famous for its use of Pinocchio)—emerged in the early 21st century as a novel way of testing the veracity of candidate statements. The sheer amount of misinformation pumped out by Trump has made it difficult for journalists to keep up, raising the question of its potency in activating public concern. The journalistic tendency in election coverage to endeavor to balance one's output (i.e., a critique of one candidate must be balanced by a critique of their opponent) works against the public interest when there is a demonstrably clear imbalance in truthfulness across candidates.

This is fueled by yet another challenge to journalism's electoral role—growing political polarization and distrust of the news media as an institution. Realizing the journalistic functions that Schudson enumerates and meeting the journalistic obligations imposed by the models of democracy Strömbäck identifies is a difficult task when substantial portions of the electorate do not trust what journalists have to say and thus do not rely on them to inform their political choices. Partisan media has abetted this. Although trust surveys should not be dismissed outright, they can be approached with the understanding that the declining trust in journalism is not uniquely journalism's fault, nor is it uniquely journalism's problem to resolve.

EMBEDDED REPORTERS

Media–military relations in America have been fraught since the Revolutionary War. The symbiotic relationship that defines the press–government relationship generally applies to the battlefield, with journalists needing access to stories of combat for commercial and professional reasons, and policymakers and military officials needing favorable coverage to marshal public opinion in support of war and counter enemy misinformation. The post–9/11 invasions of Afghanistan and, especially, Iraq introduced a new model of media management from the Pentagon known as *embedding*, in which reporters were assigned to specific units on the condition that they adhered to a code of conduct that outlined the parameters of what could and could not be included in stories. As the wars in those countries turned into occupations and counterinsurgencies, embedding evolved into more of an ad hoc system in which journalists would request to accompany units on a mission-by-mission basis, though still operating under a code that itself went through several controversial modifications reflecting growing tensions between the military and the media. The story of embedded reporters is one grounded in American principles of freedom of the press, mythological narratives about its past victories and defeats, unique challenges brought on by the wars against terrorist groups and their allies, and the ever-present

tension between a media trying to inform and a military waging information warfare. This entry describes and analyzes the embedding program as it evolved over 20 years of warfare, with an eye toward what this evolution in conflict journalism can tell people about media–military relations and the role and function of the media in wartime.

History of Reporting in U.S. Wars

In one form or another, reporters were embedded with troops on the front lines through the Vietnam War in what can be termed a *post-censorship* media management model. In this system, the military allows journalists on the battlefield but reviews and edits their stories. From World War I through the Korean War, this often took the form of propagandistic revisions, excising any information deemed overly critical or which did not support the myth of fearless, super-hero GIs outfitted with the best equipment. During the two World Wars, it also meant a near total ban on images of dead Americans. America's defeat in the Vietnam War—a “living room war” broadcast in vivid color on the nightly news and reported by correspondents able to hop on military helicopters to the front at virtually any time—led some in the military and government to believe that an unrestricted media played a major role in the United States losing the war by destroying public morale and sapping policymakers of the political will to do what it took to win the war. This opinion was based largely on several myths that studies show were unfounded (e.g., that coverage was always critical and casualty-laden, neither of which were true), yet this conventional wisdom in military circles made many look for ways to better control the media during wartime.

The 1982 British war against Argentina in the Falkland Islands introduced a new, *pre-censorship* model of press management. In an unprecedented move, the British only allowed a few journalists to accompany the invasion, relegating the rest of the reporters to military press conferences held on the ships. American military planners duplicated this approach when a Marxist coup occurred on the Caribbean island of Grenada in 1983. Military spokespeople during the invasion made it look like a stunning, unmitigated success story, yet later Congressional hearings revealed that in fact these

press briefings had included misinformation and falsehoods. The Pentagon employed this more restrictive model of media control on a massive scale during the Persian Gulf War, instituting a pool system in which a rotating handful of reporters would be allowed to accompany troops on carefully choreographed outings, while the rest would be stuck covering press briefings from hotels in Saudi Arabia. News organizations complained that they were being censored. When critics blamed the press for presenting a sanitized, casualty-free view of the war, journalists would defend themselves by saying they were not allowed enough access to show those stories and images. In the end, though, pre-censorship led to glowing coverage and a public relations victory for the Pentagon.

Following the Persian Gulf War, government and military officials made noises about adopting new guidelines. The 1997 *Army Field Manual's* section on public affairs encouraged officers to offer journalists the opportunity to spend concentrated time with military units during operations, governed by a set of ground rules whose only restrictions on coverage would involve matters of operational security. Yet whatever the media and others thought of the various pre-censorship models, they had been an unqualified success from the government and military perspectives in terms of message control. Furthermore, there had not been any blowback from the public, which ate up the highly managed, patriotic stories coming out of easy victories in Grenada, Panama, and Kuwait. For the military, pre-censorship worked.

Post-9/11 Wars and the Birth of the Embedding Program

Following 9/11, the United States found itself in the unprecedented situation of fighting two wars simultaneously. Many assumed the military would revert to the pool system it had used successfully, if controversially, in Kuwait. Three senior Pentagon officials—Defense Secretary Donald Rumsfeld, Deputy Assistant Secretary of Defense for Public Affairs Bryan Whitman, and Assistant Secretary of Defense for Public Affairs Victoria Clarke—thought otherwise. They decided it would be better if audiences back home had a front-row seat to the war and knew that Americans would

be riveted by these stories. They also recognized that early in a conflict, reporters could be expected to produce largely positive stories, as they had at the beginning of every previous American war. Embedding reporters with units would also make it easy to generate human interest stories about brave GIs, stories that were certainly legitimate news, but also great public relations.

Officials also saw the embedding program as the best way to ensure the safety of the journalists themselves. This was not Vietnam, where reporters could head down to the base's airfield and hitch a ride on a helicopter heading to the front. Reporters driving on their own risked getting lost, or worse, being killed at long range by U.S. troops unsure of whether the cars approaching them were friendly or hostile.

But perhaps the most important reason Pentagon officials needed the embedding program, even if they would only partially admit to it, involved the United States' weakened position globally in waging information warfare against Saddam Hussein. Officials knew based on the experience of the Persian Gulf War that Saddam and his spokespeople would spread misinformation about how Iraq was winning the war. Indeed, when he announced the embedding program in October 2002, Rumsfeld pointed out that in Afghanistan the Taliban and al Qaeda had also been effective at managing the news environment. In normal times, the United States would not need to worry about a he said-she said confrontation with a brutal dictator such as Saddam. Yet these were not normal times. Most of the good will and credibility that the United States had built up globally following the 9/11 attacks had disappeared with the plan to invade Iraq, which strong majorities in virtually every major country thought was illegal and imperialistic. Even Americans were divided about the invasion. Embedding, however, allowed for independent journalists to report the truth instead of taking U.S. officials' word. In another smart stroke of strategic thinking, the Pentagon opened 25% of the embedding slots to reporters from around the world, including countries and media seen as hostile to the American invasion, such as French news organizations and Al Jazeera. Embedding became a way of saying, "We have nothing to hide."

The Department of Defense ended up making more than 900 embed positions available to news organizations. About 775 reporters from more than 250 media organizations were submitted. Ten percent of the spots were made available to local news outlets in communities with large military concentrations. Numbers vary, but between 550 and about 700 reporters ended up being embedded during the invasion.

Embedded reporters would be assigned to a unit and agree ahead of time to ground rules concerning media and military responsibilities (e.g., the military would protect reporters, news organizations would purchase their own protective equipment), and coverage. These guidelines, outlined in the Department of Defense's *Embedment Manual*, explicitly stated that media access would be minimally restrictive, that commanders would allow journalists to observe combat operations, and that all interviews with service members were assumed to be on the record. Perhaps most importantly, given the history of the military's propagandistic editing of media stories in past wars, the policy stated, "there is no general review process for media products" (Katovsky & Carlson, 2003, p. 407). In other words, no censorship. In case this was not clear enough, the policy said explicitly, "These ground rules recognize the right of the media to cover military operations and are in no way intended to prevent release of derogatory, embarrassing, negative, or uncomplimentary information" (p. 408). At the same time, the rules went into great detail about what could *not* be included in stories, but these restrictions revolved entirely around operational security concerns.

Embedding Evolves

Although the embed program marked a welcome change from the pre-censorship era of wartime media management, it was no panacea and faced many criticisms, challenges, and controversies. First among these involved complaints by many journalists and critics that by embedding reporters in a tightly controlled context that restricted their view and access to the larger war, the program essentially left the media "in bed" with, or too close to be objective about, the military, rather than independent from it. Media organizations

and reporters were not required to participate in the embed program, and many chose not to.

Perhaps the most obvious challenge to the embed program itself involved the security of the journalists, and by extension, the troops tasked with keeping them safe in the middle of battle. Over the course of the wars in Afghanistan and Iraq, several embedded reporters have been injured and some killed.

One outcome of the rapid decline in the security situations in Afghanistan and Iraq was the return of a variation on embedding. Every war is unique, but one of the novel, defining characteristics of the post-9/11 wars is that journalists themselves have often been targets, with many kidnapped and, in several highly publicized instances, executed on camera. In the 21st century, a press pass is no longer a protective shield.

Hence, following a few halcyon months of unfettered access and reporting, embedding returned as a means for reporters to safely visit the front lines, accompany troops on operations, and in the most dangerous environments find safe living conditions on military bases and protected “green zones.” This coincided, though, with more negative coverage that reflected the rising insurgencies, government corruption, and general hopelessness in each theater. This change in media tone resurfaced long-held frictions with many in the military who were predisposed to seeing reporters as biased against them. As a result, in some cases, embedding ground rules, which had been left largely up to local commanders, became more restrictive and more censorious.

In 2007, for instance, the Pentagon began requiring that reporters planning on going on an embed get signatures or consent from troops before using their images or voices in pictures, video, or audio recordings. Journalists complained that these new restrictions were simply attempts to block negative reporting.

In 2009, the U.S. regional command in eastern Afghanistan went a step further and banned the publication of any videotape or photograph of soldiers killed in action. This despite already agreed-upon rules going back decades that no identifying information would be used about a seriously wounded or killed GI until their family had been notified. This followed a controversy over the Associated Press publishing a series of

pictures that showed a Marine who had been mortally wounded by a rocket-propelled grenade in Afghanistan. The Marine’s family had already been notified of his death, but many still found the picture distasteful, including Defense Secretary Robert Gates, who called it appalling.

Around the same time, stories revealed that the Pentagon had hired an outside consulting group to vet reporters applying for embedding assignments in terms of whether their past work was positive, neutral, or negative. Some journalists claimed that they were denied embeds based on the ratings.

In 2015, the Pentagon released a revised *Law of War Manual* that took a much more aggressive stance toward embeds, saying that some journalists might be treated as *unprivileged belligerents*, a term that legally means one is below a civilian in terms of rights and protections. This raised the specter of reporters being detained as possible spies or even having their personal safety put at risk. Critics in the media and elsewhere expressed concern that the new guidelines would empower local commanders to punish, perhaps even with imprisonment, reporters whose stories they did not like.

Views From the Military, Media, and Scholars

Military reviews of the program (most from the early years of the wars in Afghanistan and Iraq) have been largely positive. Many point to the program’s ability to give audiences at home, including military families, a view of the war and those fighting in it they would otherwise not have. At least at first, it was seen as improving military-media relations, though surveys showed a lingering distrust among military respondents of journalists’ motivations and biases. The 2008 *Army Field Manual* 3.0 described the embedding program as a “force multiplier,” capable of building morale among troops and home audiences. In particular, embedding has been described by the Pentagon as a key tactic in information warfare, especially in countering disinformation and misinformation from the enemy. In sum, the program is seen by many in the military as one of the most important tools for increasing public support for the military and the war, while simultaneously

countering enemy propaganda and controlling the information environment.

The view from the media, as one might imagine, is more nuanced. Some embeds have said that at least early on they did not feel restricted in what they could cover or how they could cover it, and felt military officials provided more help than hindrance. Certainly, as the security situations in each country deteriorated, the program became an essential means for covering the wars. As discussed, however, many journalists rejected the program in its inception on principle, and continued to complain that embedded reporting produced myopic, even propagandistic stories. Many felt that reporters became too close to the troops they covered, some even accusing them of succumbing to Stockholm Syndrome, which refers to the psychological phenomenon whereby hostages and kidnap victims sometimes develop sympathy for their captors. Perhaps the most common objection was that embedded reporters missed out on local stories, especially during the invasion phases of the wars, or when they were limited to living in secure zones.

Scholars have examined these issues in several studies of embedded coverage, most of them looking at the invasion period of the Iraq War. For the most part, these studies have shown that coverage by embeds did, in fact, have a narrow, military-centric focus, especially compared to coverage from unilaterals, who ran more stories about local concerns and life. Research also generally confirms the assumption that embedded coverage is largely positive, with a tendency to focus on battle and soldier-specific human interest stories, and reflecting the frames and perspectives of military officials. One study found that embedded reporters were about twice as likely to adopt a tone supportive of the military than were unilaterals. Another found that about nine in 10 embedded reporters' stories featured a quote from a soldier as a source, about twice as frequently as in unembedded reporters' stories. Studies also show that despite no military restrictions on coverage (at least until 2009 and even then not everywhere), the American press almost entirely shied away from showing dead and seriously wounded American GIs. For instance, the *New York Times* reported in 2008 that only about a half

dozen graphic photographs of dead American soldiers had run in news stories.

The relationship between the media and the military in wartime has always been both symbiotic and tense. Journalists' desire for good stories and truth sometimes overlaps with the Pentagon's need for good stories about brave soldiers achieving victory on the battlefield; but at other times defeats, setbacks, and even criminal behavior and mismanagement can put the news at odds with the military's desire for positive news. In the post-9/11 environment, Pentagon officials eschewed the earlier, restrictive pre-censorship model of media control and adopted the embedding program in an effort to allow journalists from around the world to tell the story of the wars in Iraq and Afghanistan through independent eyes. These officials were not naive: They understood that embedding would likely lead to human interest and military-centric stories that would be positive and even patriotic, producing the kind of public morale-boosting effects they sought. They also hoped that journalists' stories would be the most credible means of countering enemy propaganda, and thus would be a key weapon in information warfare. Studies show that on all counts, especially during the early stages of the Iraq War, they were correct. Coverage from embedded reporters, which represented at least two thirds of all reporters in the field early on, reflected military frames and perspectives, focused on GIs and their bravery, countered fanciful attempts at disinformation by enemy propagandists such as Iraq's Minister of Information Mohammed "Baghdad Bob" Saeed al-Sahhaf, and ran mostly positive stories. These biases become all the more evident when comparing the coverage of embeds to that of independent, unilateral reporters untethered to military units, though it is important to note that those reporters' stories were also mostly positive and casualty-free, even if less so.

Following the withdrawal of most U.S. troops from Iraq in 2011 as part of the status of forces agreement between the two countries signed in 2008, the embedding program essentially became retired there. It continued in Afghanistan, though the rules there varied even more than they did within the U.S. military, due to the international nature of the coalition. Importantly, however, in both Iraq and Afghanistan, the U.S. military

presence became increasingly focused on special forces. This trend has had important implications for news coverage of military operations because journalists very rarely are allowed to accompany these operations. Indeed, the growing reliance on waging war using means out of the public view, from special operations to drones, has not only made embedding less relevant, it has made accountability journalism itself more difficult. In some ways, then, one is seeing a return to a de facto form of pre-censorship, in which journalists and the public must rely on the good graces and candor of military and government officials for reliable information.

ÉMIGRÉ NEWS MEDIA

Newsgathering and distribution are considered key functions of the mass media responding to the human need for awareness of surrounding events. This need is further intensified in the course of migration, as immigrants reach a new and unfamiliar environment. Information about events in

the host country indeed flows regularly from media in the host language, but most immigrants cannot avail themselves of it because they have not mastered this language and therefore require their own news sources. Furthermore, the language barrier itself is not the only reason for intensification of the immigrants' need for news in their own language. Another factor derives from the tendency among mainstream news sources to ignore topics that could interest immigrants or at most to provide partial and often distorted coverage of events in their homeland. Accordingly, in most societies hosting massive immigration waves there is seen a flourishing of news media in immigrants' mother tongues aimed at fulfilling their immediate need for orientation regarding the host society as well as satisfying their need to follow updates regarding the country of origin. This entry discusses the principal aspects associated with émigré news media, including their major functions, audience, journalistic practices and working conditions, and the role of these media in the global refugee crisis.

Émigré Media Functions

According to a seminal work of K. Viswanath and Pamela Arora (2000), émigré news media fulfill five main functions that are especially relevant for the newcomers and that might have different consequences regarding immigrants' social and cultural integration versus maintenance of their original ethnic identity and ties with the homeland:

1. *Transmission of the homeland culture* function includes covering news of immigrant community events, such as reports about cultural and religious celebrations, communal meetings, and visits of politicians, artists, and other prominent figures from the homeland.
2. *Informational* function is fulfilled by news items providing information about events occurring in the immigrants' homeland and in the communities of their coethnics dispersed all over the globe.
3. *Community sentinel* is a protective function of émigré news media also known as a *watchdog role*. As immigrants are potentially vulnerable to discrimination, this function is

especially important and is fulfilled by news reports on immigrants' civil rights violations, changes in immigration laws, and crime against immigrants, for example.

4. *Community booster* function can be found in news items that present the immigrant community in a positive light, projecting an image of success, achievement and contribution to the host society or to the native land.
5. *Assimilatory* function facilitates newcomers' social and cultural adaptation by covering news on immigrants' involvement in local politics, and promotion of positive connections between the homeland and the host country.

Furthermore, as noted by Dan Caspi and Nelly Elias (2011) when analyzing émigré news media functions, it is crucial to distinguish between media *for* immigrants (i.e., media established and owned by the hosts) versus media *by* immigrants (i.e., media initiated and owned by the immigrants themselves). Although both types of media use the immigrants' mother tongue, they have different objectives and serve different interests, projecting on the content and the framing of their news reports (see Table 1).

According to Caspi and Elias (2011), this distinction is especially important to analyze the quality of news produced by the immigrants' news sources. First, media-*by* would present their own alternative to the host majority agenda, just as media-*for* would

tend to adopt the host agenda and worldviews and transmit them to the immigrants as well. Second, on one hand, media-*by* would provide an easier access of the immigrant community members to the news production, thus compensating them for the lack of such access to the host media. On the other hand, media-*for* may be more selective in terms of the immigrants' access to the medium, so that preference would be accorded to those community members who do not endanger the host majority's dominance. Finally, media-*by* and media-*for* would differ also in the quality of coverage of the immigrant community's events and way of life. Even though one may expect that both media types aim to compensate the immigrants for their distorted coverage and underrepresentation in the host news sources, it is not uncommon that a paternalistic and one-sided view of the immigrant community would prevail in the media-*for*, as their workers often lack the sensitivity and first-hand familiarity with the immigrants and their culture.

Émigré News Media Audience

As information needs are intensified during the first stages of immigrants' adaptation to the new surroundings, immigrants tend to seek news extensively and are characterized by a high rate of news consumption. Besides news covering events in the homeland, immigrants seek news addressing their immigrant experience in the host country. As such

Table 1 Media-*by* Versus Media-*for*

	<i>Media-for</i>	<i>Media-by</i>
Principal objective	Mostly help immigrants adjust to the host society	Mostly help immigrants preserve their original identity and ties with the homeland
Immigrants' access to the medium	Controlled and limited towards immigrants	Relatively free towards immigrants but limited toward majority
Agenda	Attempt to dictate immigrant community agenda	Attempt to reflect immigrant community agenda
Homeland news coverage	Limited and generally critical	Extensive and generally supportive
Host society news coverage	Extensive and generally supportive	Limited and generally critical

Source: Based on Caspi, D., & Elias, N. (2011). Don't patronize me: Media *by* and *for* minorities. *Ethnic and Racial Studies*, 34(1), 62–82, reprinted by permission of Taylor & Francis Ltd, <http://www.tandfonline.com>.

items can be rarely found in the host media and are often presented in a biased and distorted way, immigrants perceive themselves as excluded from the flow of national news and criticize their depiction therein. This situation often leads to the proliferation of émigré news media aimed at compensating their audience for the perceived injustice. Émigré news media are thus not only an important source of information but also a means of self-expression and alternative representation.

In this regard, the rise in popularity and use of contemporary information and communication technologies (ICTs) has created a new angle for understanding immigrants' information needs. Contemporary media technologies propose new opportunities for migrants, since they serve as a source of alternative information regarding the host society, a tool for social empowerment, and an amplifier for their muted and often unattended voice.

In general, there is a positive association between consumption of news in the immigrants' mother tongue oriented toward the host country and the newcomers' social and cultural adjustment. On the other hand, however, émigré news media may also have an opposite effect if immigrants depend on news sources in their mother tongue for too long. Overemphasis of home country news at the expense of host society events also tends to jeopardize the integration role of émigré news media.

Journalist Practices and Working Conditions of the Émigré News Media

Immigrant journalists employed in the émigré news media may face several major predicaments. These media largely rely on an extremely weak financial infrastructure that dictates their modest professional standards, low wages, small staffs, and poor working conditions. Limited finances and training opportunities often preclude long-term goals, engender understaffing and mandate extensive volunteer work. The smaller dimensions of émigré news media, in turn, entail less division of labor and consequent imposition of diverse functions on each employee.

The combination of staff shortages and a heavy load of journalistic duties typical of émigré news media also results in low professional standards,

as immigrant journalists are mostly tied to the newsroom and use the telephone and online resources rather than engaging in investigative field reporting. Similarly, financial considerations render it difficult for these media to establish their own information gathering sources. Hence, there is a clear preference for "recycled" information acquired from the host news media, even at the expense of timeliness or commitment to the immigrant community's issues. Furthermore, immigrant journalists often lack professional training and proficiency in the host language. The former shortcoming may affect quality of reporting adversely, while the latter engenders an apparent problem with translation from the host language to the immigrants' mother tongue. Finally, the position of immigrant journalists within their own ethnic community may also be precarious. Although émigré news media derive their strength from close contact with their communities, their professional ethics may be compromised by flawed source dependencies and a low professional status.

Émigré News Media and the Global Refugee Crisis

Adaptation and integration of refugees require the ability to access and utilize vital information, much of which is provided over ICTs. Accordingly, Dana Diminescu (2008) suggested the concept of the "connected migrant" to demonstrate the convergence of recent developments in the social, digital, and communicative realms. This concept gains a special power in light of the current global refugee crisis, as millions of victims of genocide, civil wars, and authoritarian regimes—mostly from the Middle East and Africa—seek refuge and shelter in various countries throughout the world.

In this regard, the unique qualities of contemporary ICTs—such as their ability to offer abundant amounts of information; to enable users to design and transform their media environments; and to express themselves using varied creative means—might be especially important for the well-being and place making of forced migrants. It is not surprising, therefore, that current refugees have been defined in the popular media discourse as "Facebook refugees," for whom a

smartphone is the most crucial item they carry during their journey.

Recent studies aimed at examining forced migrants' media uses point to different roles fulfilled by the different media in the refugees' search for a new home and imply that these uses change throughout their resettlement. Saskia Witteborn (2012), for example, found that news searching activities and Facebooking were the main digital practices used by asylum seekers in Germany, which contributed to the forced migrants' well-being and served as a source of hope. Furthermore, Houssein Charmarkeh (2013) found that Somali refugees in France ascribe different roles fulfilled by different media in their search for a new home and imply that these uses change throughout their resettlement. More specifically, Charmarkeh found that social media were strongly linked to refugees' mobility and were mostly used for the purpose of finding a safe refuge, while traditional media (e.g., television, newspapers) served as a window into France and French culture. At the same time while being connected to a contemporary media ecosystem, forced immigrants' access to news as well as to personal information is insecure, unstable, and undependable, leading to potential threats to their well-being.

EMOTION IN JOURNALISM

The relationship between journalism and emotion has always been fraught and never more so than in today's social media environment of fake news and polarized opinion. On the one hand, deeply embedded normative values of Anglo-American journalism that can be traced back to the second half of the 19th century dictate an ideal of detachment, fact-based journalism, and impartiality, concepts often grouped together as an objectivity paradigm. On the other hand, journalism is a contest for attention, and every reporter and editor knows that without raw emotion, readers and viewers will find their stories boring. This is the fundamental tension between journalism and emotion that lies at the heart of the profession.

For much of the 20th century, the objectivity paradigm prevailed and withstood challenges from diverse forms of journalism that tried to push emotion to the fore. But with the advent of social media, the floodgates have been opened and today's journalism is increasingly infused by emotion. The discourse of journalism often still endorses the normative values of detachment and fact-based journalism, and age-old disciplines such as verification have taken on new salience in an age of fake news. But the public now expects to witness the feelings and personalities of journalists and to be able to converse with them on social media platforms. In addition, the incorporation of user-generated content (UGC) into mainstream reporting has become an essential tool for news outlets to engage their audiences and creates a hybrid news file that is perceived to be more authentic than the formulaic approach of old. This hybrid product takes on some of the

characteristics of social media platforms where experiences can be shared, blurring the lines between news and entertainment.

This entry traces how emotion was at first sidelined in the development of journalistic norms and became perceived as a marker of “bad” or sensationalist journalism. It explores the challenges to the objectivity paradigm and how over the first two decades of the 21st-century news has progressively become more openly emotional. It examines the cultural, social, and technological reasons behind this rise and the challenges this poses to today’s journalism.

As this entry explores, emotion has in fact always been central to journalism, but until recently, it has rarely been the topic of discussion among journalists or the subject of detailed academic study. It has tended to be a taboo subject hardly mentioned in the open for fear of being seen to undermine principles of objectivity. Only recently, in the light of today’s social media environment and the overt increase in emotionality, has there begun to be a focus on the subject. Today, the term “emotional turn” is being applied in journalism studies and a growing volume of work can be found exploring the phenomenon. Terms such as “emotional labor,” “emotional intelligence,” and “emotional literacy” are used liberally, together with discussion of issues related to trauma and posttraumatic stress disorder.

Many scholars make a clear distinction between “affect” and “emotion,” although the terms are often contested and sometimes used interchangeably. While there are many different theories of affect, dating back to the “affective turn” in social and cultural studies during the 1990s, it is generally defined as an experience that can be described as noncognitive, nonconscious, nonrepresentational, and immaterial. By contrast, emotion can be seen as the sociological expression of feelings or the interpretation of an affective experience. As such, affect is an umbrella term and a zone of potential emotions before they have been assessed or related to a specific subject or source.

How Emotion Was Sidelined and Derided as Bad Journalism

The suppression of emotion in the discourse surrounding journalism can be traced back to the

mid-to-late 19th century when normative values around objectivity emerged in the news media in the United States and Britain. The exact reasons are contested and have been the subject of extensive scholarly debate, but it is generally seen as resulting from a series of parallel developments in the two countries. This was the age of Charles Darwin, positivism, the primacy of reason over the senses and a growing belief in scientific facts. The founding of news agencies such as the Associated Press and Reuters in the middle of the century coincided with the invention of the telegraph and the emergence of a terse, fact-based news style based on the “Five Ws” (who, what, when, why, where). One of the reasons for this was intensely practical. If the telegraph broke down, the chances were that the most important part of the story, at the top, would arrive intact. The style of the inverted pyramid story became enshrined as an ideal format and one that is taught in journalism schools to this day.

As the new technology of mass printing allowed newspaper barons to increase their circulation and, by extension, potential profits, so stories became politically less partisan to appeal to a wider readership. By the turn of the 20th century, journalists were determined to establish their role as a profession and, crucially, as one that differentiated itself from the emerging discipline of public relations. The growth of propaganda during World War I and the rise of fascism in Europe in the 1930s made journalists even more determined to set themselves apart from those who aimed to manipulate public opinion through the use of emotion. By the 1930s, normative values of journalism comprised detachment, impartiality, balance, and a reliance on facts, an objectivity canon that extended beyond the borders of just the United States and Britain. These values were seen as a marker of the professional journalist, a detached observer who witnessed events. Conversely, emotion was derided and often regarded as synonymous with “bad” or sensationalist journalism. The view can still be heard today in discussion about how media is “dumbing down” or undermining the role of the public sphere to foster rationale debate.

That is not to say that journalists did not and do not use emotion to capture their audiences’ attention. Instinctively, journalists have traditionally employed a “workaround” to ensure they engage

readers and viewers through relaying the feelings of the protagonists and sources that feature in their stories. This technique, known as the “outsourcing” of emotion, allows the journalist to create lively, emotionally rich stories while at the same time upholding the objectivity paradigm—it is not the emotions of the journalist that are used but those of the people caught up in events. This type of story often reworks the inverted pyramid format, starting with what is sometimes known as a “delayed drop” or anecdotal lead to the story in which the audience is drawn into a human-interest narrative. While the world of journalism has tacitly recognized and used this technique for 150 years, it is only in the recent past that it began to be openly discussed and acknowledged.

Throughout the 20th century, repeated attempts were made to undermine or redefine the objectivity paradigm in favor of a greater role for emotion. Few of them made a lasting impact, not least because journalism had positioned itself as an elite profession with clear boundaries it instinctively defended against outsiders. One of the fiercest challenges came from the New Journalism of the 1960s and 1970s as authors such as Tom Wolfe, Norman Mailer, Hunter S. Thompson, and Joan Didion sought to combine traditional reporting with elements of fiction. But the movement, which sought to highlight feeling and subjectivity, failed to be adopted by mainstream journalism.

In Europe, coverage of the Balkan wars during the 1990s posed another challenge with the emergence of what was called the “journalism of attachment” in which the BBC correspondent Martin Bell argued for “journalism that cares as well as knows.” By doing so, he was questioning deeply entrenched values of impartiality and balance, but the BBC closed ranks and once again normative standards of journalism prevailed (in much the same way as “peace journalism” has gained little traction). Countless other challenges came and went, although some, such as the emergence of the outspoken Fox News network following deregulation of U.S. broadcasting, would foreshadow the more emotional and opinionated journalism of today.

How the Taboo Was Broken

The “turn to affect” of the 1990s saw scholars question traditional ideas about representation

and draw on theories of feeling and experience to better understand, among other disciplines such as literature and art, media. Today, we live in a therapy culture, where citizens post their life stories on social media for everyone to share and where they curate their identity on a daily basis. Amid a crisis of trust in traditional forms of news media, newspapers and broadcast news bulletins are perceived by younger generations to be formulaic, stale, and lacking in emotional engagement. And in what has become an increasingly visual society, images delivered by citizens witnessing news events, sometimes referred to as UGC, can appear to be more real and more authentic than images taken by professional news photographers.

Journalism has been sucked into this heady postmodern mix of cultural, societal, and technological change. Journalists are expected to share their experiences and feelings on social media instead of simply outsourcing emotion to the figures who populate their stories. The journalist who was once detached from his or her audience and hidden behind the scenes is under pressure to develop a personal brand and post on social media platforms such as Twitter and Facebook. Emotion in journalism has finally broken cover. This was not the product of one watershed moment but can be traced through a series of key news stories which pointed the way.

The September 11 attacks on New York and Washington, DC, in 2001 represented an emotionally laden story during which large segments of the U.S. media suspended any pretense of objectivity. In December 2004, dramatic footage of the tsunami that wrought havoc across Indonesia was captured by holidaymakers caught up in the disaster; in 2005, survivors of the July 7 bombing of the London transport network sent 1,000 mobile phone pictures and pieces of video to the BBC, which, in turn, decided it was time to set up a special desk to monitor UGC and social media. Within a few years, UGC became an essential component of news reporting and a key factor in driving the new visibility of emotion of journalism.

The ability to draw on such material has benefited “legacy” news organizations in their struggle to retain and win new audiences as social media platforms erode traditional advertising revenues. Still images and video shot by people caught up in events—from terror and natural disasters to

traffic accidents and street brawls—allow readers and viewers to share experiences, blurring the boundaries between news and social media. We now witness in near real-time news stories as they break, from the struggle to prevent a terror attack on London Bridge (captured on mobile phones by passengers in a passing bus) to the killing of 51 people at two mosques in Christchurch, New Zealand (captured by the gunman himself and streamed live through a helmet camera). This new visibility makes for compelling news coverage and engages audiences through often unedited, emotionally intense images. But it also poses ethical dilemmas for journalists. These are not necessarily new dilemmas, but the speed of transmission calls for split-second editorial judgments. Some mainstream news outlets posted raw footage from the Christchurch gunman as part of their online coverage before taking it down and apologizing in the face of widespread outrage. Footage sent into a newsroom or posted online may seem compelling, but the question has to be asked whether it is genuine or an attempt to manipulate the media and public opinion. Verification has always been a key marker of professional journalism and is as crucial as ever in the social media environment.

EMPLOYMENT

Modern journalists include editors, editorial assistants, publishing copyeditor/proofreaders, reporters, news columnists, investigative reporters, content writers, news writers, news correspondents, announcers, anchors, producers, directors, photojournalists, broadcast news analysts, videographers, cartoonists, magazine journalists, political risk analysts, writers, digital producers, podcasters, social media managers, web content managers, and others involved in selecting the news that is shared through print, broadcast, and the Internet.

A journalist's primary allegiance lies with the public. This contrasts with information disseminators such as public relations specialists and press agents, who may hold allegiance to stockholders, companies, or officials. In the United States and other democracies, a key role for journalists is providing verified, actionable information, thereby allowing citizens to make informed decisions in self-governance. This entry discusses the demographic characteristics of those employed as journalists in the United States, the work they do, and the skills they use while doing their work. It then looks at factors that have led to cutbacks in journalism jobs, describes the job search process and the types of available employment for prospective journalists, and potential jobs for those with journalistic skills who decide to switch occupations.

Diversity and Demographics

National data indicate that of journalists employed in the United States in 2010 or later, nearly three-quarters worked full time while the other fourth

worked part time or freelanced for multiple clients with fluctuating income levels. Compared to U.S. workers overall, newsroom employees are more likely to be white and male, according to the Pew Research Center.

The 2019 American Society of News Editors Newsroom Diversity Survey found journalists of color comprised nearly a third of full-time employees at online-only news organizations at the end of 2018. Women made up 50% of online-only news organization employees and nearly 42% of all newsroom workers. People of color represented nearly 22% of the salaried workforce in the survey, which relied on organizations that agreed to participate and cannot be generalized to the U.S. journalism industry as a whole. Among the news organizations responding to the survey, more than a quarter (26.4%) had at least one non-white person in one of three top newsroom leadership roles. The percentage of newsrooms with print and digital operations that had a non-white person in a top leadership role was slightly lower, at 25.6%, and slightly higher in online-only newsrooms, at 29%.

The Radio Television Digital News Association (RTDNA) reported that 27% of those working in local TV news in the United States in 2020 were people of color, which represented a record high, although still below their 39% share of the general population in the United States. People of color made up 15% of the local radio news workforce in 2020, the highest percentage since 1998, according to RTDNA. There was also a slight gain in 2020 in the percentage of news directors leading TV newsrooms. Local TV stations in the South and West showed the most diversity, easily ahead of those in the Northeast with the Midwest lagging significantly behind.

Although people of color represented the highest level of the local radio news workforce in more than 20 years, less than 25% of local radio newsrooms in the United States featured at least one person of color as of 2020. Men also tend to be overrepresented in local radio newsrooms, with women making up nearly 40% of the workforce.

The Work of Journalists

Either through assignment or enterprise ideas, journalists cover a range of activities and events,

including governmental and educational meetings, catastrophes, sports, and entertainment. Journalists need to contact sources and have a basic understanding of media law.

In many news organizations, teams of journalists once went out to cover the news. One person would interview sources and write the story. Another would take photographs. For broadcast, a reporter and a videographer would team to produce spot news. In recent years, it has become increasingly likely for a journalist to work individually researching and gathering content. Where journalists once gathered content for a specific platform, today's journalist must produce content that can be applied to multiple platforms. Multimedia journalists may be responsible for telling a story in text, photos, audio, and/or video. They may need to capture natural sound or background footage as well as recording one or more interviews to tell a story.

Modern broadcast stations hire content producers to produce the 30-minute newscast as well as keep the websites filled with content to provide additional depth to stories. The move to a converged newsroom (i.e., a newsroom featuring aspects of print, radio, and television news) led to the elimination of jobs as an individual journalist with a smartphone could produce work that once required a team of two to three individuals. The modern journalist practices convergence by mixing skills formerly used exclusively in print or broadcast.

Journalists gather information from multiple sources, finding news through focusing on news values of timeliness, currency, impact, unusualness, conflict, prominence, and proximity. They verify information from sources before publication. Many journalists work beats, or specialized coverage areas, that often involve explaining governmental decisions in a way that the average person can understand. In a media environment saturated with choices, journalists must also be good storytellers to capture the consumer's attention.

In producing journalism for the online audience, journalists practice content management and web design while providing links in news articles to vetted materials that provide additional information. Narrative journalism that combines audio, text, and video has become increasingly popular,

as have podcasts that allow listeners to hear the stories behind a news story. Podcasts and social media can also serve as ways to enhance a journalist's reputation and build their following. Although social media has disrupted the news industry, it has also become an indispensable tool for many journalists. Editors play a variety of roles in news organizations, from assigning stories to reviewing them for clarity and correcting grammatical, stylistic, and factual errors.

Useful characteristics and skills for journalists to have include critical thinking, active listening, self-management, time management, resourcefulness, interpersonal skills, critical analysis, data analysis, digital marketing, leadership, flexibility, and independence. The ability to meet deadlines, work productively in group projects, and clearly and effectively communicate information are also key. Some enter journalism with specialized knowledge in economics, health, politics, science, and technology, while other journalists develop this knowledge through their work covering these topics.

To increase the odds of gaining employment, many journalists now keep an online portfolio that provides the opportunity to showcase their skills. The portfolio features their resume highlighting relevant experience along with their best work. Journalists can also network through state, regional, and national press associations, guilds, and societies to find mentors, job opportunities, and help with legal matters. LinkedIn and other social media platforms allow journalists to network online.

The Media Landscape

For most of the 20th century, U.S. journalists primarily worked for family-owned enterprises. In part due to changes in federal laws regulating media ownership, there has been increased media conglomeration since the late 20th century. Ownership of multiple outlets fueled position redundancies. The growing reliance of consumers on online sources of news also has had profound implications for the business model of news organizations, particularly newspapers.

As advertising shifted online, newspapers suffered a dramatic loss in advertising revenue. The rise of online media also resulted in lost

subscription revenue as readers increasingly relied on free online sources of news. Many traditional media outlets initially provided their online content for free, helping to change expectations around paying for news. In a 2019 study by the Knight Foundation and Gallup, 86% of the U.S. adults surveyed said local news should be available to everyone whether they pay or not. Thirty percent of those surveyed said they were paying for a monthly or annual subscription to a news source, while 19% donated to public radio, public television, and/or other nonprofit sources of journalism. A survey by Pew Research Center found even less willingness to pay for news: Only 14% of Americans surveyed by Pew in 2018 said they paid for local news in the previous year through subscription, donation, or membership. The top reason for not paying for news, cited by 49%, was the widespread availability of free content.

The economic problems in the news industry were worsened by the 2008 to 2009 recession. An estimated one fourth of all daily and weekly newspapers in the United States folded between 2004 and 2019, with some communities losing news coverage completely as a result. A 2018 University of North Carolina study found that about 1,300 communities no longer have local news coverage from any source. At least 200 U.S. counties have no newspaper at all, according to a 2019 report from PEN America.

The closures, and cutbacks in the newsrooms that remain, have had severe consequences for many U.S. journalists. From 1990 to 2018, 60% of workers in the U.S. newspaper industry lost their jobs. Across all types of news organizations, nearly a quarter of newsroom journalists lost their jobs from 2008 to 2018. The greatest decline occurred at newspapers, which saw nearly half of their jobs disappear. A third of the largest newspapers in the United States reported layoffs between January 2017 and April 2018. While the number of digital-native newsrooms went up by 82% between 2008 and 2018, a quarter of digital-native news sites reported layoffs in 2018.

The number of people who lost media jobs in the United States in 2019 alone has been estimated to be as high as 7,800. Those losing their jobs included editors, fact checkers, administrators, artists, foreign correspondents, bloggers, videographers, layout and design employees,

writers in daily news, fashion, finance, health, national security, opinion, politics, sports, and other specialists who previously worked for small newspapers, alt-weeklies, and media conglomerates.

The early 21st century also has seen heightened concern over audiences' ability to distinguish credible news sources from less trustworthy ones. Those who consume news from a variety of sources online take on the task of filtering relevant information, which was previously handled by media gatekeepers who verified information before passing it along to the public. Many now rely on social media and search engines to find news online, which can expose them to diverse sources of information. At the same time, the rise of social media has allowed for the rapid dissemination of misinformation, some of it created deliberately by unscrupulous actors for partisan reasons, monetary gain, or a mix of both. The rise of "fake news" was a major topic of discussion as the second decade of the 21st century came to a close, as was concern over declining trust in traditional news media sources. While surveys have shown a decline in trust in the news media since the 1990s, concern intensified due in part to attacks on the news media by Donald Trump, who repeatedly called the news media the *enemy of the people* during his presidency.

The Job Search

Most entry-level journalism jobs require media experience and a bachelor's degree, most typically in journalism, communication, mass communication, or a degree in the arts and humanities. Pew Research Center notes newsroom employees are more than twice as likely as other U.S. workers to be college graduates, but they make less money than college-educated workers as a whole. Students wishing to gain experience while working on their degree can often work for student publications including newspapers, television news, radio, and online-only news outlets.

While job opportunities can be found via networking, potential journalists also use the Internet and research skills to locate opportunities. They send potential employers email inquiries featuring links to their portfolios. They typically provide references upon request once certain that the

potential reference would be willing to give a positive review of their performance.

The following median annual wages were reported in May 2018 to the U.S. Bureau of Labor Statistics. The median wage is one for which an equal number of salaries were reported above and below the wage; it does not represent the average wage someone in the position might earn. In many cases, there is overlap in the categories between journalists and those working in fields requiring similar skills, such as book publishing.

- Editors, \$59,480.
- Film and video editors and camera operators, \$58,990.
- Reporters, correspondents, and broadcast news analysts, \$43,490.
- Photographers, \$34,000.
- Announcers, \$31,990.

Certain newer journalism roles, such as digital producers or podcasters, may not be captured in the data from the U.S. Bureau of Labor Statistics. This is one factor making it difficult to quantify how many industry jobs have been lost in the early 21st century, as some journalists may be working in roles that did not exist previously. In its annual salary survey, RTDNA reported in 2020 that after accounting for inflation, local TV news salaries fell in 2019 compared to the previous year, the first such drop since 2012. Local radio news salaries rose above inflation, however.

Salary can be a significant factor for those entering the field in deciding whether to take a job offer, particularly when factoring in the cost of living in a new location and any student debt the new journalist may have incurred. Online cost of living comparisons and salary relocation calculators can help provide information to make an informed decision.

Potential journalists must be prepared to contend for positions with the recently unemployed as well as recent college graduates. While some news outlets provide paid internships for college students and recent graduates, it is still common for companies to use college labor with minimal or no pay, although in some cases course credit is

awarded toward degree requirements. Interns also can build a portfolio from work produced during the internship and develop professional relationships that might lead to a job offer.

Organizations hiring journalists typically include local, regional, and national newspapers; radio and television stations; magazines; digital media companies; and other media and broadcast companies. Initiatives such as Report for America, NewsMatch, LION Publishers, and the American Journalism Project are providing support for journalists to cover areas that lost local coverage.

Although it is unclear whether the numbers include new job titles for those traditionally labeled as reporters or correspondents, the U.S. Bureau of Labor Statistics provided the following outlook for 2018 to 2028:

- a 3% decline in editors;
- a 5% decline in announcers;
- a 6% decline in photographers;
- a 10% decline in reporters, correspondents, and broadcast news analysts;
- a 4% increase in multimedia artists and animators;
- a 5% increase in producers and directors;
- an 11% increase in film and video editors and camera operators; and
- a 13% increase in web developers.

Where once it was said freedom of the press belongs to those who have one, now anyone can have a press using platforms like WordPress or even Facebook. Individuals are becoming their own editors and publishers to fill the vacuum left by disappearing local news outlets, in some cases attracting advertising once they build a following.

The Bureau of Labor Statistics does not provide an occupational outlook for online publishers. Additionally, many state press associations do not count online publishers as media outlets even if they are providing the only news within a community. Until such an accounting is made, the numbers of jobs lost in the transfer to new media cannot accurately be identified.

Transferring Skills

The variety of skills that journalists possess often allows them to find work in other industries.

Although the media industry as a whole appears to have shrunk since the late 20th century, with the Bureau of Labor Statistics finding a 4% decline in media jobs from 1990 (1.28 million) to 2016 (1.23 million), new job categories have arisen in social media and other forms of online media. When combined, the four LinkedIn categories of journalism, public relations, content, and social made up a larger share of all hires that LinkedIn tracks in 2018 than they did in 2004, according to Vox.

Knowing how to write well crosses many business sectors. Communicators can use their journalistic skills as multimedia specialists, public relations consultants, newsletter writers, digital and advertising copywriters, market researchers, science writers, book authors, and translators. Among the employers valuing journalistic skills include many corporate communication agencies, nongovernmental organizations, advertising and marketing companies, and higher education institutions. Former journalists may also find opportunities in law, public administration, management, and politics.

ENGAGED JOURNALISM

Engaged journalism is an umbrella term referring to practices and principles that seek to build relationships between journalists and the public. There is not one universally agreed-upon definition of engaged journalism, and there have been tensions between those who prioritize the engagement of consumers in pursuit of financial sustainability versus the engagement of the public for civic participation. However, most researchers and practitioners who use the term refer to approaches that seek to interact with their audience or larger communities in some way to assess and respond to their information needs and interests and to involve them to varying degrees in the journalistic process.

Proponents of engaged journalism argue that by building stronger relationships with audiences and communities, engaged journalism has the potential to build trust. Implicit in engaged journalism is a critique of traditional models of journalism where professional editors and reporters are the sole arbiters of newsworthiness. It challenges journalists not to assume that they alone have the judgment needed to decide what stories are important and how they should be told. Because of the range of interpretations of engaged journalism, its practices can take a wide range of forms, for example, soliciting ideas for stories online, holding open "office hours" for reporters at a library or café, or sharing stories through

participatory theater performances. This entry offers an overview of the origins of engaged journalism, conceptualizations of types of engaged journalism, examples, and some key debates and critiques.

Origins and Influences

Defining *engaged journalism* is complicated in part due to the path by which the term evolved. In the 2000s, as journalists experimented with the affordances of the Internet and then social media, a number of avenues emerged for members of the public to participate in the process of making and disseminating news. This included activities such as commenting on stories and liking or sharing stories. But it also included opportunities to create and circulate user-generated content, an activity closely aligned with citizen journalism and participatory journalism. While many experimental projects came and went, one can view these streams of activity as progenitors of two related pathways: audience engagement and engaged journalism.

Audience engagement has largely followed a marketing logic, prioritizing people as consumers or at least members of an audience, tracking how they behave through actions such as page views or the number of followers or re-tweets generated, and developing strategies to increase these metrics. Engaged journalism, however, focuses on people as members of communities or publics, who may or may not already be part of an audience. Its practices center on encouraging greater participation and trust in media as a means to an end of more inclusive civic dialogue. The lines between audience engagement and engaged journalism are often blurred. Some news organizations have endeavored both, and as a result, *engagement* is sometimes used to refer to either set of practices.

The ethos behind engaged journalism predates the emergence of Internet technologies. The concept resonates with early 20th-century philosopher John Dewey's idea of a public sphere where media coverage could help engage people in public dialogue about civic life. Dewey's view of media's potential influenced the more recent reform movement of public or civic journalism. This movement, which peaked in the 1990s, sought to encourage people to actively participate in civic

dialogue and to prioritize the inclusion of nonelite sources. By the time interactive Internet technologies became widespread, public journalism had largely faded from mainstream discussions. But engaged journalism initiatives have adapted many of the ideas underpinning the movement. Indeed, some of the lead proponents of public journalism, for example, New York University Professor Jay Rosen, have in recent years been active in engaged journalism initiatives.

Engaged journalism practices intersect with practices common within citizen journalism, community journalism, and international media development. Many grassroots programs have long offered training for community members and youth to share their stories through community radio, television, and newspapers—and more recently through their digital equivalents. Likewise, many of the practices now associated with engaged journalism, for example, community discussions, have long been practiced on an ad hoc basis by a number of news organizations, particularly in the public media realm. Fields and skills outside journalism, notably community organizing and facilitation or mediation skills, have also influenced engaged journalism.

The term *engaged journalism* became more widely adopted following a combination of publications, conferences, and interest among the philanthropic community. These included Jake Batsell's 2015 book *Engaged Journalism: Connecting with Digitally Empowered News Audiences*, as well as a number of online posts outlining the philosophy and practice. A number of key convenings brought together practitioners and educators including the "Experience Engagement" unconference hosted by the Agora Journalism Center and Journalism That Matters in 2015, and the People Powered Publishing Conference held annually from 2016 to 2019. These gatherings also connected practitioners working on engaged journalism with philanthropic funders who would prove pivotal to the wider adoption of engaged journalism—particularly Democracy Fund, the Knight Foundation, and the News Integrity Initiative.

A Spectrum of Engagement

As mentioned, engaged journalism practices and projects can take a range of forms. Practitioners

and scholars observing engaged journalism have noted several axes along which engaged journalism practices can be charted to examine the depth of engagement and where the engagement falls in the journalism process.

Andrew DeVigal, who directs the Agora Journalism Center and its engaged journalism focused project Gather, argues that one can view engaged journalism as a continuum from transactional to relational engagement. Transactional engagement includes activities centered on learning, following, and endorsing—many of the activities associated with audience engagement through social media. Relational activities include participating, collaborating, and leading—and focus more on building relationships with the public in pursuit of civic engagement.

This continuum of engagement complements a number of frameworks developed by scholars exploring engaged journalism initiatives. This includes Regina Lawrence, Damian Radcliffe, and Thomas Schmidt's continuum from thin to thicker engagement, where "thin" practices include tracking audience metrics, and "thicker" approaches include face-to-face meetings and events. A related framework offered by Andrea Wenzel, community-centered journalism, looks at the degree projects center and share power with community stakeholders as opposed to newsrooms, and how activities affect relationships between community groups, residents, and local journalists. Finally, Lindsay Green-Barber and Eric Garcia McKinley suggest one can assess different types of activities within projects for characteristics of trust (authenticity, transparency, positivity, diversity, consistency, and shared mission) to potentially predict the degree they may build trust with audiences. Each of these models suggest that deeper, more relational, engagement more effectively builds trust between journalists and communities or publics.

In addition to looking at the depth of engagement, observers of engaged journalism have also noted the importance of *when* engagement interventions take place within the news production process. In a traditional newsroom structure, the public plays a relatively passive role as a potential audience, at most commenting on stories after they have been distributed. Engaged journalism often tries to intervene at various points along this traditional production and dissemination cycle.

Jennifer Brandel, who founded the trailblazing engaged journalism company Hearken, offered an alternative model of "public-powered journalism" that sought to involve the public throughout the cycle of a story. Hearken's online tool, which newsrooms can embed on their websites, invites users to ask questions they want reporters to follow up on. Brandel suggested this ideally gave people an opportunity to participate from the pitch (by asking questions), to assignment (voting on their favorite questions), to reporting (accompanying the reporter), and finally to feedback. Studies of how newsrooms use Hearken, however, have found that many have been more apt to involve audiences early in the cycle (particularly to generate story ideas) than at later stages. This challenge is not exclusive to Hearken, as many engaged journalism tools and projects have focused more on earlier phases of the production process. Indeed, there are very few examples of projects that consistently engage with the public through all stages of the development and dissemination of news and information.

Engaged Journalism Cases

Looking across these spectrums of engaged journalism projects, there are some notable functions that a number of projects focus on. These include listening, co-creating news and information, distributing information as a service, seeking feedback and accountability, convening, and organizing. Some projects focus on one of these elements, while others incorporate many of them. What follows are some brief examples to illustrate these engagement goals, focusing on projects on the more relational side of the engagement spectrum. While these examples draw from the United States, people practice engaged journalism in multiple countries.

Listening: The aptly named Listening Post Collective offers resources and consulting to support community-centered projects taken on by local news outlets around the United States. The initiative emphasizes the value of information needs assessments (which they often do through basic surveys) to determine what information communities need and want and where they go to exchange it. Many of the projects have followed assessments with more opportunities for listening

by establishing audio recording stations or “listening posts” in the community for people to share views and experiences, as well as other interactive platforms such as the text messaging service GroundSource.

Co-creating news and information: Among the many innovative projects run by the nonprofit civic journalism lab City Bureau, the Documenters project offers training and pay for community members to attend and document public governance meetings. The project compiles databases of civic data that can be searched by professional journalists or any interested citizen and challenges the idea that gathering and recording information should exclusively be the work of journalists, as opposed to the work of citizens.

Distributing information as a service: Outlier Media began with the aim of serving the information needs of low-income communities in Detroit, where housing and utilities are two of the biggest issues. The project buys lists of cell phone numbers and texts people, inviting them to reply if they want information (replies are then shared automatically by syncing to city and county databases) or want to ask a journalist questions. By reimagining the concept of service and accountability journalism, the project provides actionable information directly to residents, rather than reporting *about* them.

Creating accountability by convening and organizing: Free Press News Voices champions the use of community organizing strategies to increase the power of residents to make local journalism more accountable and inclusive. Through projects around the United States, they act as connectors, often facilitating convenings between community stakeholders and local news organizations. Through this work, they seek to strengthen local news ecosystems in a way that centers racial equity and community-driven solutions.

Controversies and Critiques

As with any reform-oriented subfield, engaged journalism has its critics and controversies. Like public journalism or citizen journalism, engaged journalism has faced concerns from some within the journalism establishment who worry people may perceive these practices as advocacy. For some, engaging with communities calls into

question norms around journalistic independence or “objectivity.” Some proponents of engaged journalism counter that journalistic “objectivity” has always been problematic and contradictory—encouraging reporters to develop close ties with elite or government sources but being suspicious of similar ties with community organizations.

Another point of contention within the engaged journalism sphere that highlights the blurred lines between audience engagement and engaged journalism is over whether these practices lead directly to revenue. Some proponents have argued that engagement is a way to encourage audience loyalty and increase the likelihood of membership or subscriptions. However, as scholars such as Jacob Nelson have pointed out, more research is needed to demonstrate whether improving the quality of work through engagement leads to measurable increases in revenue.

Finally, as with all journalism, a lack of diversity within newsrooms poses problems for engaged journalism. It is particularly challenging when efforts attempting to include communities are centered in majority white newsrooms attempting to reach out to Black, Indigenous, and people of color (BIPOC) communities. In such situations, coverage is more likely to be *about* BIPOC communities than *of* and *for* them. This dynamic has also led to concerns that engaged journalism may be siloed into the responsibilities of one or two people with engagement in their titles, rather than being woven into processes across newsrooms and simply being seen as “good journalism.”

ENGLISH ROOTS OF THE FREE PRESS

The origins of journalism are similar across Europe. The newspaper grows out of the time-honored twin impulses to report significant political and economic events or sensational, curious, or trivial ones. These impulses long predate the introduction of moveable type so the arrival of the printing press in the mid-15th century was not in itself a necessary cause for the development of the modern newspaper.

European Background

The printed newspaper, in the form of an unbound, sequentially issued, independently edited publication using the same title but differentially dated does not appear until about a century and a half after European printing began—in other words, around 1600. During that delay, intermittently printed prose newsbooks on major individual events, as well as occasional digests of news, would be produced featuring stories real or imagined (e.g., battles and royal progresses as well as miracles, disasters, crimes, and celestial phenomena). The fictional as well as the factual would all be sold as “true.” These proto-news journals—referred to as *mercuries*, *relations*, *gazettes*, or *avisos*—were of a piece with the printers’ other ephemera, such as woodcuts or ballads on contemporary topics, both serious and sensational.

The most economically and politically significant news enterprise was the regular exchange of information between kingdoms through their

ambassadorial system or by merchants at periodic great fairs or in reports from their factors in distant cities. These communications, however, did not appear in print. They remained handwritten and secret, as they had always been throughout the middle ages. Some were regular enough to be “newsletters” issued to limited readership (a bank’s main clients, for example) in multiple handwritten copies. They continued to be produced by hand well into the 17th century. The news they contained was seen as potentially damaging if published because it could be revealing of state secrets or could possibly jeopardize commercial advantage.

Making this information—known as *intelligences*—more public was a fraught enterprise. Medieval merchants had not much desire to share market intelligence at all. Authorities were also fearful but were more confused as to how to deal with the issue of press control. The problem was that, from the time of the introduction of the press, they had sought to exploit print’s potential as a means of information dissemination for their own purposes. Yet they felt threatened by private presses. In response, states and the church licensed the physical machines and organized printers into monopolistic guilds. They proscribed works and authors, vetted proposals, registered titles, and, as a last resort, banned any work that got through the net, but printing itself remained a necessity. The result was a censorship regime less effective than construed. Policing was rudimentary. Authorities were willing to license publications (inflammatory blasphemous pamphlets, for example) for export that they would not countenance for domestic distribution. Ownership and operation of presses was difficult to control because they were small enough to be loaded on a handcart or concealed in any room.

Despite this somewhat confused official approach, what emerged in the 16th century was an ever-increasing need to distribute commercial intelligence. During the long period of print media incubation, feudalism was collapsing and mercantile capitalism was emerging as the basis of economic organization. To work, the new system needed not secrecy but informed participation. It was these realizations that finally “caused” independent printed news in its modern form to emerge, despite its destabilizing potential as far as

the authorities were concerned. By the start of the 17th century, the pressure mercantilists brought to bear—because they needed a constant flow of information to conduct their businesses—had transformed the role of the press. No longer was knowledge deemed to be only of value to princes or banking houses. Couple this development to the established popular taste for the sensational and the foundation of modern journalism was laid. As the towns of Europe grew, so did the merchant class and the numbers of those who wrote, printed, and published newsbooks and a range of newssheets.

Especially in the German-speaking cities, printers (*mercurists* rather than *journalists* at this stage) were licensed to produce regular *corantos*, instead of occasional newsbooks and mercuries. In 1605, Abraham Verhoeven started a *coranto*, *Nieuwe Tijdinghen*, in the Netherlands. By 1617, he was publishing weekly and eventually, in the 1620s, these *New Tidings* came out as often as three times a week. By then journalism had one very big and long running story to cover. What was to become the Thirty Years' War—a paroxysm more than a century in the making as the tensions produced by the Protestant Reformation were transformed into a bloody and interminable conflict—had begun in 1618. Nearly a third of the population of the German-speaking lands was to die in these decades mainly by disease and famine as the Catholic Church fought Protestant princes.

Censorship in the Netherlands, a republic established in provinces recently independent of Spain, was less draconian than elsewhere. Dutch printers, taking advantage of this, published in many languages including English.

English Press Controls

English printers were less fortunate than their Dutch counterparts, and strict controls via a licensing system were exercised though the Stationers' Company. As a medieval guild of those responsible for the production of manuscript editions originally, the Company had a monopoly over print as well. In 16th-century England, the printing of news took the same form as on the Continent with the appearance of occasional newsbooks. Sensation, however, sold as well as politics and was less liable to cause offense so

English printers did not include the political content that the Dutch and German *corantos* did in the early 1600s. Nevertheless, in 1620, the first *coranto* written and printed in English was imported from the Netherlands without official action being taken against it. Essentially, the English authorities were permissive because the news it contained focused on the Continental war. However, in August 1621, when a London printer, Thomas Archer, started his own publication with the same Continental content—but unlicensed by the Stationers' Company—he was quickly imprisoned.

The authorities did allow two other printers, Nathaniel Bourne and Nathaniel Butter, to emulate Archer the next month. Butter had been a freeman (member) of the Stationers' Company since 1604 so their *Corante, or, Newes from Italy, Germany, Hungarie, Spaine and France . . . Out of the Hie Dutch Coppy printed at Franckford . . .* was licensed and therefore allowed. The countries named in the title changed with each edition, functioning much like a headline. Bourne and Butter sought no news of their own but merely translated and reprinted coverage of the Continental conflict from Dutch and German *corantos*. They were, therefore, dependent on the flow of publications across the English Channel and their printing schedule was dictated by the arrival of the packet boats. Sometimes *The Courante*, which settled as a quarto publication of between 8 and 24 pages, failed to appear for more than a week; at others, three editions might be printed within a 7-day period.

Their success was emulated by other licensed publications; but all the printers knew that their situation was fraught with potential danger, and by the early 1630s, even reporting the European war was getting more difficult. Any coverage of domestic English events, of course, was avoided, as it would bring instant sanctions. Despite this caution taken by printers, in 1632, the king's Court of the Star Chamber banned the *corantos*. England and Scotland, recently united under a single crown but uninvolved in the Continental fighting, were Protestant realms fearful of Catholic intrigues and interventions. The protracted conflict had simply become too sensitive a political topic for public debate. That Bourne and Butter alone printed 500 copies of every *coranto* they

issued was no recommendation in the eyes of the authorities. The printers did not willingly forego this business and, in 1638, they successfully petitioned to have the publication licensed again and subsequently sold under the learned name of *Mercurius Britannicus*.

English Civil War and the Press

The *Mercurius* continued as it had before with its diet of Continental news but soon a bigger story would sweep away the ban on domestic coverage. As the King and Parliament headed toward armed confrontation, the Star Chamber, the main organ of overt press suppression, was abolished by Parliament in June 1641. A new form of journal, the weekly *diurnal* appeared: *The Diurnall: Or, The Heads of All the Proceedings in Parliament* began that December. Parliament tried to maintain the old licensing system by banning unlicensed news publications but, with the distractions of the coming conflict, this had little effect, and the diurnals proliferated. In August 1642, the first fighting in the English Civil War began. The war was to act as midwife to what was to become and remain Europe's most outspoken press.

In the fog of war, English printers made a breakthrough that was to condition all subsequent developments. Throughout the long period of press incubation on the Continent, there had been a flood of pamphlets arguing, more often than not hysterically, either the Protestant or Catholic cause. These organs formed a tradition of propaganda and opinion quite distinct from that of news publications. However sensational and mendacious these last were on occasion, they were "true" in ways that the pamphlets were not. These two journalistic streams come together for the first time in the English news publications of the Civil War period (the 1640s).

Early News

On the one hand was the sobriety of the diurnals. Take this report of the most traumatic event of the war:

Tuesday January 30. This day the king was beheaded, over against the Banqueting house by White-Hall. The manner of Execution, and what

passed before his death take thus. He was brought from Saint James about ten in the morning . . . After which the King, stooping down, laid his necke upon the blocke, and after a very little pause, stretching forth his hands, the executioner at one blow severed his head from his body.

This is on page three (because it was a Tuesday and the publication began with the events of the Sunday) of Samuel Pecke's *A Perfect Diurnall of the Passages in Parliament* for the first week of February 1649. Pecke, despite a refusal to sensationalize his reports, was printing 3,000 copies a week.

On the other hand, Marchmont Nedham—the Parliament's and later the republican leader Oliver Cromwell's main apologist—and his Royalist rival, Sir John Birkenhead, inserted into their mercuries a tone which had only previously been found in pamphlets. Take one example from the *Mercurius Britannicus*, *Communicating the affaires of Great Britaine for the better Information of the People: From Monday the 28. Of July, to Monday the 4. Of August, 1645*. Nedham wrote:

Where is King Charles? What's become of him? . . . If any man can bring tale or tiding of a wilfull King, which hath gone astray these foure years from his Parliament, with a guilty Conscience, bloody Hands, a Heart full of broken Vowes and Protestations . . . Then give notice to Britannicus, and you shall be well paid for your paines: So God save the Parliament. (quoted in Clarke, 21)

This enthusiasm, partisanship, and wit came to condition the English newspaper: a unique mix of the coranto's sober reporting tradition and the argumentative dynamism of the pamphlet.

Journalism in England was now infected with a different spirit from that on the Continent. Dr. Theophraste Renaudot, Marchmont Nedham's French counterpart, who started the *Gazette de France* for Louis XIV, wrote: "Was it for me to examine the deeds of the government? My pen was only the grafting tool." Nedham's position was very different: "I tooke up my pen for disabusing his Majesty, and for disbishing and disposing his good subjects, and for taking off vizards and vailes and disguises . . ." (quoted in

Smith, 130). Crucially, of course, Louis's position was very different from Charles'. He had defeated a revolt of his nobles while Charles lost his head.

In the midst of this social upheaval, the English press became a veritable engine of liberty. When in August 1643 the poet John Milton published an unlicensed anonymous pamphlet in favor of divorce, which was then an illegal proceeding, Parliament summoned him. His defense there not only provided the burgeoning news publications with a theoretical basis for the exercise of a free press but it also produced, the following year, in the (again, deliberately) unlicensed form of a pamphlet, a first, great printed public affirmation of that principle in English. He called the pamphlet *Areopagitica*, after the hill where the ancient Athenian high court met. It was subtitled "A speech of Mr. John Milton for the Liberty of VNLICENC'D PRINTING, to the PARLIAMENT OF ENGLAND": "Give me the liberty to know to utter, and to argue freely according to conscience above all liberties." It was, he claimed, "as good almost kill a man as kill a good book."

In one sense Milton was merely extending a concept that lay at the heart of Protestantism itself—liberty of conscience—to embrace the secular world of politics as well. His liberality, though, should not be overstated. He wrote the divorce and his concept of unlicensed printing did not in fact run to allowing Catholic texts, for example. In fact, for a time he was to act as Cromwell's censor. Nevertheless, there was something new and crucial in his stand, a *de facto* justification of Nedham's and Birkenhead's feisty editorial attitudes. Libel, blasphemy, and sedition would still constrain publication but the fail-safe position, as it were, was that publication should be unlicensed; and therefore, at least in theory, free.

The Restoration Press

This move toward press freedom would have counted for little, however, if, after the Restoration of the crown in 1660, the old controls had been effectively re-imposed; but, despite what was to become centuries of effort on the part of British authorities, they never quite were. In 1662, Charles II had passed a new act for the licensing of the press but the crown's power was now so weakened that it was only a temporary measure. In

1695, this Printing Act was again up for renewal when Edward Clarke, a member of Parliament, successfully persuaded the House of Commons that the weight of existing laws "makes this or any other Act for the restraint of printing very needless" (quoted in Sutherland, 25). The act was not renewed. Clarke was influenced by his friend, the philosopher John Locke, who had argued that, contrary to the assumptions of a divine right of kings, there was a right of resistance if the crown forfeited through its actions a claim on the loyalty of its subjects. Nedham, according to Locke's argument, had a right to write as he did. Religious reform and political theory had joined hands in arguing for a level of personal freedom that would slowly embrace, with struggle, the concept of a free press.

Yet 1695 cannot be said to mark the start of this freedom any more than did the *Areopagitica*. The existing laws were still vigorously applied with the backing of a special police force known as the *Kings' Messengers*, who had the powers of a "General Warrant." This warrant allowed for the search of any premises for unlicensed presses; and soon, special taxes on newspapers (a term that had first appeared in the 1670s) were imposed. Nevertheless, because of the Civil War and English radical thinking, the English newspaper flourished.

The English now caught up with the one daily newspaper, which had first appeared in Leipzig in 1650. In 1702, Samuel Buckley brought out the London *Daily Courant*, a single sheet printed on one side but very much, as its name suggests, an echo of the old corantos; that is, a digest of translated foreign news.

The 18th-Century Press

Despite the taxes and authorities being ever quick to bring offending journalists to court—even to the gallows if accused of treason and sedition—the early 18th-century London press attracted "giants to write for it" including Daniel Defoe, Jonathan Swift, Joseph Addison, and Richard Steele. Journalism flourished during this time. In effect, the state was now constrained by an assumption that the British people and their press were free to impart and receive information. The idea of a free press could not be extirpated:

“Freedom of speech,” wrote the London journalists John Trenchard and Thomas Gordon under the pen-name “Cato” in 1720, “is the right of everyman, as far as by it he does not hurt or control the right of another; and this is the only check which it ought to suffer, the only bounds it ought to know.” By the 1760s, this was assumed to be Common Law. William Blackstone, the great jurist whose *Commentaries on the Laws of England* was in the baggage of every English lawyer emigrating to the American colonies in the late 18th century, held that “The liberty of the press is indeed essential to the nature of a free state; but this consists in laying no previous restraints on publications, and not in freedom from censure for criminal matter when published.” The press was not to be above the law but neither could it be censored—controlled by prior restraint. This was not quite the positive “liberty . . . to utter” for which Milton and the other radicals had argued; but it was a “right to hear.”

In 1763, as Blackstone was formulating this concept of “no prior constraint,” John Wilkes, a famous and radical member of Parliament, was charged with publishing, in his paper *The North Briton*, an “infamous and seditious libel tending to influence the minds and alienate the affections of the people from His Majesty and to excite them to traitorous insurrections against his political opponent whom he accused of prostituting the crown. He, of course, claimed Parliamentary immunity and Chief Justice Parry agreed; but what was important was that Parry also held that the General Warrant under which Wilkes had been arrested, a hangover from the 17th century, was now illegal under English Common Law.

All that remained of the old censorship apparatus was the unique rule that in press libel cases juries only determined the fact of “publication,” not of the libel itself, as the latter was the judge’s determination to make. In 1769, in another case involving an anonymous journalist, “Junius” (who has never been identified), the judge upheld the libel but the jury, absurdly, held it had not been “published” despite being printed and the known publishers (now named in ordinary warrants) being before the court. The law, in other words, had been made a fool of. With this precedent, it was to become increasingly difficult to prosecute newspapers. Juries would not convict, often

against the background noise of public protests outside the courthouse.

Elsewhere the positive principle of “the right . . . to utter” (not merely the concession of “no prior constraint”) was incorporated into statute for the first time, albeit on what turned out to be a temporary basis, in Denmark (1761) and in Sweden (1776) and, for a few weeks short of three years, in revolutionary France starting in 1789. Press freedom had become one of the Enlightenment’s *Droits de l’homme*: “The free communication of thoughts and opinions is one of the most precious of the rights of man.” Two years after this Article XI of the French revolutionary constitution, the first U.S. Congress caught up with the French (and the constitutions of some American states) to pass the most long-lived of these 18th-century statutes, the First Amendment. But in Great Britain, homeland of the concept, the slow erosion of formal state controls continued without any enactment of a free press right.

Direct attack on the press via the law, though, was no longer a possibility. To control the press, the British state had only the tools of taxation and bribery. Robert Walpole, the first man who could be said to hold the post of Prime Minister, was accused of spending 50,007 pounds of public money, some of which had been obviously raised by the taxes on print and the bribing of newswriters, printers, and publishers in the 1730s. The last recorded governmental bribe occurred in 1820.

The Stamp Act, a tax levied on all newspaper copies, persisted but also became increasingly difficult to sustain. In 1822, Home Secretary Sir Robert Peel ordered that tax-dodging publishers should not be prosecuted as this too often led to public disorder; however, the lowly distributors, often women, remained at some risk. A decade later, the unstamped press was estimated as having a readership of 2 million, more than did the legally stamped papers. A campaign for the brilliantly branded “Repeal of the Taxes on Knowledge” eventually resulted in a series of abolitions—of the duties on advertisements in 1853, on newspapers in 1855 and, finally, on newsprint itself in 1861.

The press at last was “free” but there was still no statutory “liberty . . . to utter.” It was not until the Human Rights Act of 1998 that the “freedom to hold opinions and to receive and impart information and ideas without interference by public

authority” became part of British statutory law. By then, however, the time was long past when a radical newswriter could sell discombobulating journalism printed on a little flatbed press. Newspapers were big business. The British press was “free,” but it was also, perhaps more importantly, “safe.”

ENTERTAINMENT JOURNALISM

In the first decades of the 21st century, new forms and delivery systems for arts and entertainment were accompanied by shifts in how the public consumed news and comment on all aspects of entertainment. The rise of blogs and other Internet-based avenues for sharing information helped democratize entertainment journalism by throwing it open to amateurs and semi-professionals. At the same time, some see a decline in serious criticism by trained professionals, resulting in a trivia-obsessed public and a reduced market for serious reviews of traditional art forms.

The parameters of entertainment journalism can be difficult to identify. Journalism *about* entertainers can lose definition when many journalists appear to have *become* entertainers. The practice of mixing news with entertainment is not new; it dates at least as far back as the medieval period, when traveling troubadours and theater troupes in a preliterate age shared gossip and events from towns they had recently visited. But

such light content has increasingly dominated what is being called a *postliterate age*.

When Neil Postman wrote his landmark treatise *Amusing Ourselves to Death* in 1985—before the rise of the Internet and its incarnations of news lite—he was primarily concerned with the dumbing down of the United States and the world in a postliterate age. He saw this phenomenon as the result of people gorging on the eye candy of television in preference to the more intellectually demanding medium of print. Postman had no objection to entertainment, even of the mindless variety; what he feared was a citizenry that could no longer tell the difference. This entry discusses changes in journalism on the arts and entertainment in the United States from the early 20th century to the present and some of the factors in these changes.

Split Focus

The split focus of entertainment journalism is aptly conveyed by considering two textbooks: *The New York Times Reader: Arts & Culture* (2011), edited by Don McCleese, which offers advice and examples of how to write arts reviews, profiles, and commentary, and Ben Falk's *Entertainment Journalism: Making It Your Career* (2018), which includes some advice on writing traditional reviews but moves well beyond it to cover the ins and outs of working with public relations representatives to generate celebrity tidbits for blogs and social media. To be sure, the public appetite for celebrity is nothing new—figures such as Rudolph Valentino and even Marie Antoinette come to mind as examples of public figures who drew outsized attention. Today, online venues such as TMZ—as well as more traditional platforms that have gradually shifted their focus—compete for attention on the same devices that may hold novels, classic poetry, spiritual texts, and full-length opera recordings. The sublime and the profane are but a click away from each other.

Electronic content blooms eternally without benefit of critical journalistic attention. Users upload a reported 500 hours of video content to YouTube every minute (as of 2019). This, the second most popular website, was purchased by the most popular, Google. YouTube posters who gain

a following can receive a cut of the advertising in this \$15-billion-a-year business.

All of this is quite challenging to traditional journalism. Legacy media must maintain a presence in social media and on YouTube, balancing the competing risks of cannibalizing their core business by giving it away free versus achieving irrelevance by hiding content behind a paywall that few may be willing to cross. Algorithms continually recommend new videos based on those already viewed, replacing the function previously held by critics and word of mouth.

Decline of Trust in Expertise

All forms of journalism have suffered from an observed decline of public trust in expertise. Consumers who rely on aggregate ratings of apps such as Yelp may be less likely to become loyal followers of individual critics. With the distrust in expertise comes skepticism about anyone who would attempt to assert moral authority. And yet there is no lack of voices doing just that.

Entertainment journalism at the end of the second decade of the 21st century is marked by a growing conundrum: We have fewer critics of the arts than we did 100 years ago. Yet at the same time, we have far more of them.

In the early 20th century, when magazines were the only national medium in the United States and newspapers were at their most plentiful, a major city like Chicago would have roughly a dozen daily newspapers, each with its own theater, music, and art critics. A hundred years later, Chicago had a few suburban papers and two major downtown dailies, only one of which, the *Chicago Tribune*, dominated those zip codes that were home to most patrons of the arts. Other cities followed the same pattern.

While the proliferation of blogs and websites has increased the raw number of critics writing, most communities find that for a play or exhibit to succeed financially—to draw enough customers to support the organization that produced it—it must gain a positive review from the critic who works for the dominant (or, in an increasing number of venues, the only) newspaper.

This proved true even in New York, widely acknowledged to be the cultural capital of the United States. Although the city has supported

three viable daily newspapers into the 21st century, *The New York Times* had an outsized influence on the success or failure of performing arts organizations. It was a rare show that could succeed without a positive review from the *Times*. When it came to books, that influence was nationally felt.

Media mergers, even when they did not result in a reduction of the number of newspapers, sometimes led to a reduction in force of arts and entertainment journalists. For example, various San Francisco Bay area newspapers that merged under the umbrella of the *San Jose Mercury News* saw the replacement of separate arts critics with one critic whose reviews and features appeared in multiple newspapers. The nation's traditional arts establishment found itself in an environment where a hundred blogs by unknown writers could not counteract the influence of the one remaining (and thus more powerful) newspaper critic.

These developments affected the performing arts (theater, dance, and live music including opera and symphonies as well as rock and roll and other popular genres) and museum arts (painting, sculpture, and performance art) more profoundly than they did recorded and broadcast arts, such as motion pictures, recorded music, music videos, and video games. But even these electronic arts were affected: Fewer newspapers meant fewer critics. As remaining newspapers felt the pinch of decreased revenue, they often dropped critics of nonlocal art forms. It became an unnecessary luxury to carry a local movie critic when reviews were available from syndicated sources and readers could access reviews in national publications online.

Changes in Reviewing

In the early 20th century, when a dozen local critics would review the same performance, a public that bought more than one newspaper might take disagreements among critics as a cue to apply their own critical thinking to any given work of art. A review might be seen as less a verdict and more an invitation to consider and discuss the meanings and artistry of the work in question. A hundred years later, the critic for *The New York Times*—or the critic for any city's dominant newspaper—could not help but feel the weight of his

or her review. Given the increasing price of performing arts events—even after accounting for inflation—the main function of each review seemed to have devolved into a monetary one: Should the reader buy this product or pass it by? The arts had always been subject to commercialization. Now they had fallen under the spell of commodification, the idea that as the monetary value of something increased, its intrinsic value decreased.

That trend was exacerbated by the transformation of culture from something that occurred live and in person to something that was downloaded or streamed on personal computers or smartphones. As art became a slickly packaged product to hold in one's hand, journalism about art increasingly took on the mantle of consumer guide. The essential question in these types of articles shifted from "Is it good art?" to "Is it worth the price?"

In some ways, the rise of the Internet hurried these trends. For example, websites such as Craigslist seriously undercut newspapers' ability to make money with classified advertising, leading to cost cutting on the editorial side. And the Internet itself became a one-stop marketplace where one could sample, share, pay for, and consume free snippets and full-length downloads or streams of artistic products.

On the other hand, the Internet also carried the possibility of counteracting some of these trends. The movie website Rotten Tomatoes collects a wide array of reviews for every new film, allowing readers to compare views as well as the differing aesthetic stances of a wide variety of critics. Some may use this as a way to comparison shop, but others might be drawn into a deeper consideration of film as an art form—and may feel compelled to post their own views.

In addition, some online sites that feature arts, culture, and entertainment criticism from professional writers are both topical and provocative, including sites such as Vulture, the pop culture section of *New York* magazine's website. In 2020, the George Jean Nathan award for excellence in dramatic criticism was given to Soraya Nadia McDonald for her work as a culture critic for *The Undeclared*, an ESPN blog.

The Internet can be tawdry and anonymous and obsessed with surface values but can also

become the venue for the creation of a community of dedicated art lovers who share personal views and even art itself. Online communication is as honest and serious and deep as its users choose to make it.

If, as Marshall McLuhan famously wrote in the 1960s, “The medium is the message,” there is some evidence that attention spans are dwindling as a result of the nature of the Internet itself: shimmering pixels on a screen loaded with hyperlinks that invite split focus and rapid-fire clicking from one source of stimulation to another. When attention spans shrink, so does the ability to consider complex ideas and sophisticated art forms. That said, historians caution that the penchant for short bursts of entertainment predated the Internet. Late oral historian Studs Terkel observed that the practice of channel surfing—rapidly clicking from one television program to another—was a throwback to the age of vaudeville, when one frenetic act after another would enter stage right, perform hurriedly for 2 or 3 minutes, and then exit stage left to make room for the next dog-and-pony act or juggler or singer entering stage right.

Obsession With Celebrities

Celebrity journalism has never been more popular, but, as with infotainment, it is not an entirely new development. Marie Antoinette was nothing if not a celebrity in France’s era of self-published pamphlets (a precursor to blog culture). Pamphleteers speculated endlessly about what was or was not going on in the bed of the young queen and King Louis XVI. In the United States, celebrities were among the most popular subjects for the new field of photography in the late 19th century; Napoleon Sarony built his career photographing leading actors of the day.

As attention turned from stage actors to film stars, the celebrity business kept pace, building cult followings for figures such as Valentino in the early 1920s. That trend grew with new media products, from the oversized photo magazines such as *Life* and *Look* in the late 1930s through the phenomenally successful launch of *People* magazine in 1974 and into the spawning of a seemingly infinite number of websites devoted to film stars and hip-hop artists.

Amateur Hour

Just as the line was blurring between professional and amateur entertainment journalists, increasing opportunities developed for amateur performers to make a splash, and sometimes a killing. More than a century after vaudeville had discovered up-and-coming talent during regularly scheduled amateur nights, television turned to its audience to cast performers as either legitimate talents or laughably inept wannabes. *American Idol* (2002–) is a phenomenally successful “reality” television program, based on a British precursor, which in turn appeared to have its roots in an earlier American free-for-all first broadcast in the 1970s called *The Gong Show*, in which performers kept going until a gong let them know they had worn out their welcome.

The *Idol* shows invite audience members to text message their votes to help determine whether a given performer should continue on to the next round of competition. *Dancing with the Stars* (2005–) follows a similar format, but pairs stars not known for their dancing ability with professional dancers in ballroom competition. The third component of both these shows is a panel of judges, each of whom gives critical comments and casts votes themselves. The winners and even the runners-up in *American Idol* sometimes receive lucrative recording contracts.

Results of these network programs have been widely reported as news in the media. The programs raise difficult questions for entertainment journalism. Are these celebrity judges—noted more for their personalities than for their learned comment—functioning as legitimate critics? Had art been reduced to a commercial contest?

Serious Criticism

In such an environment, one might expect professional entertainment critics to be growing superfluous and perhaps disappearing entirely. Indeed, serious arts criticism, which never had commanded much airtime, appeared to be in further decline on television in the early 21st century. Newspapers, city and national magazines, and a few public radio stations have continued to offer news and reviews of the fine and popular arts, as do a number of websites. Several awards promote

recognition of the best commentary and criticism each year, including the Pulitzer Prizes, the National Magazine Awards, and the City and Regional Magazine Association's annual awards.

The most severe long-term threat to the careers of critics, however, was the aging of audiences for fine art forms like dance and opera. Dwindling coverage led to dwindling support, in a vicious cycle. The more serious arts each have respected publications with smaller circulations, whose topic was easily identifiable by the magazine's title: *Dance*, *American Theatre*, *Art in America*, and *Opera News*, to name a few.

The few newspapers that continue to provide book review supplements have cut back on them. Although the number and size of these book review sections has dwindled, their content is remarkably similar, mixing reviews of new books with excerpts and profiles of authors. Reviews of new books are often written by authors of similar books, and the balance of books reviewed has shifted in recent years from fiction to nonfiction.

A number of magazines continue to offer book review sections. Alongside the more serious magazines are a number of middle-brow national magazines devoted to popular arts. *Entertainment Weekly* is one of a very few that covers the spectrum of popular entertainment in the United States. Others focus on music, with *Rolling Stone* and *Spin* (the latter now online only) covering rock music broadly, while other magazines focus on individual formats such as country and hip-hop. Movie fan magazines, once dominant in entertainment journalism, were in decline by the early 21st century.

The Business Press on Show Business

The most thorough reporting on show business can be found in the relevant trade press. Magazines such as *Variety*, *Billboard*, *Publishers Weekly*, and *The Hollywood Reporter* follow both the big picture of company mergers and acquisitions as well as the endless statistics of box office receipts and record sales.

Perhaps the best gauge over time of the many changes in the entertainment industry could be found in *Variety*. When it began publication in New York in 1905, it was but one of dozens of magazines covering variety entertainment (which

included vaudeville, burlesque, and circuses) in the United States and England (where variety was called *music hall*). All of the English magazines covering music hall lived and died with the art form. *Variety* survived, largely because it followed its professional readers into new worlds of music recording, motion pictures, radio, television, and, eventually, video games and the Internet. The DNA of changing American popular culture can be read in the small print of *Variety*'s back pages.

World in Flux

Just as entertainment found new forms in the early 21st century, so too was entertainment journalism in flux. The prospects for steady employment for serious critics and reporters seemed hazy at best while the opportunity for abuse was great. In the mid-19th century, when the average working critic was not given a byline, there is evidence that many were open to bribes of money and food. Some theatrical producers went so far as to send in positive reviews they had written about their own presentations—and some newspapers, desperate for copy, ran them as is.

A similar crisis of trust faced the public 150 years later as bloggers stepped out from under the umbrella of publications with established reputations and began to self-publish. A Google search for reviews of a film or live performance might turn up an undifferentiated mass of writing by unknown authors of unknown affiliations, which could make it difficult for readers to gauge where they would find sound opinions. Yet this also has allowed readers able to think critically and willing to search and winnow to find golden needles in an immense and unruly haystack of the factual, the fake, the reasoned, and the ranting.

ENTREPRENEURIAL JOURNALISM

The term *entrepreneurial journalism* is used to describe a kind of journalism practiced in response to changing fortunes in the commercial newspaper business. Set in motion by an economic downturn coupled with the rise of digital news in the 21st century, entrepreneurial journalism is a response to help sustain both the business and reporting sides of journalism. The practice and approach to entrepreneurial journalism calls for innovative and creative ways to navigate and solve revenue disparities in a media ecosystem shifting from advertising-supported print products to online publishing. This type of journalism is practiced by those whose jobs in the newspaper business were impacted by a decline in advertising support coupled with audiences moving to free online platforms to get

news and information. Many newspapers saw sharp losses in display and classified advertising revenue as well as subscriptions and cut reporters and other staff and resources to stay economically viable.

Entrepreneurial journalism is sometimes described as a mindset. A person who identifies as an entrepreneurial journalist does not adhere to long-held traditions where the business of journalism is strictly separate from the reporting function. Entrepreneurial journalism still operates within the boundaries of what constitutes normative practices of the profession but with more attention paid to audience engagement. While a precise definition is difficult to explicate, the term can be characterized by a set of practices that brings an entrepreneurial spirit to the profession of journalism. The practice and approach to entrepreneurial journalism calls for innovative and creative ways to navigate and solve revenue disparities in an ever-changing media landscape that involves online and digital-first publishing practices. This entry first discusses the business model of journalism and the characteristics of the entrepreneurial journalist. It then discusses the emphasis on audience engagement and collaboration in entrepreneurial journalism. Finally, it discusses efforts under way to teach entrepreneurial journalism.

Business Model

Entrepreneurial journalism as a business can be described as a response to digital disruption to the newspaper business. The business of the newspaper industry was upended by digital innovations that moved audiences and advertisers away from printed products to mostly free, online options. At most newspapers, this resulted in a permanent decline in both advertising support for news publications and a decline in subscribers to print newspapers. As audiences are turning to social media and free news websites to get news and information, legacy news organizations have faced difficulties remaining financially sustainable.

Efforts have been made to monetize news online, but very few legacy newspapers have succeeded in making online subscriptions and online advertising restore their financial resilience.

Advertisers who were once the backbone of the commercial newspaper industry are turning to social media and other ways of reaching audiences, and the once lucrative classified advertising buyer is now turning to free places, such as Facebook or Craigslist, to buy or sell items. Those changes have forced many newspapers to close, consolidate, reduce their publications, reduce coverage, and let go reporters—some of whom had spent decades working as a journalist. The term *entrepreneurial journalism* emerged as a way to describe a new business model for news in the early 2000s and accelerated in use after the great recession of 2008.

In contrast with large news organizations, entrepreneurial journalism is a low-cost option enabled by digital media technologies and social media. As a result, entrepreneurial journalists are nimbler and more responsive to an ever-changing media ecosystem. With this flexibility, they can be more responsive to news customers. By not being burdened with the overhead costs that accompany legacy media, such as office space and print production costs, the entrepreneurial journalism start-up is more agile, albeit less stable.

Because entrepreneurial journalists work independently, they are free from performing under legacy newsroom norms that situate journalists as gatekeepers and disseminators of news and information. Entrepreneurial journalism, rather, embraces engagement and collaboration with audiences. Free from the restraints of a corporate ownership and traditional newsroom culture, practitioners of entrepreneurial journalism approach stories differently and understand their audiences as active participants rather than passive receivers of news and information. This is a defining tenet of entrepreneurial journalism—a recognition that audiences do more than passively receive news and information. Among the many departures from legacy media traditions, audiences in an entrepreneurial journalism world are understood as active participants in the news-making process.

The Entrepreneurial Journalist

Individuals working as entrepreneurial journalists work independently of legacy news organizations. As a mindset, this journalism practice

borrowed from entrepreneurial ways of approaching business. An assumption of entrepreneurial journalism is that the fundamental relationship between the editorial side and the sales side of commercial news practices are breaking down. Entrepreneurs create new businesses offering a new product or service where new markets often emerge. They are also willing to take risks and are not driven primarily by moneymaking but rather by ideas. Entrepreneurs often work alone or with a small group of individuals who are willing to lose money before they begin making it. Entrepreneurial journalists seek to build their own business alongside their reporting practice, making them distinctively different from the freelance journalist working for a paycheck paid by a media employer. Entrepreneurial journalism, then, can be characterized by a news product and reporting practices that take risks, require innovation, and are not motivated by profits. Rather, entrepreneurial journalism is aimed at addressing societal problems and using journalism to offer solutions.

An entrepreneurial journalist recognizes the need to remain vigilant to what makes journalism a vital component of democracy while loosening the strict divide between the business that supports journalism and those who perform journalism. These journalists embrace experimentation in both how to report news and how to engage with audiences. The practice recognizes that audiences are not mere receivers of information but should rather be understood as a valued part of the news process in order to earn and maintain their trust. Stories are often told through a solutions-oriented lens, addressing audiences more directly.

The journalists who use entrepreneurial methods range from those who found themselves suddenly out of work after a career working for legacy media as well as young people just starting out in the field. While still embracing the values that define traditional journalism, such as truth and accuracy, entrepreneurial journalism is characterized by innovation, and even risk-taking. Often described as responding to disruption, entrepreneurial journalism is a way to describe how practitioners working outside of a traditional newsroom not only perform the duties required of reporters, but also engage with the business side of

the profession as an entrepreneur would in other industries.

Unlike commercial legacy media, entrepreneurial journalism is not necessarily propelled by profits but rather seeks new and innovative ways to report news outside of traditional journalistic business and reporting norms. An entrepreneurial journalist strives to create their own “brand” and uses digital tools, namely social media, to gather, report, and distribute news as well as interact with their audience. For example, the Sahan Journal began as a digital publication in 2013 to report news in English about Ethiopia and Somalia. Founder Mukhtar Ibrahim has grown the digital-first publication into an independent, 501(c)(3) nonprofit digital-first newsroom that now reports on immigrant and refugee news in Minnesota. As the Sahan Journal model shows, successful entrepreneurial efforts in journalism often center on a “niche” or a beat as they aspire to build public trust by showing expertise.

The practice of entrepreneurial journalism has developed alongside technologies that allow new ways to gather, report, and receive news and information. The kind of reporting that results from entrepreneurial journalism efforts is often different. Topic focus from what many perceive as only reporting “bad” news to what constitutes solutions and problem-solving.

Entrepreneurial journalism is a break from legacy media, signaling a journalism practice that operates outside of traditional, place-based news organizations. A journalist working as, or embracing the mindset of, an entrepreneurial journalist does not subscribe to long-held norms of legacy news organizations that there must be a strict divide between the business side and the reporting side of news. The entrepreneurial journalism mindset rejects the long-held value that journalists must remain separate from the business side of the process to do their jobs. The idea that journalists must be independent of sales and marketing to remain unbiased and fair or “objective” may linger as a normative value among a generation soon to be passing the torch along to those who have never known a world without digital-first publications and social media.

There are journalists who began their careers as entrepreneurs before working for established

media organizations, as opposed to those who became entrepreneurial journalists in order to continue doing reporting as a career. A notable example is Brian Stelter. In 2004, while a college student at Towson University, Stelter started a blog called *TVNewser* about the television news business. His work caught the attention of news organizations and many relied on his blog and commentary to understand the changing media environment. He sold his site to Mediabistro and continued running it until 2007. His entrepreneurial endeavor ended when he took a position at *The New York Times* as a media reporter. He has since joined CNN as chief media correspondent and host of the top-rated news program “Reliable Sources.”

Engaging Audience and Trust in News

Once a celebrated practice deemed imperative to maintain public trust and credibility, the separation of the business and reporting sides of journalism are blurred or even altogether eliminated in entrepreneurial journalism. This has raised concerns by media ethicists who point to problems of journalistic independence and conflicts of interest. But proponents of an entrepreneurial mindset argue that the transparency and collaboration that marks the work of an entrepreneurial journalist can help restore the public’s trust in journalism at a time when surveys indicate a majority of Americans distrust the news media. This focus is reflected in not only attempts to rebuild trust in journalism but also to treat audiences in a fundamentally different way. No longer understood as receivers of news and information, this type of journalism seeks to engage the audience and empower the public.

What undergirds the entrepreneurial journalist is a desire to rebuild public trust in journalism as an institution. It has been described as journalism going beyond “who, what, where, when, why, and how,” and adding “what now?” Many legacy news outlets remain rooted in a belief that competition between newsrooms and journalists is a path to better journalism. Entrepreneurial journalism takes a different approach. This includes engaging with audiences through social media and community-engagement activities to ascertain their views of what should be

reported. A critique of this approach questions whether this merely provides audiences with what they want to hear rather than the news they need to know in order to participate fully in democracy.

Collaboration Over Competition

In an industry where competition between organizations and individual journalists has always been a cornerstone of the field, working across such boundaries is certainly anathema to many long-time practitioners of journalism. Entrepreneurial journalism recognizes the need for changes to competitive practices in order to stay viable and serve the public interest. Collaborative projects and partnerships have increasingly been shown to improve journalism and its reach. Entrepreneurial journalism also extends collaborative efforts between reporters and newsrooms. Once unimaginable inside of legacy news organizations, experimentation with entrepreneurial journalism is happening at some of the largest newsrooms, such as *The New York Times* and the Gannet Corporation. Not immune to the attrition in the news business, many large dailies, small town weeklies, and start-ups alike are trying to innovate by using entrepreneurial journalism practices in their newsrooms. Legacy news organizations have “audience engagement” and “UX” (user experience) positions to incorporate entrepreneurial practices in their newsrooms.

On an international scale, entrepreneurial journalism manifested in a collaborative project called the *Panama Papers*, referring to documents from an offshore law firm that were leaked to a German newspaper and were the basis for investigative stories published in 2016. More than 100 media partners from nearly 80 countries around the world participated and reported in more than two dozen languages—reporting that revealed worldwide corruption involving governments, politicians, and the financial industry. The project, led by the International Consortium of Investigative Journalists, is hailed as one of the largest collaborative reporting projects in history. The *Panama Papers* had the kind of impact that many entrepreneurial journalists hope their work will have in the communities they serve.

Teaching Entrepreneurial Journalism

Journalism schools are teaching entrepreneurial skills in their classrooms, and institutions are emerging that are committed to supporting journalists doing community-centered, specialized reporting to better serve the public. Those who have championed entrepreneurship in journalism include Jan Schaffer, who served as entrepreneur in residence at American University and ran J-Lab, an institute for news entrepreneurs and innovators. Another early evangelist for entrepreneurship in journalism is Jeff Jarvis, the director of Tow-Knight Center for Entrepreneurial Journalism at the City University of New York.

Entrepreneurial journalism is seen as one solution to sustain newspapers as the long-held business model of advertising financial support is in decline. The challenge remains for journalists practicing this type of reporting to remain independent while creatively seeking new ways to make a living. Time will tell if entrepreneurial journalism continues to be used to describe journalism practices in the digital age.

ENVIRONMENTAL JOURNALISM

The creation and rise of the environmental beat in journalism has coincided with increased public and government interest in the environment. Beginning in the 1960s, there was a shift away from viewing environmental harm as an accepted cost of living in an industrialized world. Journalists responded with such stories as how automobile exhaust was choking the air of cities and describing water pollution so foul that a river could catch fire. As the beat matured, so did the reporting, and journalists needed to delve into increasingly complicated issues such as whether chemicals were threatening human health and whether the world's temperature was rising.

Today, while the number of journalists covering the environmental beat is historically high, more are independent journalists as opposed to staff writers tied to the security of an established news organization. Still, the biggest story—the consequences of a warming planet—has become so dire that the beat's future appears guaranteed. This entry discusses the origins and development of environmental journalism, the state of environmental journalism in the 21st century, and the central position of climate change in environmental coverage. It then looks at some of the challenges posed to providing strong coverage of the environment.

Origins

The state of the environment has always been important to humanity. Cave paintings 40,000 years ago depicted an environment of game and daily life. Explorers for centuries told tales and later wrote journals of their travels. Yet when modern journalism developed in the 19th century, it was slow to embrace environmental coverage. An exception was William Cullen Bryant, editor of the *New York Evening Post*, who led an editorial movement to establish a public park in 1844 that led to the creation of New York's Central Park. Slowly, others followed his lead.

Beginning in 1876, George Bird Grinnell championed the establishment of both the national

park system and the national forests in *Field and Stream*. Nature writer John Muir and Robert Underwood Johnson, editor of *The Century Magazine*, led campaigns to preserve such national treasures as the Yosemite Valley in California. The muckrakers of the early 20th century at times touched on environmental issues. Lincoln Steffens, writing for *McClure's* and *American Magazine*, exposed timber frauds in the Pacific Northwest forests. Ida Tarbell uncovered the ruthless practices of the Standard Oil Company and John D. Rockefeller. Still, the first major journalism award for an environmental story did not occur until 1941 when the *St. Louis Post-Dispatch* led an editorial campaign against industrial soot and smoke that was so thick that it could turn day into night. The newspaper won a Pulitzer Prize, and the air grew cleaner.

Rachel Carson's *Silent Spring*, published in 1962, helped change society's thinking about the environment. A biologist, Carson, criticized the widespread use of DDT, an insecticide that had wiped out malaria in the developed world and drastically reduced it globally. DDT was so popular that in the 1950s, American communities were using it to spray entire neighborhoods to kill unwanted pests. The problem was that it also killed wildlife, including birds ranging from robins to eagles. Carson called the use of such chemicals a *sinister* force. The chemical industry responded with a major marketing campaign questioning the book's premise. Yet *Silent Spring* became a best seller and prompted the U.S. government to review and eventually ban the use of DDT. Carson set the stage for a new era by encouraging the public to question what was happening to the environment and to human health.

The Beat Develops

By April 1970 when the first Earth Day was held, it drew millions of participants who did not want to live in a world wasted by pollution. The U.S. government responded by enacting a series of far-reaching environmental laws, including creating the Environmental Protection Agency (EPA). News organizations added to their focus, devoting new resources to the environment. The weeklies *Time* and *Saturday Review* started regular sections on

the environment, and cable television broadcaster CNN had regular environmental programming. *National Geographic* produced special printed reports as well as broadcasts on network television. As early as 1973, *Editor & Publisher* listed 95 newspaper reporters who identified themselves as specialists covering the environment.

One of the biggest stories of the 1970s came out of Niagara Falls, NY, when a local reporter, Michael Brown, wrote about how the Hooker Chemical Company had buried hazardous chemicals beneath a residential neighborhood. Love Canal became the poster child for the hazards of toxic chemicals. It also led to the creation of the EPA's Superfund program that spent billions of dollars cleaning up the nation's old waste sites. Love Canal catapulted to fame a 27-year-old homemaker named Lois Gibbs whose chief aim initially was to find out why her two children kept getting mysterious ailments. She became a community organizer who helped initiate an unprecedented relocation of families in the Love Canal neighborhood that cost \$17 million.

Early on many stories were shaped by a simplified white-hat-black-hat environmental view. Reporters too often relied on interviewing government officials, activists, and business groups while ignoring scientists. Or big events shaped the news such as the nuclear power accidents in Three Mile Island in Pennsylvania in 1979, Chernobyl in the former Soviet Union in 1986, and the 1984 chemical spill in Bhopal, India. But as society delved deeper into understanding its environment, the stories became more complex and challenging to report. For instance, as the population grew in the U.S. Sun Belt, the pressures of development clashed with the region's diminishing water resources, creating environmental policy challenges. Efforts to control floods and provide water in places such as Louisiana and Florida were found to be destroying wetlands and making some coastal areas more prone to flooding. Human development was creating a range of biodiversity issues, from vanishing wildlife species to new invasive plants and insects.

21st-Century Developments

The environmental beat sustained many of the same setbacks in the opening decades of the

21st century as did other news coverage. Traditional news organizations shrunk in size and clout. A new generation of Internet-based, technology-driven start-ups provided welcome competition but often struggled financially and journalistically.

What new technology did provide were new opportunities to report on the environment. The Internet often works as a visual medium and both new and old news organizations discovered innovative ways to employ that development. One example was *The New York Times* online report in 2012, "Snow Fall: The Avalanche at Tunnel Creek." It used print, video, and graphics to produce a strikingly dramatic and compelling story. Another was the online news organization Reveal, which in 2016 distilled satellite data to dramatically and visually report on which mansion owners in Los Angeles had the lushest lawns and were violating water limits during a drought.

Small online start-ups, many of them nonprofits, could easily concentrate on a single beat, such as the environment. Inside Climate Change, with only seven reporters, won a Pulitzer Prize in 2013 for stories about a massive oil spill and then collaborated with the *Los Angeles Times* to produce a blockbuster series about Exxon's climate policies. Collaborations on vast, complex stories also developed. A prime example was a 2015 series by the Huffington Post and the International Consortium of Investigative Journalists about the World Bank's environmental consequences.

Using a key journalistic tool, crunching computer databases to produce newsworthy information, became a staple of some of the best environmental coverage. One measure of the beat's strength was the continued vibrancy of its primary professional organization, the Society of Environmental Journalists. In 2019, it had a record membership of more than 1,500.

Climate Change

All of these critical technologically driven changes have occurred when one environmental story in particular has grown to dwarf all others. Beginning in the 1980s, a scientific consensus began to form that gases, including carbon dioxide from human sources, were building in the upper atmosphere and creating a greenhouse effect that was

warming the planet. The Intergovernmental Panel on Climate Change, created by the United Nations and composed of the world's preeminent climate scientists, issued reports beginning in 1989 warning that these emissions needed to be sharply reduced in the near future. Otherwise, said the IPCC, sea levels would rise, droughts would increase, there would be more frequent and violent storms, and ecosystems would undergo massive changes. The political response was weak, especially from U.S. government and industry. Early on journalists were accused of not understanding the science and of putting too much emphasis on stories about the uncertainties of global warming. While recent coverage has been more robust, the story remains a major challenge for journalists.

Climate change has been linked to increased, catastrophic storms and fires, but pinning a specific event to the warming planet is difficult. This can cause confusion, especially at a time when the issue has also become highly politicized. Many politicians are skeptical about the science and have accused scientists and the press of being biased. A major UN treaty was adopted in Paris in 2015, but 2 years later, President Donald Trump withdrew the U.S. commitment to the accord. In 2021, Trump's successor, President Joseph Biden, announced that the United States was rejoining the Paris climate agreement. By the end of the second decade of the 21st century, world temperatures continued to set records, and many impacts were occurring at rates higher than scientists had forecast.

Beat Challenges

Journalists must deal with scientists, government officials, and advocates to do their job and each pose distinctive challenges.

Journalism and science communities have a history of distrust, wariness, and sometimes outright hostility. Each approach language differently. Scientists need to be specific and precise. That approach sometimes is labeled jargon. Journalists need to write broadly and generally to a wide audience. In addition, science often works slowly; journalists seem always on a deadline. The very nature of science has been to take enough time to adequately assess a concept, even if it takes years or even decades. For scientists, the biggest concern

is typically the possibility of journalists not getting the story right. Too often scientists complain that journalists simply do not get their facts correct. Journalists agree that accuracy is paramount but argue that some errors are inevitable in their fast-paced culture aiming reports at a general audience. To bridge this gap, both sides have launched a range of training programs designed to better communicate and understand each other.

Good science should create sound government programs and policies, but it is not always clear what constitutes the most pressing issues. Citizens, public policymakers, and journalists have all struggled at times to deal with environmental risks, which can be confusing and cloaked in emotion rather than objectivity. For instances, those who study risk management say the public often views potential threats to children or chemicals with strange names harshly and disproportionately in relationship with the science.

Besides science, environmental journalists must also understand the roles of government, economics, and business. Authority to regulate environmental issues is spread between a multitude of national, state, or provincial, and local agencies as well as some regional and even international organizations. In the United States, while the EPA is perhaps the best-known environmental agency in the country, it is often small, local agencies that are the first line of protection in providing clean water, and sewage and waste disposal.

Advocacy is especially important in the environmental beat. The National Center for Charitable Statistics in 2019 identified nearly 15,000 non-profit environmental groups that vary in size and approach. One of the largest, the Nature Conservancy, is dedicated to buying and preserving land. Another large, global group, Greenpeace, embraces nonviolent social protest as a tool for change. Many other environmental groups are small grassroots organizations focused on local issues. Internationally, the issues raised by many of these advocates and journalists can put both groups at risk. Global Witness, a London-based human rights organization, reported in 2016 that more than 700 activists had been killed in the previous 15 years. For journalists, the dangers were not as high. Reporters Without Borders reported 10 killed for environmental reporting between 2010 and 2015. Still, such threats can diminish coverage.

Business and industry groups were also active in promoting their approach to the environment. They often retained public relations consultants and spokespeople to get their side of the story out. Public relations consultants call such environmental campaigns *green PR*, while critics use the phrase *greenwashing*. Sometimes, such efforts have successfully bridged the gap between environmental advocates and business and caused the two sides to work together. Environmental journalists use all of these as sources, seeking to separate spin from reality.

What is sometimes misunderstood, even by journalists, is whether reporters who write about the environment are pro-environment. How can anyone be against a cleaner environment? Some have argued that environmental journalists pick sides and present a biased story, especially if it involves climate change. In 2015, *The Guardian* in the United Kingdom began an editorial campaign discouraging the use of fossil fuels causing the climate crisis. While much of the campaign was tied to the opinion pages, some spilled over to the news pages. *The Guardian* was criticized, and only a small percentage of environmental journalists embrace this concept of advocacy journalism.

Dramatic stories such as oil spills and nuclear accidents first drew attention to the environmental beat. But most environmental stories lack drama. Rather than striking with a fury, they ooze, seep, or bubble silently and are often unseen. The disappearance of an animal or plant species, for instance, might be imperceptible as it is happening to all but the scientists who study that species. Climate change offers the greatest of all of these challenges. As technology continues to change journalism, and it becomes more interactive between news producers and consumers, the thick red line between opinion and straightforward reporting is likely to become more blurred over issues such as climate change. The challenge in the future will be to find the clearest and most straightforward way to tell those stories. Environmental journalists increasingly have more and better tools to accomplish that task. Acting on them will be critically important for future generations.

ESPIONAGE ACT

On June 15, two months after the United States entered World War I, Congress passed the Espionage Act of 1917. Implemented by A. Mitchell Palmer, the United States attorney general under President Woodrow Wilson, the purpose of the Espionage Act was to thwart avoidance of the draft, prevent the sabotage of state activities, and define the act of espionage during wartime. However, the act's subsequent interpretations led to the prosecution of socialists, pacifists, other anti-war activists, and members of the press.

Because the Espionage Act criminalized the transmission of information, the scope of the terms had implications for the First Amendment and freedom of the press. Though the courts debated the degree of immediacy to national security that must be proven to warrant criminal prosecution, proponents of the Espionage Act argued that imminent danger during wartime warranted restrictions on First Amendment rights to freedom of speech. This entry looks at what activities can be prosecuted under the Espionage Act and the ongoing debate over when prosecution under the law is justified. Several examples of cases prosecuted under the Espionage Act are discussed.

The Espionage Act of 1917 largely made it a crime for any person to obtain or disclose information related to national defense for the purposes of undermining the war effort or for the advantage of any foreign nation. This included criminal penalties for anyone impeding enlistment or rousing disloyalty and disobedience in the armed forces. Mailings that violated any provisions of the act or advocated insurrection or resistance to any law of the United States were deemed illegal. The act also deemed it illegal for any person to publish information that the president regarded as a danger to national security or could be useful to the nation's enemies. Based on the terms dictated by Congress, any person found to have transmitted information in order to injure the war effort could be sentenced up to 30 years or even death, and face a \$10,000 fine.

Congress enacted the Sedition Act of 1918 as amendments to the Espionage Act. The terms of the Sedition Act enforced similar penalties related to false statements and insults or agitation against the federal government during the war. This also included disrupting the production of war materials, harming the flag, or supporting, teaching, or defending any of these acts. According to the law, it became illegal for any person to, "utter, print, write, or publish any disloyal, profane, scurrilous, or abusive language about the form of government of the United States, or the Constitution of the United States, or the military or naval forces of the United States." Both pieces of legislation were used during World War I and the first Red Scare. While the Sedition Act of 1918 was

repealed in 1920, parts of the original Espionage Act remain in force.

President Franklin D. Roosevelt used the Espionage Act during World War II to create the Office of Censorship. The office issued a specific set of wartime practices that required correspondents covering issues abroad to submit their articles and photographs to military censors.

In 1919, the debate over the extent to which immediate danger during wartime justified the restrictions of the Espionage Act came to the fore in a series of U.S. Supreme Court decisions. In *Schenck v. United States*, the Court upheld the conviction of socialist Charles T. Schenck, who circulated flyers to draftees that included a quotation from the Thirteenth Amendment of the Constitution to argue that conscription was inhumane and forced on the public by politicians and a compliant press. In the Court's unanimous decision, Justice Oliver Wendell Holmes Jr. said that "clear and present" wartime danger justified restrictions on First Amendment rights.

On June 16, 1918, after visiting three Socialists convicted of violating the Sedition Act, Eugene V. Debs gave a speech opposing U.S. involvement in World War I. Debs, a pacifist, labor leader, and the Socialist party's standard-bearer in five presidential elections received almost 1 million votes when he ran in 1912. He was convicted of violating the Sedition Act and sentenced to 10 years in prison. Debs appealed and the case went to the Supreme Court where the Court applied the clear and present danger test. Although the Court upheld the conviction in 1919 in *Debs v. United States*, the charges were dropped after Congress repealed the Sedition Act. The same day as it ruled in *Debs v. United States*, the Supreme Court issued its decision in *Frohwerk v. United States*. Jacob Frohwerk was convicted of 11 counts under the Espionage Act for publishing articles in the Missouri newspaper *Staats Zeitung*, protesting U.S. involvement in World War I. The Supreme Court upheld Frohwerk's conviction and expanded the clear and present danger test by elaborating on the scope of restrictions on free expression during wartime.

Eight months following the ruling in *Debs v. United States*, a decision was handed down in *Abrams v. United States*. Jacob Abrams and

several other Russian immigrants were charged and sentenced to 20 years in prison under the Espionage Act for denouncing American intervention in Russia. They printed and circulated two leaflets appealing to the workers of the United States and supported a general strike if the United States intervened in Russia. Applying the clear and present danger test in *Abrams v. United States*, Justice John Clarke, writing for the seven-member majority of the Court, applied the clear and present danger test in upholding the immigrants' sentence. However, Justice Holmes wrote a dissent saying that Abrams's leaflets presented no immediate danger and arguing for the "free trade in ideas." Later cases, such as *Brandenburg v. Ohio* (1969) elaborated on Holmes's free speech theory by developing the incitement test, which differentiated between dissent speech and speech that posed an imminent threat to national security.

In 1971, former defense analyst Daniel Ellsberg leaked the Pentagon Papers, a then-secret history of United States involvement in Vietnam, first to *The New York Times* and then to *The Washington Post*. Ellsberg was charged under the Espionage Act and went to trial in Los Angeles; however, the judge dismissed the charges.

In 2013, Edward Snowden, a former National Security Agency contractor who disclosed to the press classified documents revealing details of the agency's surveillance programs, was charged with violating the Espionage Act and stealing government property. *The Guardian* first reported on the revelations from the documents and many news outlets follow suit, including the *New York Times*, *Washington Post*, and NBC News. Shortly after going public as the source of the leaks, Snowden, who had been staying in Hong Kong, flew to Russia, which in 2020 granted him permanent residency.

In 2013, a military court found Private Chelsea Manning guilty on six counts of violating the Espionage Act and sentenced her to 35 years in prison after she leaked hundreds of thousands of pages of State Department communications and military files to WikiLeaks. She had been in prison for 7 years when President Barack Obama commuted most of the remainder of her sentence and she was released in 2017.

In August 2018, former National Security Agency contractor Reality Winner was sentenced

to more than 5 years in prison under the Espionage Act. She pleaded guilty in June 2018 to leaking a classified report on Russian interference in the 2016 U.S. election to a news outlet, *The Intercept*.

In October 2018, a federal district court in Minnesota sentenced Terry James Albury, a former FBI agent, to 4 years in prison under the Espionage Act for releasing internal FBI documents to the press. Albury pleaded guilty but argued he was acting in the public's interest because he divulged racism in the FBI as a law enforcement agency and in investigations.

In May 2019, WikiLeaks founder Julian Assange was indicted on 17 counts of violating the Espionage Act. Three of the counts were specifically based on the act of publishing secret military and diplomatic documents in 2010.

Much of the recent debate surrounding leaked information and violation of the Espionage Act centers on who counts as a journalist. Some argue, however, that the First Amendment should protect any persons or organization whose purpose is to inform the public regarding issues of public interest and have raised concerns over whether journalistic activities, regardless of whether they are conducted by a "journalist" or anyone else, can be prosecuted as crimes in the United States.

ETHICS

Journalism ethics is a branch of professional ethics. Recognizing the power of communication technologies worldwide today, occupations in the media are now included with such professions as medicine, law, engineering, and business under the purview of applied ethics. There are many parallel ethical concerns such as autonomy and accountability, but common to all professions is the issue of professional power, both its uses and abuses. Although journalists have been roundly criticized for more than a century, the exponential growth in media ethics did not occur until it began rising in parallel during the 1980s with the growth of professional ethics as a whole. The challenge at present is whether journalism ethics can contribute to applied ethics as a field while making significant progress on its own complicated agenda. This entry examines the history of ethics in journalism, its internationalization and advancement, and connection to ideas of truth and diversity.

Historical Background

The rights and responsibilities of journalism and the possibility of regulating journalistic conduct have been debated in Western societies since the oldest known newspaper was published in Germany in 1609. But the abuses of the press were not explicitly linked to ethical principles until the end of the 19th century. During the 1890s, a transition occurred from everyday commentary about news reports to a more reflective period, with criticism of various kinds beginning to develop into a systematic ethics. Several examples from this decade can be listed: Sensationalism had been a problem from the beginning, but it took serious institutional form in the late 1890s during the circulation battles between *New York Journal's* William Randolph Hearst and the *New York World's* Joseph Pulitzer before and during the Spanish–American War. Gifts to journalists and free travel to sports events and meetings (freebies and junkets, as they were called) scourged by media critics during the 19th century were now treated more explicitly in the context of big business accountability. Telling the truth as a moral principle was extracted for the first time from the

practice of accurately reporting facts. Invasion of privacy entered the ethics agenda also, based on Samuel D. Warren and Louis Brandeis's "The Right to Privacy" in the December 1890 *Harvard Law Review*. In addition, the groundwork was laid for the free press/fair trial debate.

The elementary work of the 1890s evolved into a more comprehensive effort during the 1920s as journalism education was established within university liberal arts programs. Four important textbooks in journalism ethics appeared in this period: Nelson Crawford's *Ethics of Journalism* (1924), Leon Flint's *The Conscience of the Newspaper* (1925), William Gibbons's *Newspaper Ethics* (1926), and Albert Henning's *Ethics and Practices of Journalism* (1932). Inspired by Abraham Flexner's "Carnegie Reports" on professional training in a university context, a key impetus behind the creation of the early educational programs in journalism was the perceived need to enhance its respectability. Including ethics helped meet that goal.

However, the flurry of journalism scholarship in the 1920s, the growth of professional societies with codes of ethics, and individual journalists who made ethics a priority—even together these trends could not prevent the collapse of ethics in the face of an antithetical worldview called *scientific naturalism*. After Henning's 1932 book, the term *ethics* and its cognates disappeared from mass communications book titles for 40 years in North America. Instead of ethics, advances in the physical sciences became the ideal as academics—including those in journalism—promoted its methods and principles. The period from the 1930s is typically described as the social scientific phase of journalism study, and objectivity was a quasi-scientific method appropriate to it. Objectivity in journalism helped give the press legitimate status alongside the older and more prestigious professions of medicine and law.

Under the umbrella of scientific naturalism, unbiased reporting of neutral information became the standard of good performance. Objective reporting, in its history and practice, was both a methodology and a moral standard. Concern for ethics during the 1930s through the 1960s arose only on isolated occasions. *The Report of the Commission on Freedom of the Press* in 1947 advancing social responsibility was the most

famous counterstatement of this period in North America. In 1954, the International Federation of Journalists, meeting in Tunis, adopted the *Declaration of Basic Principles of Journalist Behavior* oriented to professional duty rather than rights. Periodically there were these pockets of resistance in journalism's intellectual and vocational life; but the neutrality model dominated journalism nonetheless. A preoccupation with the value-centered enterprise called *ethics* seemed out of place in an academic and professional environment committed to the scientific worldview. Not until Wilbur Schramm's *Responsibility in Mass Communication* in 1957 did systematic ethics return to journalism's agenda. Sporadic activity in the 1970s paved the way for the modern period of journalism ethics, beginning in the 1980s. From that decade until today, journalism ethics has revolved around four issues, each of them important to professional ethics as a whole: globalism, theory, truth, and diversity.

Internationalizing the Field

Sean MacBride, Ireland's ambassador to the United Nations, chaired an International Commission for UNESCO on communication and human rights, cultural diversity and the state of professional journalism around the world. The Commission's Report in 1980, *Many Voices, One World: Towards a New More Just and More Efficient World Information and Communication Order*, has established the debates over the economic concentration of communication industries, the possibilities for egalitarian politics through the news media, and the free trade of communications products and services. Its recommendations have served as a framework for professional ethics during the rapid globalization of media technologies since the introduction of the Internet in 1991. The field of journalism ethics took special note of *Many Voices, One World's* recommendations for establishing quality journalism education in every country of the developing world. Ten MacBride Roundtables held around the world (with the first one in 1989 in Harare, Zimbabwe, and the last in 1998 in Amman, Jordan) have kept the fundamental issues alive and developed them further.

Against the backdrop of MacBride, the International Organization of Professional

Journalists produced a document called *International Principles of Professional Ethics in Journalism* at meetings in Prague and Paris in 1983 emphasizing the people's right to timely information. In fact, codes of ethics for professional and academic associations became the standard format in Europe and North America for disseminating ethical principles. Of the 35 states that signed the Helsinki Act, professional media organizations in 24 of them had codes of ethics. In 1995, 31 codes of journalism ethics existed in 29 European countries.

The first systematic treatment by an international network of scholars, *Communication Ethics and Global Change*, appeared in 1989 edited by Thomas Cooper. It concluded that there were three major areas of worldwide concern: truth, responsibility, and free expression. Throughout the 1990s, the Professional Education section of the International Association of Media Communication Research gave mass media ethics a strong emphasis. The University of Paris convened a European/North American conference on ethics in 1993. Francis Kasoma edited a volume of 10 theoretical and practical essays on *Journalism Ethics in Africa*, which appeared in 1994. Pedro G. Gomes of Brazil grounded his ethical model in social communication and liberation theology. There were several initiatives in Australia to develop principles and to monitor policies through press councils and codes of ethics. Early in this decade, the Silha Center bibliography at the University of Minnesota included entries from 10 countries. These are only illustrative.

A major challenge during the decades following MacBride was to replace the Eurocentric axis of communication ethics with a model that was genuinely comparative. The first systematic attempt at developing a comparative model across 13 countries (India, Nigeria, Brazil, Japan, Taiwan, Poland, South Africa, Germany, Venezuela, Colombia, United Arab Emirates, for example) was done by media ethics researchers Michael Traber and Clifford Christians in 1997. Using comparative research and analysis, they identified the sacredness of life as a universal presupposition that yields three ethical principles across cultures: human dignity, truth-telling, and nonviolence. Also in 1997, the Central Asian Independent Electronic Mass Media Association at its

meeting in Bishek, Kyrgyz Republic, adopted a journalism ethics code with an emphasis on protecting privacy. In 1999, the World Religious Alliance launched *A Call to Our Guiding Institutions*, challenging the fields of education, media, the arts and science to follow common ethical guidelines.

In 2003, the *Journal of Media Ethics* published a special issue called *A Search for a Global Media Ethics*. In 2007, a conference on global media ethics for the 21st century was held in Lusaka. Also, in 2007, a series of 3-day International Roundtables in Global Media Ethics was initiated by the University of Stellenbosch in South Africa. Three International Roundtables followed: in 2010 at Zayed University in the United Arab Emirates; at Jawaharlal Nehru University in 2011 in Delhi, India; and in 2014 at Tsinghua University in Beijing, China. The Roundtables brought together journalism ethics scholars from all over the world. In almost all the countries of Africa, there are now a series of specialized agencies dedicated to promoting the regulation of media conduct, such as professional associations of journalists, press associations of newspaper editors and broadcast owners, and journalism research and training organizations. Al Jazeera, upon its origins in the Middle East, has adopted universal ethical standards as described in Haydar Sadig's *Al Jazeera in the Gulf and in the World*. The Asian Media Information and Communication Centre in Singapore publishes papers and hosts conferences on journalism ethics and journalism policy such as freedom of expression. Robert Fortner's *Ethics in the Digital Domain* (2020) and *Ethics in the Digital Age* (2017) by Deni Elliott and Edward Spence are examples of 21st-century textbooks that teach international journalism ethics.

Media technologies are global and journalism ethics needs the same worldwide orientation. All the professions face the global challenge since all of them use borderless digital technology. But on the issue of de-Westernizing professional ethics and doing it comparatively, journalism ethics has taken a leadership role among the professions.

Advancing Theory

From 1978 to 1980, the Hastings Center of New York carried out an extensive study of

professional ethics in American higher education. Funded by the Carnegie Foundation, the results were published in 1980 in a series of volumes and monographs that established the field of applied and professional ethics (for the volume on journalism ethics, see Clifford Christians and Catherine Covert, *Teaching Ethics in Journalism Education*).

Occupations in journalism were included along with such professions as medicine, law, business, and engineering under the purview of applied ethics. The Hastings project made recommendations about course goals, evaluation, indoctrination, and teacher preparation. It established the baseline statistical measures that are used today to teach journalism ethics.

In line with other professional fields, more monographs and research studies of media ethics were published during the 1980s than had appeared since the beginning of the 20th century. In a critical period, between 1983 and 1993, the number of freestanding media ethics courses in American higher education increased by nearly 100%. The most influential contribution to media ethics education—the Gannett-sponsored National Workshop on the Teaching of Ethics in Journalism and Mass Communications directed by Edmund Lambeth—began its 12-year career in 1984.

Scholarly study of media ethics has now established itself as a subset of professional ethics with its own subject matter. The bellwether of the field's development, the *Journal of Mass Media Ethics*, began publication in 1985. Demonstrating the growth of the field, a second journal was initiated in England in 2004, *Ethical Space: The International Journal of Communication Ethics*. An "Ethics Summit" on the state of media ethics was convened in Boston in 1987 by Emerson College, and as a result, it originated in 1990 the biannual *Media Ethics Magazine*, which anchors a worldwide network of proceedings, teaching, and scholarship in ethics. The "Second Ethics Summit" in 2007 was a 25-year follow-up featuring academics and professionals from across the United States with the proceedings published in 2008 as *An Ethics Trajectory: Visions of the Media Past, Present and Future*.

Applied and practical ethics dominate academe. And the trappings of this new field are everywhere outside the classroom too. The Association for

Practical and Professional Ethics began in 1991 and has sponsored an annual conference ever since. Journals such as the *International Journal of Applied Philosophy*, *Ethical Perspectives* (from the European Ethical Network), and *Professional Ethics* deal with generic issues, while virtually all the professions now have their own journals, books, and courses on ethics as well. Interest groups within academic associations are now typical, and centers for ethics and society are commonplace in North America. Research universities are including practical ethics courses within their general education curriculum and in professional programs. Graduate studies typically include seminars in the ethics of scientific research and include a section on ethical standards in social science methodology courses. Liberal arts colleges reflect similar dynamics, introducing courses in bioethics and the ethics of health care, ethics in government, and social work ethics alongside courses in journalism and media ethics. The reissuing a century after its original publication of Henry Sidgwick's *Practical Ethics* (1898/1998) signals this trend toward professional ethics as a field of philosophy with its own subject matter.

As a field within professional ethics, journalism ethics, in terms of its logic and rationale, is bilingual. It combines theory with actual events and real-life dilemmas. Even the most sophisticated journalism ethics emphasizes the way ethical decision-making actually functions in media practice. Therefore, as professional ethics develops itself into a field of philosophy with its own identity, it insists on the dialogic character of theory construction, with principles and practice building on one another interactively. One typical textbook, *Media Ethics: Cases and Moral Reasoning* (11th edition published in 2020), teaches five major ethical theories by integrating them into cases of journalism practice and policies.

In the ongoing digital era, the challenge for ethics is to establish a theoretical agenda in terms of the distinctive properties of this new global technological system. An early version of this task was a special issue of the *Journal of Mass Media Ethics* (1998) devoted to new media technologies. A double issue of the same journal 5 years later, focused on "Virtual Reality and Communication Ethics," developed the idea that the virtual world as the innovative edge of online technologies is the

most advanced context for coming to grips with media ethics theoretically. Communications researcher David Gunkel's *Thinking Otherwise: Philosophy, Communication, Technology* (2007) and his *The Machine Question: Critical Perspectives on AI, Robots and Ethics* (2012) center on ethics throughout, philosophical ethics and media ethics. Gunkel develops a model of moral responsibility within the context of the newest innovations in information technology. Journalist and educator Michael Bugeja's second edition of *Interpersonal Divide in the Age of the Machine* (2017) identifies moral issues that converge across media technologies.

Truth

Language is the lifeblood of society and its institutions; in John Dewey's homespun phrase, "of all things, communication it the most wonderful." Therefore, human existence requires a radical commitment to truth. As a matter of fact, the press' obligation to truth is the key standard of journalism ethics. Truth-telling is the generally accepted norm of the media professions, and credible language is pivotal to journalism's very existence. In all the journalism codes of ethics around the world, truth as accuracy has priority. Truth-telling as the norm for the journalism profession is not controversial. But living up to this ideal has proved nearly impossible. Budget constraints, deadlines, competitive pressures, and self-serving sources complicate the production of truth in news writing. Journalism is often referred to as *history in a hurry*; providing a precise, representative account rarely occurs under such conditions. Sophisticated digital technology accommodates almost unlimited news copy but still requires that difficult choices be made without the opportunity to sift through the intricacies of telling the truth. Despite the unending demands of everyday practice, and contrary to the unjust attacks on today's journalism as *fake news*, the salience of truth as an ethical principle is undiminished.

However, the prevailing view of truth as accurate information is too simplistic for today's social and political complexities, though objectivity remains entrenched in daily practices of news production and dissemination. The dominant

scheme committed to facts is under duress, and as Stephen Ward's *Radical Media Ethics: A Global Approach* (2015) demonstrates, philosophical work is critical for transforming the concept of truth intellectually. A more sophisticated concept of truth is disclosure, opening up the hidden dimensions of meaning. Truth means uncovering the authentic, disclosing the genuine underneath, making reality intelligible for human existence. Already in 1947, the famous Hutchins Commission Report on *A Free and Responsible Press* called for this alternative. It advocated a deeper definition of the press' mission as "a truthful, comprehensive and intelligent account of the day's events in a context which gives them meaning." A truthful account is based on the facts as best they can be determined but also includes the context, motives and presuppositions involved. In terms of disclosing meaning, reporters will seek interpretive sufficiency. They recognize that no clear boundary exists between fact and interpretation; therefore, truthful reports mean credible interpretation rather than first impressions. As former United Press International reporter and journalism researcher Wesley Pippert explained, truth means to get at the core, the essence, the nub, the heart of the matter.

Forsaking the quest for precision journalism does not mean imprecision but more precision in disclosure and authenticity. The best journalists understand from the inside the attitudes, culture, and language of the persons and events that enter news reporting. In the process of reporting a truth narrative, journalists will reduce as much as possible the distance between the concepts of social science and those of the particular news context itself. The best news stories will be true on two levels: they will be theoretically credible (not the promotion of conspiracy and myth) and they will be realistic to those being covered (not seen as speculation). The truth of authenticity unveils the inner character of a series of events. These accounts generate an insightful picture that clarifies the essence of the problem or situation. Rather than reducing social issues to the financial and administrative problems that politicians define, the truth principle requires that the news media disclose the depth and nuance that enable readers and viewers to identify the fundamental issues themselves.

Diversity

Another urgent issue for present-day journalism ethics is not merely the obligation to treat ethnic differences fairly, but how to recognize the identity of various cultural groups that together make up a society. Native languages and ethnicity have come into their own. Sects and religious fundamentalists insist on recognition. Culture is more salient for many than their country. In the United States, for instance, at the turn of the 20th century, 80% of the immigrants emigrated from Europe; starting in the 1960s, the majority has come from Asia, Latin America, and developing countries in Africa. Rather than the *melting pot* Americanization of the past century, immigrants now insist on maintaining their cultures, religions, and languages. In fact, since the Cold War, identity politics has become dominant in world affairs. As a result, news media are challenged to help develop a healthy ethnic self-consciousness rather than reinforce a strident tribalism and divisive ethnicity.

Obviously, news cannot be ethical unless the challenge of cultural diversity is met, and this requires a fundamental shift from pushing homogeneity to recognition of differences. The basic issue is whether democratic societies are discriminating against their citizens in an unethical manner when institutions fail to account for the identity of their members. In what sense, should the specific cultural and social features of Puerto Ricans, Native Americans, Buddhists, Jews, the physically disabled, or children publicly matter? Should government organizations ensure only that citizens share an equal right to political liberties and due process without regard to race, gender, or religion? Beneath the rhetoric is a fundamental dispute that Charles Taylor calls the *politics of recognition*. This foundational issue regarding the character of ethnic identity must be resolved for diversity to come into its own.

The flourishing of particular cultures, religions, and ethnic groups is the substantive goal to which news professionals are generally committed, but it needs deeper application. Susan Ross and Paul Lester's *Images That Injure* (2011) has become a staple of instruction toward that goal. Media researchers John Downing and Charles Husband help fulfill this agenda as well with their historical

review of racial stereotyping as background for proposing a new “multiethnic public sphere” to represent race. The 2008 *Handbook of Critical and Indigenous Methodologies* by Norman K. Denzin, Yvonna S. Lincoln, and Linda Tuhiwai Smith gives a theoretical foundation and specific methodologies for preparing news stories on Indigenous groups. Robert Entman and Andrew Rojecki’s *The Black Image in the White Mind: Media and Race in America* (2000) illustrates a deep application to race in the 21st-century United States. Covering such initiatives as described by Bryan Stevenson in his *Just Mercy* (2014) in both news and editorials will clarify the diversity issue. The “Global Media Monitoring Project,” a comparative study every 5 years in more than 100 countries, is the largest research project in history of gender in the world’s media and presents its results in various news formats. A movement symbolized with the Twitter hashtag #MeToo raises awareness of the pervasiveness of sexual assault and harassment in society. #Black-LikeMe also on social media is an international activist movement that protests systemic racism by speaking out against police killings of Black people and broader issues such as racist profiling, police brutality, and the criminal justice system.

Digital media technologies are globalizing rapidly, but local identities are reasserting themselves at the same time. For journalism ethics, the integration of globalization and multiculturalism is the extraordinary challenge. Contrary to an ethnocentrism of judging other groups against a dominant Western model, other cultures are not to be considered inferior, only different. For multiculturalism, the journalism ethics that is legitimate respects the diversity of the human race even while seeking commonness among peoples everywhere.

Concluding Thoughts

Within philosophical ethics, academics increasingly recognize professional ethics—often labeled applied ethics as well—as a legitimate domain in itself. The issues addressed in journalism ethics are often problematic across several professions—employee loyalty, distributive justice, deception, conflict of interest, and digital

technology, for instance. Legal ethics is equally involved with journalism ethics on the invasion of privacy issue.

Because journalism depends on global technologies, it has been able to demonstrate educational guidance for all the professions on the development of international, cross-cultural ethical principles. For journalism ethics to collaborate with professional ethics as a whole, it helps to ensure that the professions together emphasize the major issues in global professional ethics and are not distracted by the secondary, superficial issues unique to each profession working by itself.

ETHNIC MINORITY NETWORKS

When radio networks first appeared in the early 1920s, ethnic minorities were invisible elements in majority societies and, in many cases, were under pressure to abandon their traditions and conform to mainstream culture. If those minorities spoke “foreign” languages (such as those spoken by Indigenous peoples including the Maori in New Zealand), their languages might be expected to die off in due time, and in many cases, their usage was actively discouraged by educational and religious institutions. While their speakers might be welcome guests permitted to sing or speak in their own tongues, mainstream media would decide when to issue such invitations.

The modest sizes of many minority populations, coupled with their frequent economic weakness and the long prevalence of mainstream assimilationist policies, have meant that minority-operated electronic media outlets have emerged slowly and tentatively, with minority networks lagging even farther behind. That situation still largely prevails, even as civil rights movements, an opening up of the frequency spectrum for both radio and television, the falling cost of broadcast equipment, and a greater acceptance of minority presence in many countries have led to increased minority stations and networks, by and large they continue to lack the resources available to their mainstream counterparts.

Development

By the late 1920s, a few American radio stations were carrying scheduled ethnic minority broadcasts, usually for an hour or less per day. Other countries took similarly cautious approaches. The New Zealand Broadcasting Service first offered continuously scheduled programming in Maori only in 1942: a newscast once a week for 5 minutes. Norway's NRK began scheduled broadcasts in Sami in 1946. Minority networks did not

emerge until the 1960s, and then only gradually: a few to several hours of programming per day, and often for less than the full week. If the networks were part of a larger national public service broadcaster (PSB)—the BBC's Asian Network, for example—they sometimes lacked such support as proportional budgets, "good" broadcast frequencies and sufficient transmitter power, full access to production facilities, or "status" among their mainstream peers. If the networks were commercial services, as with the U.S. Spanish language television networks *Univision* and *Telemundo*, finances tended to be tight and network-originated programming limited. (Both of those networks still rely predominantly on material produced in Latin America for Latin American audiences.)

Whether commercial or public, ethnic/linguistic networks have suffered from a paucity of local outlets through which to disseminate programs, but also from which to *receive* program material. They have created programming but have done little to encourage local outlets to produce programs that could be carried by the networks, which has limited the degree to which networks reflect local ethnic communities. A few networks have assisted growth of local stations and carried their programming, as has happened with Inuit radio in Canada starting in 1970 with the foundation of the Canadian Broadcasting Corporation (CBC) Northern Service. More often, they were highly centralized, as was the U.S. Black Entertainment Television (BET, founded in 1980) network. BET did little to support the establishment and growth of Black-owned-and-operated local TV stations (they numbered 24 in 1991, dropping to 22 by 2006) or to receive material from them.

Since most ethnic minority populations are small and often economically disadvantaged, their networks are not attractive to the financial community as business ventures, and few operate commercially. If those networks are financed through annual audience license fees or government appropriations, the relatively small size of the populations they serve may mean that their fee shares or appropriations are modest. Indeed, governmental appropriations may be cut off altogether, as was Canada's Native Communications Program in 1990.

Despite these obstacles, many ethnic and linguistic minorities now have networks or network-like services. Australia, three Andean countries (Bolivia, Ecuador, and Peru), Canada, three Nordic nations (Finland, Norway, and Sweden), France, New Zealand, and the United States all feature one or more ethnic minority networks. The following selective examples, listed alphabetically, present their origins and the approaches they have taken to serving the informational needs of their audiences.

PSB and State-Supported Ethnic Minority Networks

Australia

Indigenous (Aboriginal) radio services in Australia emerged on a piecemeal basis, often supported by hard-won government funding administered by the Department of Aboriginal Affairs. Community radio obtained legal status in the mid-1970s, and Indigenous groups soon began to participate. The advent in 1978 of the Special Broadcasting Service, a multilingual radio and television service, soon led to the development of an indigenous information program, though not a full-fledged newscast. The creation in 1987 of the Broadcasting for Remote Aboriginal Communities Scheme (BRACS) gradually resulted in the installation across Australia of over a hundred ground stations with modest studios and equipment, as well as satellite uplinks and downlinks.

The BRACS stations helped stimulate development of a national network. The National Indigenous Radio Service (NIRS), founded in 1996, serves as a program exchange and distribution service for the BRACS stations as well as for the many community radio stations carrying indigenous programs. The NIRS also originates several newscasts per day, often featuring items supplied by some of the 130 BRACS operations and 23 indigenous radio stations, as well as stringers and indigenous media centers. It also provides a daily national indigenous talk show, *Let's Talk*, hosted by Tija Bayles, one of indigenous radio's best-known figures. NIRS is supported primarily through annual government appropriations. Support levels for the BRACS stations are low to nonexistent, which impedes many from creating programs.

Australia's indigenous television networks began with Imparja in 1996, which started broadcasting from Alice Springs after a group of Indigenous individuals competed for and received a commercial TV narrowcast license valid for satellite broadcasting to eastern and central Australia. Imparja provides a daily 30-min newscast, which often contains items submitted by the same sources as those featured on NIRS. It also broadcasts occasional documentaries. The weekday children's show *Yamba the Honey Ant* includes informational segments, often in the form of music such as "The Healthy Body Song." Starting in the late 1990s, Imparja also operated Indigenous Community Television, a service featuring videos made by and for Australia's Indigenous population. That service was superseded in 2007 by National Indigenous Television, which then introduced a 5-minute national newscast in 2008 with the intent of expanding it. Both Imparja and National Indigenous Television are supported through Australian government appropriations as well as payments for carrying government announcements of training programs and other information directed to Indigenous audience members. Commercial advertising accounts for only a minor portion of Imparja's annual budget.

Canada

The CBC Northern Service began in 1958, in part because of pressure from Inuit ("Eskimo") listeners impatient at being ignored. The Northern Service catered to both Inuit and non-Inuit populations of northern Canada through shortwave transmissions in English. It introduced Inuktitut language broadcasts in 1960, produced in Montreal and elsewhere in northern Canada. There were a few local terrestrial radio stations in the region, so the broadcasts did provide a network of sorts, which, in the words of the manager of the CBC service in Iqaluit, Nunavut, "enabled Inuit communities, separated by vast distances, to communicate with one another" (quoted in Molnar and Meadows). Following a lengthy series of campaigns conducted by Inuit, Native Americans, and white supporters, local Native American and Inuit stations began to emerge across Canada in the early 1970s. Many were supported through Native Communications Societies (media centers), and

after 1983 through funding from the Canadian Government's Northern Native Broadcast Access Project.

The Inuit Broadcasting Corporation's television service developed from several experimental projects in the 1970s, broadcasting its first regular program in 1982. It was dependent on CBC transmission facilities, which could be used only late at night. After considerable lobbying, the Inuit Broadcasting Corporation received a dedicated satellite transmitter, which enabled an expanded service, Television Northern Canada, to come on air in 1992. That service broadened its scope in 1998 by embracing television programming for Native Americans and Inuit throughout Canada in a renamed Aboriginal People's Television Network (APTN).

Television Northern Canada and APTN both have drawn heavily upon productions from several native communications societies, which provide opportunities for Native Americans and Inuit to produce material for print and broadcast media. Such productions enable the exchange of information through daily newscasts—APTN began a national newscast in 2000—as well as call-in current affairs shows such as *Contact* and frequent documentaries, in both English and tribal languages. APTN has the additional advantage of having been declared a national service, which ensures its availability through cable TV in Canada, thus making it accessible to most households. This also provides APTN with its major source of income through a share of cable and satellite subscriber fees—roughly Can\$30 million in 2007.

New Zealand

Maori radio stations in New Zealand (or *Aotearoa*, in Maori) developed first at the local (*iwi*, or tribe) level starting in the late 1980s, following a protracted struggle with the national government over broadcast licensing rights and funding. The stations all produce local news programs, and some create current affairs, discussion, and call-in talk programs. Some of the programming is in Maori, some in English. Radio Waatea in Auckland is under contract to produce and relay a national Maori newscast in both Maori and English several times daily to the *iwi* stations. Radio Waatea also produces daily and weekly current affairs

programs, including a weekly phone-in talk show. For all of those productions, Radio Waatea works closely with the 21 *iwi* stations, which are themselves interlinked through an online network, and with stringers living in cities and towns lacking such stations. The stations receive most of their financial support through a government-supported Maori funding agency, *Te Mangai Paho*, with further assistance for specific series and one-time programs through another government agency, NZ on Air.

Maori Television made its debut as a distinct service in the mid-1990s. The existing Public Service Broadcasting (PSB) channels had carried Maori language newscasts and a few discussion and cultural programs starting in the early 1980s. It obtained its own channel in 2004, which broadcasts Maori news twice per day and offers two weekly current affairs programs and numerous documentaries (the latter often originating from other minority stations around the world), interview-based programs, and discussions. While there are no purely local Maori television stations, Maori Television has numerous stringers as well as a few full-time reporters around the country. It also provides a video booth at its Auckland headquarters, where anyone may enter and make a brief statement about anything whatsoever. Occasionally this material is incorporated with regularly scheduled informational programs. Funding for Maori Television comes largely through *Te Mangai Paho*, with further support through the NZ on Air agency.

The Nordic Nations

Sami radio in the Nordic nations developed in part because the Sami peoples' campaigns for a voice of their own helped to convince top-level administrators of the national public broadcasting services in Norway and Finland in particular (Sweden was less supportive) that their demands were justified: Sami paid annual broadcast license fees just as did the majority population. Sami stations exist in all three countries as part of the national public service broadcaster, for example, Norway's NRK-TV. In 1965, the stations began to operate as a transnational network in part because the Sami are spread across northern Finland, Sweden, Norway, and Russia, number less than 50,000, and fear the loss of their language, so the sharing of responsibility for programming made

sense. A share of the broadcast license fees provides major support for the three stations.

The joint program schedule (about 6 hours per weekday, two on weekends with each station also providing programming for its own national population) offers a mix of information and entertainment, with several newscasts per day, various interview and discussion programs, occasional documentaries, and coverage of such events as meetings of the Sami Parliament. There is as yet no Sami television service, but since the early 1990s, the radio stations have produced a number of TV documentaries each year, as well as a weekly children's television program, all of which are broadcast through Nordic PSB television services such as NRK-TV.

United Kingdom

As the South Asian and Black populations of Britain pressed for greater rights and better working conditions in the 1970s, some of the newly authorized BBC and Independent Broadcasting Authority local radio stations began to offer programs produced by them. A network of sorts was created in 1989 when BBC local radio stations in Leicester and Birmingham, soon joined by BBC CWR (Coventry and Warwickshire), began to share such productions and to use the title "Asian Network." Proposals for a nationwide network led to the expansion of that network in 1996 and its carriage on the Sky satellite (and later on the Virgin and Fairview satellites as well as Digital Audio Broadcast, or DAB). Programming now includes news and public affairs, with a 30-min weekday newscast and news inserts, and is produced primarily in London, Leicester, and Birmingham. Most of the material is in English, with several hours per day of programs in South Asian languages. The BBC also has an Afro-Caribbean-British 24-hour radio service, 1Xtra, based in Birmingham. It carries brief daily newscasts and a weekday 2-hour news block (TXU), with some attention to Blacks and their activities in the United Kingdom. It, too, is carried on several satellites as well as DAB.

United States

U.S. Native American radio stations first appeared when KYUK in Barrow, Alaska, made its

debut in 1973. There was a considerable growth spurt through the early 1980s, fueled in part by civil rights protests and demands for self-representation among Native Americans. By 2008, there were 33 Native American and Inuit radio stations, not including commercial or web-based services. English is the usual broadcast language, and only a few of the stations offer news and current affairs programming in the tribal languages. Although there was some exchange of taped material starting in the 1980s, nothing resembling a full-fledged network appeared until 1994, when American Indian Radio on Satellite (AIROS) was created. AIROS plays several important networking roles: as transmitter of several 5-min newscasts per day, the 1-hour Monday through Friday call-in talk show *Native America Calling*, the radio magazine *AlterNative Voices*, and *Voices From the Circle*, a mixed news/music/current affairs/storytelling program. Funding comes primarily through government appropriations, including annual support by the Corporation for Public Broadcasting.

Native American television lacks a network service, but there are several sources of independent programs, many distributed through the Native American Public Telecommunications (NAPT) VisionMaker Video Service, established in 1997, and aired through public television stations. Most of the videos deal with current issues (for example, child abuse or alcoholism) and cultural life in Native American communities. In addition to the Corporation for Public Broadcasting and other government funding, NAPT receives support through the Ford Foundation.

Radio Bilingue in Fresno, California, came on air as a community radio service in 1980 but gradually grew to become a six-station network with satellite transmission to several dozen more stations. It broadcasts in Spanish and in a few other Mexican and Central American languages such as Mixtec, as well as offering occasional programming in Hmong and in some South Pacific Islander languages. It provides a national newscast, *Noticiero Latino*, as well as a weekday call-in program, *Linea Abierta*, which covers topics of particular importance to Latinos, such as immigration reform.

Notable Commercial Minority Networks

Commercial ethnic/linguistic minority television networks that carry newscasts are uncommon, and most are in the United States. Where they do exist, substantial increases in the size of the relevant populations and availability of satellites led to the creation of these networks.

France

One of the few minority commercial radio networks outside the United States is Radio Beur, founded in 1990 to serve a largely North African Arab population in Paris which soon established outlets in several other French cities. In addition to providing a daily 30-minute newscast that uses some material from those outlets, the station has a 1-hour talk show, *Question de Tout*, on Saturdays and Sundays. Many of the topics deal with sensitive issues such as AIDS, the “correct” way to observe the holy month of Ramadan, and anti-Arab prejudice in France. Most broadcasts are in French and Arabic.

United Kingdom

When the BBC’s monopoly on radio broadcasting was broken with the initiation of Independent Local Radio commercial services in 1973, some of the Independent Local Radio stations began to offer small segments of airtime to South Asian and Afro-Caribbean-British groups, sometimes on a group’s request, sometimes on their own initiative. The BBC local radio stations had not been particularly active in that sphere, which provided the Independent Local Radio stations with a way to distinguish themselves. However, a nationally distributed commercial Asian radio service did not emerge until 1991, when West London-based Sunrise Radio first aired on the Astra satellite. It offers informational material emphasizing South Asia life within the United Kingdom and has a four person news staff as well as a number of stringers and other informants around the country but does not have a regularly scheduled newscast. Instead, brief news inserts are included with some of the entertainment programs, especially the morning talk shows. At least one local station, Sunrise Radio Yorkshire, offers a local newscast.

United States

There are two U.S. Black commercial radio networks. Radio One, founded in 1980 and based in Lanham, Maryland, owns 54 stations in 17 cities. However, it does not provide national newscasts, nor do many of its local stations have newscasts. It provides a separate web service, Black America Web, which offers news and commentary emphasizing subject matter of particular interest to Black audiences such as Barack Obama's 2008 presidential campaign. The American Urban Radio Networks is a set of four differentiated outlets and was created from the merger of the Sheridan Broadcasting Network and the Mutual Black Network in December 1991. The American Urban Radio Networks' Pinnacle and Renaissance Networks originate daily newscasts. Renaissance also offers a daily *White House Report*, a nightly talk show dealing with such issues as prostitution and child abuse, and a daily *Health Watch*. The third network, STRZ Weekend Entertainment, and the fourth network, Sheridan Gospel Network, do not originate news and public affairs programming.

The BET has been moderately successful financially, albeit primarily as a provider of light entertainment rather than news. From its inception in 1980, BET provided 2-min news briefs embedded in the program *Video Soul* but did not initiate weekday newscasts (*Black Nightly News*) until 2001. It dropped these newscasts in 2005 in favor of "news briefs" throughout the day. TVOne, a Black-owned cable and satellite network founded in 2004, does not offer newscasts but does provide three weekly talk shows and brief news analyses. The Black Family Channel, founded in 1999 as MBC (Major Broadcasting Network), has struggled financially because of a relative lack of success in securing channels on local cable systems, and it dropped cable distribution entirely in mid-2007 in preparation for moving to broadband in 2008. The Black Family Channel has not offered a newscast, but it has aired several informational programs dealing with health and personal finances, both of which are slated to reappear when the Black Family Channel moves to broadband. A 24-hour all-news service, The Black Television News Channel, was announced in April 2008 for launch in 2009.

Univision Radio provides daily newscasts and talk shows to a 70-station network of Spanish language radio stations located in most of the major U.S. Latino population centers. The corporation did not offer a radio service until 2003, when it acquired the Hispanic Broadcasting Corporation. It has correspondents in many U.S. cities and in a number of Latin American capitals. Its two major rivals, the Latino Broadcasting Company, founded in 1996, and the Spanish Broadcasting System, founded in 1983, are less active in news and public affairs programs, but Special Broadcasting Service began a 60-min weekly network news program in May 2008.

Univision and Telemundo each offer Spanish-language newscasts. Univision began as the Spanish International Network in 1962, and its rival Telemundo began network operations in 1987. A portion of each newscast covers events taking place within the United States, some of them involving Latino events. Telemundo's commitment to newscasts decreased in 2006, when the network's owner, NBC, dropped local newscasts on six of Telemundo's principal affiliates in Texas, Arizona, and California, and replaced them with a regional newscast. Univision also provides a 2-hour morning program along the lines of ABC's *Good Morning America* or NBC's *Today*, with news briefs every half hour, and a daily magazine show (*Primer Impacto*) containing newscasts. Documentaries are rare on both networks.

Programming

It is not always easy to differentiate between informational and entertainment programming where ethnic/linguistic minority networks are concerned. For example, many of these networks produce children's programs that are replete with informational material such as tribal history, vignettes of outstanding minority group members, histories of words and proverbs, and, in a few cases such as Australia's NIRS, brief newscasts produced specifically for young viewers. Where the more or less traditional information formats such as news, live coverage of major events, commentary, documentaries, interview-based shows, and talk shows are concerned, most networks offer examples of each. The manner of presentation of these programs, however, often differs

from majority models in their slower pace, more respectful tone, and general absence of confrontational behavior.

Most network-originated newscasts include national and international news, particularly when the items contain material of specific interest to a given minority group, such as a U.S. Supreme Court decision upholding the basic right of Native American tribes to establish casinos. They also are likely to contain items about local and regional events and activities, which often are reported by local minority stations or by stringers. Reporting about minorities done by minority networks generally tends to accent the positive; when negative items such as minority-committed crime are reported, often there will be material giving some minority context to the story, for example, explaining that a particular crime is also punishable under tribal law and perhaps detailing that punishment.

Interview-based programs also are a common feature of minority networks and often take the form of talk shows, where audience members will be encouraged to join in. As a rule, interviews are conducted in a spirit of respect rather than opposition, and callers are treated collegially rather than in an adversarial way. In many of the Indigenous cultures (Sami, Native American, Maori), there will be longer pauses between questions and answers than is usual with most majority services. This protracted silence is a sign of respect. Topics vary widely, but for many minority groups, health care, high incarceration rates, respect for and rights of women, proper child care, and minority political activities appear frequently. AIROS' *Native America Calling* has been particularly successful in generating discussion on such topics as family violence, casino and fishing rights, incarceration, health care, and assisting returning Native American veterans who suffer from post-traumatic stress syndrome.

Program-length discussion shows are relatively rare, but Maori TV's weekly program *Ask Your Auntie*, popular with Maori and *pakeha* ("whites") alike, illustrates the potential utility of such a format. Four Maori women of differing ages and backgrounds respond to viewers' inquiries, ranging from personal matters such as whether to date a *pakeha* to current issues in society such as how to deal with alcoholism among Maori. While

much of what they cover could be regarded as advice, they also provide specific information about issues as well as where to obtain further information. The women move back and forth between speaking in Maori and in English, making the program more widely accessible. *Native America Calling* provides a daily forum for listener and "expert" discussion of such topics as Christianity's influence on U.S. Indian law and helping returning Native American combat veterans to readjust to civilian life. It regularly invites listeners to submit their own suggestions for topics.

Documentaries are common in many minority TV network program schedules, and a few networks, notably Canada's APTN, carry them often. In APTN's case, many documentaries are produced by the aforementioned Native Communications Societies but also by independent ethnic minority producers in Canada and other countries, especially Australia, New Zealand, and countries in Latin America. Topics include those already listed for discussions but also feature portrayals of "traditional" cultural activities such as woodworking or dancing and their present-day equivalents such as Maori song contests.

The production of cultural documentaries can be a sensitive matter, due to fear over the loss of local identity. That is a particularly delicate issue for certain forms of knowledge (usually religious or cultural) that may be seen as privileged, so that only certain individuals, families, and community groups (women, for example) are allowed to use and share them, while still retaining ownership. Some documentarians have developed codes of practice emphasizing the importance of sensitivity to such concerns. That includes the need for an interviewee to understand that, because many different kinds of audiences are likely to hear or view the program, and because those audiences may not understand the concept of story ownership, they may feel free to repeat what they hear and see without acknowledging ownership. Hosts of interview-based shows often observe the same caution.

Live coverage of events tends to emphasize minority cultural activities such as athletic, poetry, singing, and other contests, but demonstrations, major political gatherings, and commemorations, particularly when they involve minorities, also

receive attention. The funeral of the Maori queen late in 2006 drew continuous coverage from both Maori radio and TV and was considered by Maori broadcasters as a major contribution to increasing a sense of national unity among the Maori tribes. National election campaigning and the tallying of votes frequently attract minority network coverage, particularly where minorities are running for office.

There are associations for minority journalists in a number of countries, such as those for African American, Asian American, Native American, and Latino journalists in the United States; for Native American and Inuit journalists in Canada; for Maori journalists in New Zealand; and for Australian Indigenous journalists. These associations' annual meetings emphasize employment issues, usually with respect to mainstream broadcasting, but they also include discussion of ways to represent in effective and respectful ways the cultural, political, and economic activities of the minorities they serve.

Networks and "Localism"

Ethnic and linguistic minorities appear to regard networks serving their communities as a mixed blessing. Those who feel that there is strength in numbers realize that having their own networks can increase minority and mainstream public awareness of minority grievances, problems, and accomplishments. These networks also make it easier to mobilize minority and majority public opinion around such pressing issues as high minority incarceration rates; chronic health problems; issues of land ownership; cultural, economic, and educational achievements; and the importance of one's own language and religious practices.

Others worry about a possible loss of local identity, which in some ethnic and linguistic minority populations is connected with the unique language usage and cultural practices of a particular region. Broadcast networks, they fear, may lack the sensitivity to respond to these localized concerns. The centralized, top-down nature of most networks also may act to diminish the importance of local radio and television where such services exist. Networks' command of greater material resources, moreover, and their tendency to follow

professional production practices, may make the local services appear amateurish.

Because some of the networks—Maori TV, Sami, Inuit, and Radio Waatea—broadcast largely or exclusively in an ethnic tongue, the homogenizing effect that such services can have on regional and local accents and word usage is also a matter of concern in terms of maintaining a sense of place and community. Further, a network news service often deals with a range of scientific, political, public health, and other issues, for example, AIDS and counterterrorism, thus requiring terms of reference that do not exist in many of the minority languages. While the users of some languages—Maori is a notable example—have been resourceful in creating linguistically appropriate terms using words from the native lexicon, others have taken the less labor-intensive approach of using the majority term or modifying it with their own language's prefixes and suffixes. This adaptation of the language can lead some to feel that the essence of the minority language is being compromised.

Changing Technology

As minority networks evolve, they become more adept at using new technologies such as the Internet and satellites to expand their reach and enhance their effectiveness. Where journalism is concerned, many minority media operations have yet to employ satellites in ways that will bring the voices and images of local populations into network-produced and -distributed news and public affairs programs. (Popular music is a very different story, and there are many MTV-like services such as Desi TV for South Asian viewers around the world.) However, there are some already-noted examples of such efforts, such as the AIROS satellite service's *Native America Calling*, APTN's *Contact*, Radio Bilingue's *Linea Abierta*, and NIRS's *Let's Talk*. Because each of the host nations is vast and features Indigenous populations that are widely scattered, the satellite is the only technology that enables real-time participation for a sizable share of the target audience. Satellites have also been crucial to the development of national audiences for the BBC Asian Network, Sunshine Radio, Radio Beur in France, and others. They even have made possible the development of

mini-networks for specific groups, such as a three-station “network” (Little Saigon Radio) that offers daily newscasts containing items on Vietnamese American life from each of the stations.

Network websites increasingly feature interactivity. Australia’s NIRS, for example, solicits contributions of news items from listeners through the Internet. The Internet and satellites also may hold the key to the creation of a long-awaited international network linking ethnic and linguistic minority broadcast services around the world. Sami Radio in Norway is coordinating the effort to involve as many groups as possible. It remains to be seen what sorts of services minority networks may make available for users of iPods and similar mobile devices, although several of them, such as NIRS, are already offering podcasts and other downloadable audio and video material.

Notwithstanding the present and potential obstacles minority networks face—budgetary, but also the need to make themselves visible in a rapidly expanding media universe—they appear destined to grow in numbers and in reach thanks to the greater availability and affordability of newer communication technologies, satellites and the Internet in particular. As one example, the Latin American Indigenous Broadcast Network Red Quechua Satelital uses a combination of email, web radio, and satellite transmission to link 28 Quechua/Quichua language media services, which provide news and radio magazines to some 12 million of their speakers in Ecuador, Bolivia, and Peru. Given the mountainous areas in which that population lives, it would have been impossible to develop a terrestrial network to reach it. Whether the possible loss of local dialects, privileged knowledge, or purity of language is offset by possible gains in the strengthening of the larger community through such networks is a question that can only be answered by those ethnic and linguistic minority communities that are directly affected by such developments.

ETHNIC PRESS

This entry discusses historical developments of the ethnic press in the United States along with its uses and functions and its relevance beyond the United States. It concludes with a discussion on the emergence of digital ethnic media.

Any conversation about the ethnic press entails a complicated web of stories directly tied to the migrations of people, the development of diasporas, and the political and social constructions of race and ethnicity. This entry, thus, is informed by histories of racial and ethnic formations—the social and historical constructions of race and ethnicity—diasporic studies, and geopolitical contexts. Furthermore, while the entry focuses on the ethnic press in the United States, it is crucial to highlight that these media organizations have existed around the world during different historical periods. As such, this entry defines ethnicity (and race) through a U.S.-specific lens, while acknowledging the global presence of such categories.

Historically, scholars have referred to the ethnic press as print newspapers that circulated outside of mainstream news media and were published by non-Anglo-Saxon and non-Anglophone communities (except for Irish publications that printed in

English). Scholars writing on the ethnic press have primarily focused on those publications that represent non-Anglo immigrant communities, a designation that assumes that Anglo-Saxons are nonethnic populations. These assumptions not only have ethnic identification implications but also racialized ones.

Any discussion about ethnic communities in the United States can also be traced to the evolution of race, particularly whiteness. The historiography on ethnic and racial evolution illustrates that Anglo-Saxon populations in Europe and in the United States *became* white through the acquiring of economic, cultural, and social power—while other European ethnic groups would be perceived as the “other” (e.g., Italian, Irish, Jewish, and Eastern European populations). In the United States, however, many (though not all) of those non-Anglo-European communities that were initially perceived as the “other” eventually became white through the accumulation of capital (i.e., power). Because ethnic media has been directly tied to non-Anglo immigrant populations, this entry focuses on non-Anglo ethnic media.

It is important to acknowledge that ethnic Anglo-Saxon people who became associated with whiteness over time also migrated and colonized the Indigenous land that today is known as *the United States*. Because Indigenous media do not represent immigrant institutions, some research has distinguished them from ethnic media. Yet, other scholars define the ethnic press as the institutions that produce for members of a particular ethnic group; this characterization includes Indigenous media. This entry then expands the definition of ethnic media to include both immigrant and Indigenous media.

Before further defining and historicizing the ethnic press, one must define ethnicity. *Ethnic identification* refers to a process by which individuals are tied to a particular common language, history, and geographical place. Ethnicity is the outcome of structural and individual organizations that shape ethnic categories and definitions. People might identify with a particular ethnic background, but these identifications are also shaped by institutional forces (e.g., nation-state governments). These categories, furthermore, constantly evolve through external social, economic, and political developments. In other words, ethnic

identifications can change over time. For example, while many Indigenous communities in the United States have struggled to preserve their cultural customs, languages, land, and overall livelihoods, some Latinx or non-Anglo-European communities have sought to assimilate into the dominant cultural contexts surrounding them.

Ethnic media then refers to those media establishments that are tied to a particular ethnic community (e.g., Latinx-owned and/or Spanish-speaking newspapers). The ethnic press has become particularly relevant in urban cities (though not exclusively), where immigrant communities have long seen the power in shaping their own communities via print. Ethnic groups have established these media institutions for various factors, including the aim to ease immigrant individuals and communities’ transitions into American society. Thus, the ethnic press has served as a vital function for individuals arriving to the United States from various parts of the world. For this reason, scholars have examined the ways in which migrant communities have established media organizations, community uses of available outlets, and the historical functions that such media have played in ethnic communities.

Historical Developments

The early 19th-century Black press in the United States served similar functions as those established by non-Anglo ethnic communities, but for formerly enslaved individuals forcibly transported to the United States from their homes in Africa and for the descendants of enslaved individuals. Black publishers sought to provide representations of Black North Americans that challenged racist stereotypes prevalent in mainstream news. Black-owned newspapers also sought to promote emancipation and educate their communities.

Despite the many Black-owned newspapers that have been published in the United States, the ethnic press has often been referred to as the *foreign language press*. This designation also has not necessarily included print media written in Spanish during the colonial period in the geographical areas colonized by Spain and later owned by Mexico, nor has it included Indigenous-owned and produced newspapers. The ethnic press is often traced to print media published during the

colonial period in the United States by German, Irish, and other non-English-speaking immigrants who arrived in the geographic area of the northeast. But current understanding of the ethnic press has expanded to those diasporic communities that have ties to Latin America, the Caribbean, Asia, Africa, and Indigenous nations that have inhabited lands long before Europeans colonized them.

The first Anglo-Saxon immigrants colonized Indigenous lands in the United States during the early 1600s. Waves of immigrants (who voluntarily or involuntarily emigrated across the Atlantic Ocean) from Northern and Western Europe established their own communities in cities such as New York beginning in 1815. Many of these newly arrived immigrants came from Ireland. For instance, between 1820 and 1930, approximately 4.5 million Irish people and 5 million German immigrants arrived in the United States.

Ethnic establishments by Asian, Latin American, Caribbean, African, and other non-white immigrant communities also were common during this period. About 25,000 Chinese immigrants migrated to the United States by the early 1850s. By the late 1890s, millions of immigrants came from Eastern and Southern Europe, including Italian and Jewish migrants. Such movements created what scholars call *diasporas*—communities of scattered people whose origins are tied to a single homeland but are dispersed throughout the world (e.g., African American populations, Latinx and Caribbean immigrant communities, Jewish people, and Asian populations). In many of the voluntary migrations, a pattern has emerged: Migrant people from their native colonized or formerly colonized country travel to the empire (the nation-states that continue to colonize or once colonized their homelands).

Globalization processes throughout different historical periods have influenced people to leave their homelands and to arrive in places that they believed would provide them better economic opportunities. Many immigrants also fled because of religious and ethnic persecution. For instance, more than 2 million Jewish people migrated to the United States between 1880 and 1920. Legislation beginning in the late 19th century also curbed immigration entry, in part due to efforts to preserve the Anglo-Saxon “white race.” Nonetheless, the 20th century saw additional ethnic

populations arrive from the Caribbean and Latin America. For instance, the Cuban Revolution of 1959 would lead thousands of Cubans to arrive in the southeast region of the United States. Central American migrants settled across the United States throughout the latter years of the 20th century. This migration included those fleeing economic depressions and civil wars (covertly funded by the U.S. government) in El Salvador, Nicaragua, and Guatemala.

But just as legislation curbed immigration, legislative reforms introduced in 1965, 1985, and 1990 brought more immigrants to the United States. As these immigrant communities grew throughout the 19th and 20th centuries, publishers from particular ethnic backgrounds began to offer local readers free newspapers written in their native languages. Social, political, and cultural contexts not only played significant roles in shaping the lives of minoritized ethnic groups—the process in which some populations are structurally stripped of power and become constructed as the repressed other—but also the rationale and manner in which ethnic communities developed newspapers. Technological developments, for instance, offered immigrant and Indigenous populations access to information. The first printing press in the Americas emerged in Mexico City in 1535 or 1536; the Catholic church and European colonists, however, were the primary producers and audiences. Eventually, ethnic communities developed tools to speak back to power structures.

For instance, the first Black newspaper in the United States appeared in 1827, when formerly enslaved and free-born Black intellectual elites began to establish their own newspapers (e.g., *Freedom’s Journal*) to fight for emancipation. The earliest ethnic media appeared in 1808, with the publication *El Misisipi* in New Orleans, Louisiana. The newspaper served the Spanish-speaking immigrant communities escaping war in Europe and Latin America.

First nations (or Indigenous nations) began publishing in 1828. The *Cherokee Phoenix* was one of the first Indigenous newspapers to publish bilingual print issues. Chinese American newspapers appeared toward the latter part of the 19th century, with *The Golden Hills* published in San Francisco in 1854. The newspaper sought to

counteract the harsh treatment of Chinese miners during the Gold Rush. The 20th century's world wars led to ups and downs for German-language, Japanese American, and Jewish media, as the presence of such media reflected larger national legal, cultural, and political climates. The history of ethnic media, then, cannot be told without an understanding of the larger political and developmental contexts of nation-states. Moreover, it is key to understand the ethnic media as not monolithic, but as complex and evolving institutions that have served a variety of purposes.

Functions, Uses, and Content

Ethnic media across immigrant groups may convey different purposes, offer varying content, and adopt various processes for reporting and distributing. Socially constructed categories of race/ethnicity, gender, class, religion, and sexuality, as well as cultural influences may shape these different approaches. As such, the term "ethnic media" has been deconstructed in ways that illustrate how hierarchies (e.g., racial and gendered) might become more pronounced. Furthermore, while scholars have frequently depicted ethnic media as the alternative to mainstream outlets, it also is important to acknowledge their complex, and changing functions and uses. There are, however, foundational similarities highlighted in existing scholarship.

One aspect of media is to function primarily as a tool for social control. Media play a significant societal role in highlighting what is acceptable within the context of dominant norms and values of a community. This community can represent the larger national community or a more local formulation of the community. Like national mainstream media, the ethnic press can serve as a mechanism for surveilling communities, socially constructing cultural heritage, promoting mobilization within a community, and offering entertainment. Because ethnic media are often tied to smaller geographical spaces and represent mom and pop businesses, they can also be referred to as *community media*. Many are weekly papers, print in native languages, and are free to the community.

Culturally, ethnic media may also see it necessary to promote assimilation, the process in

which a minoritized group adopts the cultural practices of the dominant one. For instance, some research has found that increased exposure to Anglo media in Latinx communities may decrease individuals' exposure to Latinx-owned or Spanish-speaking media. Thus, some communities may assimilate in relation to dominant Anglo cultural practices.

Despite the role that some ethnic media play in promoting assimilation, research suggests that these institutions help individuals sustain ethnic ties. In addition to an assimilative function, some ethnic media outlets have employed pluralistic expressions, where groups may simultaneously participate in particular cultural practices and in dominant society. How local audiences then use ethnic media varies, with some communities opting to assimilate into the dominant culture while others develop stronger ties to their ethnic identities. Furthermore, such institutions can play pivotal roles in helping newer immigrant residents adapt to their geographical and cultural contexts. Community ethnic media may also play the role of a watchdog against external threats (e.g., civil rights violations, immigration laws, and human rights crimes against individuals). Some also take on an activist role, where they may seek to politically mobilize their readers.

Community ethnic media usually focus on reporting about community events, providing human interest pieces (though not always exclusive of political stories), presenting successful immigrant stories, and providing everyday information to their communities. Local community audiences also engage with a variety of news content. In ethnic media, they may read news about their home countries as well as local, geographic-specific stories that might help them further develop their sense of community. Thus, what is considered "local" can be constructed as a fluid and relational space. In other words, ethnic newspapers may provide a space that is simultaneously global and local. In turn, ethnic communities might perceive both their native land and newer home as "local." This geographical trend is even more apparent in those media institutions that have moved beyond the realm of one local space by becoming a multinational enterprise that reaches audiences across nation-state borders.

Ethnic Media and Transnational Communities in the 21st Century

Since the advent of the World Wide Web in the 1990s, the development of ethnic media has spread even more rapidly, despite 20th-century predictions that such newspapers had reached a peak in the 1930s. Factors that have altered the media landscape include emerging technological tools, the global political economy of media, immigration movements, and the visibility of hybrid communities. Digital media can function as diasporic mediums, where individuals can connect and share information across borders through websites, online streaming services, social media, blogs and vlogs, and the larger emergence of niche alternative media platforms.

The rise of a participatory media culture is not new for ethnic media, since these organizations have always engaged within hyperlocal contexts. It is debatable whether digital ethnic media have impacted their targeted online and offline audiences, due to the complex nature of emerging technologies. But this question underlies many scholarly and public arguments about the promises and challenges of digital media.

Digital media have allowed news and other forms of communication to travel more rapidly and across physical borders more easily. With the Internet, immigrant communities around the world can more easily receive information about their homelands. Additionally, digital media have offered communities traditionally left out of mainstream spaces more affordable means for distributing, producing, and communicating to niche audiences. For immigrant communities, this technological development has meant that more individuals are able to produce and access information that is directly related to their lives. Thus, while the spread of digital technologies might be negatively impacting the existence of traditional mainstream newspaper organizations—especially local news organizations—the appearance and distribution of ethnic media organizations has rapidly increased. As some research has suggested, ethnic media benefit from the digital age as they are well positioned—though not alone—to accommodate niche markets, or audiences.

The digital age has transformed how younger generations are increasingly participating as

“prosumers” in physical and online spaces. While the concept of “prosumer” means that the line between producers and audiences has increasingly become blurred as digital users not only consume information but also produce it—often for advertising purposes—via various channels, it also means that marginalized voices unheard in mainstream spaces are now able to speak back to power structures in a more rapid and expansive way. Because of the affordances of digital ethnic media, younger generations of people who identify as hybrid individuals—those who grew up in the “new” land that their parents migrated to—are joining established ethnic media organizations. Thus, the availability of digital media means that no longer are first-generation immigrants the only audiences of ethnic media organizations. In fact, some evidence has suggested that non-white communities often prefer ethnic media over mainstream ones. In addition, while transnational flows of people and commodities have always existed, digital media has arguably accelerated the development of transnational communities, as people are more easily able to connect across physical borders.

Various research studies also have suggested the need to critically examine celebrations of digital media employment, including its potential for popularizing activism. More often than not, social hierarchies are recreated online. In other words, whose voice is actually “heard” depends on a variety of social, political, and cultural factors. Ethnic media organizations, as such, must speak into the digital void in hopes to be heard.

In convergence culture, where boundaries between media production and consumption are blurred, it has become much more readily apparent that using certain online services involves relinquishing privacy rights to government and corporate entities. Critics, thus, argue that the idea that participatory or convergence culture invites audiences to democratically participate in Western civil society is shortsighted at best, with national and corporate interests ultimately regulating citizens’ uses and experiences. Furthermore, questions of access remain. While some studies indicate that ethnic communities have more affordable opportunities to participate as media producers online, scholars have also raised concerns about the digital divide. As media diversity

is being couched within market terms, public policy has focused on choice rather than racial and gender inclusion. With technological convergence increasing, deregulation has drastically affected who has access and who is visible in the digital sphere.

While it is important to note the ways ethnic media help marginalized immigrant communities navigate their local spaces, with digital media come other political challenges. With the rise of nationalism serving as an anti-globalization reaction, the question of virtual nationalism within diasporic digital communities must also be raised. Some diasporic communities may participate in both nonviolent and violent efforts to connect with their homelands, in turn resulting in individuals' deep identifications with those nations. Digital media then do not necessarily result in what some scholars have called *deteritorialization*, the elimination of borders. Instead, borders continue to be reflected, reconstructed, and reinforced online.

While ethnic communities may utilize digital media platforms to elevate their voices, they may also be further marginalized and targeted. Vulnerable ethnic communities, such as undocumented immigrants, often experience violence targeted toward them online. For instance, many individuals have "come out" as undocumented on social media. This process can help create community among undocumented immigrants while also placing these individuals at higher risk for being surveilled and harassed.

Emerging technologies have sometimes been described as *borderless*, but they may actually recreate imagined borders; online communities reconstruct cultural, political, and national boundaries online. This argument, however, can be made of native-born communities that make up the dominant population in a particular national context as well; in other words, digital media can reflect (not necessarily change) offline political dynamics, with nationalist calls to maintain rigid cultural boundaries having become prevalent online. Ultimately, while digital media have offered unprecedented opportunities to ethnic communities, barriers and challenges to democratic participation in society remain prevalent.

EURONEWS

Euronews is a pan-European news channel aimed at supporting the larger concept of a European identity. Although it is probably the most international and transnational news project in European history, it is not the first one. This entry discusses the history, primary purposes, and recent expansion of Euronews.

History

Transnational media can be traced back to at least the 18th century when an international news network disseminated news across the continent. Before then, some of the news pamphlets published in cities like Amsterdam and Antwerp in the 17th century were translated and exported to other European markets, including England, France, and Spain.

However, it was not until the 1950s that the first official attempts to promote a pan-European news channel took shape. This followed the creation of the European Common Market, as policymakers and broadcasters began to explore the possibility of starting a television channel that could strengthen a common European identity. Later, in the mid-1980s, the European Commission underscored the importance of information

in order to promote a European identity, although it was not clear whether this should be shaped as a news channel or a more general television network. Initially, since the Common Market was conceived as a free trade area, the creation of a European television channel raised some questions as to whether this entailed some type of protectionism. In fact, some governments (particularly the French one) believed that European culture had to be protected from the influence of U.S. media companies and enforced a quota of national and European media products in their countries.

In line with this, the European Broadcasting Union (EBU), a consortium of public media organizations founded in 1950, played a crucial role in the creation of Euronews. One of the advantages of this organization, whose main success in the early years was the simultaneous broadcasting of cultural events through Eurovision (the television network that organizes the Eurovision Song Contest), is that it looked beyond the borders of the members states of the original Common Market. In fact, it gradually incorporated television companies from Middle East countries as well as the former Soviet bloc. This would eventually have important implications for the foundation and consolidation of Euronews as regards the languages used and the companies involved in the project.

In the 1990s, and after the launching of Skynews and other Anglophone channels, the EBU focused on two genres: sports and news. The early attempts to use English as an international language of news dissemination in television channels, such as Skynews, had proved unsuccessful: not only were they politically incorrect by assuming that everyone could (or even should!) understand English, they also ignored the fact that most Europeans wanted to be informed in their own language. Thus, Euronews started broadcasting in 1993 in response to the appearance of Anglophone news media that offered an Anglo-American view of world events and to the international success of CNN in particular. In fact, CNN's 24-hour coverage of the Persian Gulf War in 1992 is believed to have prompted the EBU to create Euronews.

Based in Lyon, France, the initiative was supported mainly (but not only) by European public

broadcasters, including those of Belgium, Cyprus, Finland, France, Greece, Italy, Monaco, Portugal, and Spain as well as Egypt. As Euronews was controlled by a commercial company (Générale des Eaux) together with the original 18 members of the EBU, the project resulted in a multilingual system of distribution of images rather than in the creation of a truly European news service. For this reason, it was assumed that the fact that Euronews had 11 bosses would contribute to its independence from political influence. Later, other companies from 14 countries joined the consortium, including European states such as Malta, Slovenia, Sweden, and Switzerland as well as others in the Mediterranean region such as Morocco, Tunisia, and Algeria. Euronews started broadcasting in English, French, German, Italian, Spanish, and Portuguese. However, as mentioned, initially images were the cornerstone in the development of the channel and, in fact, became the only common language for Euronews viewers.

As the number of stakeholders grew, other languages such as Russian, Arabic, Turkish, Persian, Ukrainian, Greek, Hungarian, Georgian, and Albanian were added. Paradoxically, during the period 1997–2003, an Anglophone medium, the British private company ITN, became the main owner of Euronews, while in 2008 Spain's state television RTVE, which had been one of the promoters of the channel, left Euronews to promote its own news channel in Spanish. These changes, as well as the partnership with NBC in the United States, impacted the original characteristics of Euronews. The English programming was revamped, and changes also affected the different language editions. As of 2020, Euronews has 12 cross-platform channels, nine of which are distinct television channels.

Purposes

One of the purposes of Euronews was to report on events originating in Europe, since Anglophone channels did not specifically focus on European issues. As images were the staple diet of the channel, originally Euronews did not use anchors. This allowed the different participating broadcasters to share material, which was then adapted for the respective target audiences. For

this reason, in the 1990s and early 2000s, reporters were rarely seen on screen. In addition, many reports were and still are retransmissions of national programming adapted for European and international audiences, which can choose, for example, to watch a program about Germany in French.

These and other production characteristics have led some researchers to use Euronews as an example of “low-cost journalism” (Vindenness & Gynnild, 2020). This, however, is changing as Euronews has hired new correspondents, who are based in several European countries as well as in the United States. In addition, a number of shows are conducted by anchors. As of 2020, Euronews claims to have a team of 500 journalists of 30 nationalities. These features are subject to continuous changes: from 2020 the main stakeholder of the company is the Egyptian Media Globe Networks.

Given the specific nature of Euronews, translation is a central component of the channel, which needs to provide multi-language versions of any given news item on a daily basis. Translation often involves adaptation to the peculiarities of every language: German and Spanish, for instance, and to a lesser extent French, require a greater number of words than English. However, this is not the only difference between the many versions of the same news report. Unlike the widespread view among journalists that translation involves the word-for-word transfer of a source text into a target language, translation should not be understood as literal transfer, but rather as cultural adaptation aimed at meeting the expectations of the target viewers as well as the journalistic conventions of the target languages. For example, in the six versions of the Mumbai’s 2008 terrorist attacks reporting, the story changed not only in terms of the languages used but also in terms of content: the English version concentrated on the British nationals wounded or killed in the attack, the Spanish one reported on Spanish citizens, and the Italian version mentioned two Italian girls. For this reason, it could be argued that Euronews tends to provide a multi-localized rather than a European perspective of world events.

Although Euronews is the longest running pan-European channel, it has only been partially

successful, as the numbers of viewers has remained low. This does not mean, as has been suggested, that this audience should be neglected, even more so at a time when the rise of populist movements is putting the European project at risk. In fact, the official webpage of Euronews continues to emphasize the original mission of the enterprise thus: the channel aims to provide unbiased reporting with “a European DNA.”

Expansion

Euronews has franchises in Albania, Georgia, and Serbia. In addition, in 2012 Euronews started a radio service and in 2016 it launched Africanews, a sister news channel based in the Congo, which broadcasts in English and French. Euronews can also be watched on mobile devices via a free application available on Google Play and the App Store.

EUROPE

Europe, the second smallest of the world's continents, comprises 44 countries, including the United Kingdom, Spain, Russia, France, and Germany as well as Hungary, Belarus, Serbia, and Switzerland. Russia is the most populous region and has nearly 15% of Europe's total population. Europe today has some of the most innovative media organizations like the Dennik N in Slovakia; Deutsche Welle, the German public state-owned international broadcaster; the Swedish Dagens Nyheter; Mediapart in France, and the BBC in the United Kingdom.

With multiple countries, numerous languages, and different ways of life, Europe may seem like a complex maze of culture and politics. Media in Russia, for example, are mostly state-run or owned by companies with close links to the Kremlin. Unlike other European countries, Belgium may not have a single public broadcasting organization but its diverse French, German, and Flemish populations are served by different private and public media companies. Like in Belgium, media in the city of Brussels reflects its diverse populations and cultural communities control programming rather than federal authorities.

Scholars have emphasized that biased approaches that considered the Anglo-American model of journalism as the ultimate way to practice journalism have led to scholars portraying the European model of journalism as regressive and old-fashioned, a model of how journalism should not be practiced. The Baltic, Central, and East European countries follow general Western ways of journalism practice. Hungary is an exception, and its media have been described as partly free by Freedom House, a nongovernmental organization that conducts research on media freedom. Media in Italy have journalists, close to politicians, functioning as advocates for parties and interests they have strong links to. For journalists in Europe, objectivity and political neutrality are hard, given the fragmented situation where political and social forces are closely linked and where even the slightest meaning assigned in a news narrative may imply leaning toward one or more political forces and opinion in the field.

After reviewing the origins of journalism in Europe, this entry discusses the nature and state of journalism in Europe in the 21st century.

Origins of Journalism in Europe

Unlike journalism in the United States, journalism in Europe has strong roots in the literary world where, for example, influential journalists during 19th-century France were novelists, such as Victor Hugo, Honoré de Balzac, and Emile Zola. The word *journalism* has French origins: "Jour" means daily in French, and its usage originated during the French Revolution when newspapers were extensively used and often the only way to shape public opinion. The professional description of the word *journalist* has been attributed to the *Journal of Sçavans*, published in Paris in 1665. In England, the profession was a familiar one in the 18th century. Thus, Europe has often been considered the birthplace of journalism. The end of the 18th century saw consensus of what journalists did and the term *journalist* gradually replaced more general nomenclature like *Zeitungsschreiber*, which meant "newspaper writer" in German or the Italian *novellante*, which means novelist or writer.

The newspaper as it is known today was not long in coming. Around 1601, in France and England, single but long news accounts were published. A similar type in Spain called *relaciones* was popular. In Italy and Germany, similar copies were circulated among different groups. Around 1600, the idea of using printing for such material grew in Germany. The development of the printing press in Germany and the growth of education in the 19th century gave fillip to the press that is seen today. As access to education grew and materials for publishing became cheaper, political parties started sponsoring newspapers at national and state levels. The invention of automatic typesetting in the 1880s made publication of morning newspapers possible. Entrepreneurs entered the field, nudging out political parties and ensured that the press became a business enterprise. By 1815, magazines were flourishing in Paris and Germany as well as other European countries. In Germany after World War I, the 1874 Reich press law and social developments gave rise to a press where opinions were valued and where corporate interests also worked on influencing editorials.

Nature of European Journalism

Journalistic styles, forms, and roles are influenced and shaped by the society, politics, and culture within which the profession is understood and practiced, and this is reflected in the journalism and journalistic institutions in Europe where press freedom is a priority. Journalists in Europe, more than in other countries, work in permanent positions. Europe supports rich traditions of internships and journalism education. Journalists in Western Europe may not have as much editorial autonomy as journalists from the Netherlands, Latvia, and Estonia, but recent trends including reducing excessive negativity in news and moving toward more constructive reporting. In 2020, despite the coronavirus pandemic, many Europeans considered climate change a major threat, but most European media did not have clear policies to cover the topic. The European Journalism Observatory with six partners comprising the Czech Republic, Germany, Italy, Poland, Ukraine, and the United Kingdom has criticized media in Europe for not having a clear editorial policy on covering climate change.

State of Journalism in Europe

Like other countries in the world, journalists in Europe face harassment, financial troubles, online trolling, and other assaults. Media freedom is enshrined in the Charter of Fundamental Rights of the European Union (EU) and the European Convention on Human Rights but as the European Federation of Journalists, the largest organization of journalists in Europe, say that, journalism in Europe is under threat from authoritarian governments, changes in organizational structures, and revenue streams that may not always be effective. Appointed in 2019, the European Commission, established during European elections, and in accordance with recommendations from Reporters Without Borders, is focusing on ensuring a safer professional atmosphere for journalists. This is an executive branch of the EU and its duties range from proposing and implementing legislation besides upholding EU treaties.

This has come in the wake of increasing censorship in certain countries like Hungary and Poland.

In Poland, restrictions on the judiciary have inhibited press freedoms and journalists can be imprisoned for defamation for years. The coronavirus has further complicated the scenario, especially in *Eastern Europe*. *Eastern Europe* is formed by countries like Cyprus, Georgia, Armenia, Belarus, Bulgaria, and Greece, among others. Prime Minister Viktor Orbán in Hungary assumed full control of the government citing the coronavirus and has enacted laws that give Hungarian courts the means to pressure independent media. In 2020, Montenegro and Albania lost two places on the Freedom Index, to 105th and 84th place, respectively, after journalists were unfairly detained under laws designed to fight misinformation. In Bulgaria journalists who are prolific government critics, such as Silvia Velikova, have been arrested, which has emphasized the lack of freedom in the sphere of public broadcasting.

In France, media freedom is high, but journalists routinely face police harassment. During the 2018 Yellow Vest Protests, reporters were attacked by angry protesters and police armed with tear gas. Murders are not uncommon. Slovakian journalist Ján Kuciak and Daphne Caruana Galizia in Malta lost their lives in the line of duty. In Ireland, Lyra McKee was killed in 2019. Her death prompted the establishment of the National Committee for the Safety of Journalists by the UK government to create and implement a national action plan of safety to protect journalists and hold those who threaten reporters accountable. Recently, the European Parliament passed the whistleblower protection framework which was formally adopted to serve as important legal protections for investigative and public focused journalism. Approaches outlined in the Code of Practice on Disinformation executed by the European Commission, and the statutory network provisions in the German Network Enforcement Act have been considered but critics say that they may not make a real difference to stem issues.

Thus, the Platform to Promote the Protection of Journalism and Safety of Journalists (2019) has said that media freedom in Europe is under extreme threat with countries like Hungary and Poland precipitously losing ground since 2015. For example, the media in Russia are diverse with state-owned as well as corporate-controlled entities, and while the constitution does provide for

press freedom, the government covertly exercises censorship through the application of various laws and bureaucratic decrees. Even in stable societies like Norway, journalists face numerous instances of online harassment. Sweden, Denmark, and Finland, who rank highly in the Freedom Index, also battle online aggravations.

A 2019 report from Reuters Institute for the Study of Journalism states that for journalism to thrive in Europe, organizations and journalists need “freedom, funding, and a future.” The report also recommends that media organizations must embrace the promises offered by mobile and digital platforms that are gradually being embraced globally and to refrain from championing a non-digital print-oriented past. But financial issues have stymied efforts.

Media Ownership

The European debt crisis from the end of 2009 has brought about financial crises that have significantly affected the press in Europe and have led to concentrations of media ownership which threaten the existence of independent journalism. In Slovakia, the Penta Investments, a financial group, within a decade has taken over many print and digital media outlets. Petr Kellner, the wealthiest man in the Czech Republic, recently bought the Central European Media Enterprises, giving rise to concerns of increasing influence by Central European Media Enterprises which already owns many television stations in Eastern Europe. This is seen in Bulgaria as well, where the New Bulgarian Media Group increased its hold into the market, extending control over six newspapers and much of the print media distribution grid. The Union of Publishers in Bulgaria has raised concerns about its negative repercussions on media freedom and the functioning of independent media in the country.

Revenues have declined and the European newspaper industry has lost an estimated €33bn in 2019. This has led to cutbacks by media organizations that have negatively impacted investigative, development, and science journalism. The move toward digitization has effected a greater concentration of ownership in the media and in the process influenced media plurality. While there are concerns about this centralization of media

and media ownership, there is also hope that digitization will also lead to greater access of information among the public and in the process increase diversity. The general focus of Europe’s media has been national markets. Yet certain companies have grown and moved beyond national borders, which has led to concerns about weakening public service broadcasts and an increase of profit-oriented media programming.

These are important issues to consider because media in Europe are defined by public faith in public broadcasting. As Pew Research (2018) has shown, in countries like Sweden and Germany public media are greatly trusted with 39% of Swedes choosing SVT/Radio and 37% of Dutch adults naming Nederlandse Publieke Omroep as their broadcaster of choice. In the United Kingdom, 48% adults choose the BBC. The Pew Research report also shows that Italians (65%) and Spaniards (57%) while preferring public news media trusted them to a lesser degree.

Europe has its share of dominant media conglomerates. In 2016, the European Audiovisual Observatory reported that Liberty Global, Deutsche Telekom, Orange, Sky, Viasat and Vivendi are among the 15-strong group that dominated television in the EU. To beat CNN’s coverage of the Persian Gulf War in 1992, the European Broadcasting Union established Euronews to showcase news from European angles. Egyptian billionaire Naguib Sawiris is a primary majority owner.

This scenario is also dominated by U.S.-based media channels like 21st Century Fox, AMC Networks, Discovery Communications, and NBC Universal. Bertelsmann is among the top 10 global media groups operating in Europe. The Luxembourg-based RTL Group is another international media company that as of June 2021 operates 67 television channels and 38 radio stations in Germany, France, and other European countries. In the publishing scenario, Gruner + Jahr, headquartered in Hamburg, Germany, is among the largest. There is no specific legislation in Europe that controls or tries to mediate media ownership.

Community Media

Europe is no stranger to concepts of community media and EU audiovisual regulation recognizes

the importance of diversity and ethnic inclusivity. The European Council recognizes the importance of community media as an important venue of content rooted in regions and supports its inclusivity and ability to encourage intercultural dialogue. The Council of Europe is an important public space that seeks to facilitate the collection and dissemination of information on serious concerns about media freedom and safety of journalists in Council of Europe member states that are guaranteed by Article 10 of the European Convention on Human Rights. Its partner organizations include Reporters Without Borders, the International Federation of Journalists, the European Federation of Journalists, and the Association of European Journalists.

As Europe becomes increasingly diversified, the Council of Europe's study *Spaces of Inclusion—An Exploratory on Needs of Refugees and Migrants in the Domain of Media Communication and on Responses by Community Media* (2018) has explored media use and need of migrants and refugees. As the study has shown, community media spaces can provide for different opportunities of self-representation through various formats and encourage their inclusion in local media. There is also awareness that such media in many communities lack legal recognition, funding, and participation. The European policy agenda is very cognizant of the roles played by such media and recent debates in the Council of Europe and the European Parliament have focused on developing frameworks that will enable the growth and development of such media. But critics say that inconsistent efforts are slowing development and that more sustainable regulation needs to be put in place. The Netherlands, Switzerland, Hungary, Ireland, and the United Kingdom recognize community media as a distinct third sector of broadcasting, as important media that is a welcome addition to commercial and public service media.

Important Changes

In Europe over the years, certain important positive changes are influencing journalistic practices. Most European newsrooms are still run by predominantly white middle-class men. Diversity and

gender disparities were, for long, important areas of concern. Studies done in 2015 showed that 41% of reporters and presenters in Europe were women. Print had the smallest percentage of women with 34%. In 2018, surveys revealed widespread gender-based discrimination, as well as a lack of opportunities and high instances of sexual harassment and bullying. Organizations and states were extremely reluctant to address the issue. But by 2019 many more women are now journalists in Europe with important increases marked in states that were formerly a part of erstwhile Yugoslavia and the USSR. Women made up more than 60% of the workforce in Latvia, Russia, Bulgaria, Romania, and Moldova, and more than 50% in Estonia, Croatia, and Serbia.

But media in Europe are facing new challenges. As the European Federation of Journalists has reported, rising digital shifts in the media sphere in Europe has brought about increasing pressures on traditional business models. Ensuring accessible training and protecting fragile media freedoms is clearly a pressing need so as to safeguard independent journalism and increase public trust in media.

EUROPEAN PRESS REGULATION

European press regulation is dynamic because it is conducted at multiple levels, through international, regional, and national authorities, usually in association with civil society groups, intergovernmental monitors, and press councils. They all play, in their own ways, important roles in defining the freedoms of speech and press in Europe, in addition to the restrictions allowed on those freedoms—and the privileges that journalists enjoy in their newsgathering and publishing activities. Although the regulatory landscape is rooted in the understanding that a free press is essential to democracy, other public and personal interests are weighed in the balance. This entry provides an overview of the many actors, legal sources, and theories involved in European press regulation.

International, Regional, and National Instruments

The freedoms of speech and press are fundamental human rights recognized by various international, regional, and national instruments. They set minimum standards for those freedoms in Europe and beyond, although their protections differ facially and by how they have been interpreted by courts and other tribunals. The instruments generally articulate the rights to communicate and receive information, on the theory that they are necessary to a well-functioning democratic society. They help secure other human rights, and they facilitate individual fulfillment, political accountability, knowledge discovery, and the achievement of a civil society that is dynamic and stable.

The most significant international instruments are the Universal Declaration of Human Rights, proclaimed by the United Nations in 1948, and the International Covenant on Civil and Political Rights (ICCPR), adopted by the United Nations in 1966. The most significant regional instruments are the European Convention on Human Rights

(ECHR), drafted by the Council of Europe in 1950, and the Charter of Fundamental Rights of the European Union (CFR), proclaimed by the European Council in 2000. They all contain provisions guaranteeing the freedoms of speech and press. Meanwhile, a wide variety of states have enacted national instruments that do the same.

International Instruments

Article 19 of the UDHR, which is not legally binding but has come to influence enforceable laws, states: “Everyone has the right to freedom of opinion and expression,” including the “freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.” Article 19 of the ICCPR, which is legally binding and obligates all ratifying countries to safeguard speech and press rights, states: “Everyone shall have the right to freedom of expression,” including the “freedom to seek, receive and impart information and ideas of all kinds, regardless of frontiers, either orally, in writing or in print, in the form of art, or through any other media of his choice.”

Regional Instruments

Article 10 of the ECHR, which is legally binding on its parties and interpreted by the European Court of Human Rights (ECtHR), states: “Everyone has the right to freedom of expression,” including the “freedom to hold opinions and to receive and impart information and ideas without interference by public authority and regardless of frontiers.” Article 11 of the CFR, which is legally binding and enforceable through the European Union (EU) courts, provides the same protections as the ECHR, with this addition: “The freedom and pluralism of the media shall be respected.”

Negative and Positive, Not Absolute

Generally, under these conventions, the freedoms of speech and press are seen as forms of negative liberty and positive liberty. The former refers to the concept that a person should be left to do what he or she wants (e.g., to publish news stories without government interference), while the latter refers to the concept that the state must

act affirmatively to secure a person's rights and to enable their practical exercise (e.g., to protect a journalist from violence as she gathers news). For either conception, these commitments apply, with few exceptions, to state action rather than private action—cases in which government power is causing rights-violations or needed to prevent against such violations. However, the freedoms of speech and press are not absolute. They can be restricted in service of personal interests like reputation or public interests like national security and public safety or order. The ICCPR, for example, states that expressive freedom “carries with it special duties and responsibilities” and “may . . . be subject to” restrictions necessary “[f]or respect of the rights or reputations of others” and “[f]or the protection of national security or of public order . . . , or of public health or morals.”

National Instruments

The degree of speech and press freedom at the national level varies greatly from one state to another, in the law and in practice. That said, many states do recognize such freedoms expressly in founding documents, bills of rights, statutes, common law, or other instruments. In the Czech Republic, for example, the Charter of Fundamental Rights and Basic Freedoms states that “[c]ensorship is not permitted” and guarantees the “freedom of expression and the right to information.” It also sets forth that “[e]veryone has the right to express her opinion in speech, in writing, in the press, in pictures, or in any other form, as well as freely to seek, receive, and disseminate ideas and information.” However, these rights, like those under the international and regional conventions, are subject to similar restrictions. In France, the Declaration of the Rights of the Man and of the Citizen, which is substantially enforceable under the Constitution of the Fifth Republic, states that “[t]he free communication of ideas and opinions is one of the most precious of the rights of man” and that “[e]very citizen may . . . speak, write, and print with freedom, but shall be responsible for such abuses of this freedom as shall be defined by law.” Moreover, the Press Law of 1881 defines the rights and responsibilities of the French media. And in the United Kingdom, the common law recognizes freedom of expression,

and the Human Rights Act of 1998 incorporated into UK law the rights contained in the ECHR, including those of Article 10. Still, UK speech and press rights are subject to many restrictions, and UK defamation law is among the strictest in the Western world.

In Theory: The Freedoms of Speech and Press

The freedoms of speech and press have deep philosophical roots that purport to explain why expression should be free, and European legal instruments largely converge around three reasons: the importance of such freedoms to self-governance, to the search for truth, and to individual fulfillment. These theoretical bases attempt to breathe life into, and give meaning to, the exercise and interpretation of speech and press rights. They are reflected at all levels in conventions, constitutions, statutes, regulations, and judicial opinions.

Self-Governance

First, the freedoms of speech and press are seen as important to self-governance. This captures the idea that for the people to vote intelligently and to hold public officials to account, the people need access to information, facts, and opinions, and they need the ability to speak freely about matters of political concern. As the ECtHR put it in the 1992 case *Castells v. Spain*: “The actions or omissions of the Government must be subject to the close scrutiny not only of the legislative and judicial authorities but also of the press and public opinion.” Notably, the ECtHR has extended this principle to expression about matters of public concern more broadly. The premise is that such expression (relating to public issues in art, science, education, philosophy, literature, and beyond) might help a voter derive the knowledge and sensitivity to human values that is essential to informed judgment in the voting booth.

Search for Truth

Second, the freedoms of speech and press are seen as important to the search for truth. English poet John Milton argued in 1644 that people

would make better citizens if they were knowledgeable and exposed to diverse viewpoints, and he believed that ideas should compete for acceptance. Enlightenment thinker John Locke wrote in 1689 that the truth would prevail in any collision with falsehood and that the government could not be trusted as a source of truth. Similarly, English philosopher John Stuart Mill wrote in 1859 that restricting expression robbed people of the opportunity to make up their own minds about the truth asserted in competing opinions. And eventually these notions, all of which imagine a marketplace of ideas, came to factor prominently in the law of democracies all around the world, Europe included. For example, in the 2008 case *Vereinigung Bildender Künstler v. Austria*, the ECtHR observed that “the exchange of ideas and opinions . . . is essential for a democratic society.”

Individual Fulfillment

Third, the freedoms of speech and press are seen as important to individual fulfillment. They allow people to exercise their autonomy and to enrich their lives and realize their character by engaging with issues meaningful to them. This means that expression can be an end in itself and valuable because of its benefit to a single speaker, regardless of its wider benefit to society. British historian Timothy Garton Ash wrote in 2016 that speech is what separates humans from animals and computers, and he went on to reason that if speech is not free, then a person cannot fully be herself.

Complementary

Importantly, these three theories—focusing on self-governance, the search for truth, and individual fulfillment—are not mutually exclusive. They are complementary and in some cases entwined. In the landmark 1976 case *Handyside v. United Kingdom*, the ECtHR characterized the freedoms of speech and press as “one of the basic conditions for the progress of democratic societies and for the development of each individual.”

Regional Efforts to Harmonize Media Law

The European speech and press landscape is increasingly transnational and networked. States in

the region have arrived—through mutual arrangements in trade, travel, and security—at a point of some interdependency and even collectivism. And the news, with few exceptions, like programs on local radio stations, regularly crosses national borders to reach foreign audiences. This is true of print newspapers and magazines and some broadcasting, and of course it is true of online news.

The rich interconnectedness is accelerating the merger of international and national media law principles. For example, a state law governing defamation may be controlling in a particular case, but its application must comply with international and regional standards like those articulated in the ECHR. The challenge, then, is realizing a legal order for this kind of landscape. A full examination of it is beyond the scope of this entry, but it is instructive to consider the regional efforts to harmonize media law through the Council of Europe and the EU.

Council of Europe

First, the Council of Europe is dedicated to protecting democracy and human rights and to promoting regional unity by facilitating cooperation on legal, cultural, and social issues. Its member states are home to roughly 820 million people, and in total it has devised over 200 agreements, treaties, and conventions, including the ECHR, ultimately replacing tens of thousands of bilateral treaties between European states. Article 10 and the relevant ECtHR case law have contributed significantly to a harmonization of media law principles. The Council of Europe also issues publications and organizes events that address matters of speech and press freedom, and it provides expertise and assistance on its standards to the media. The Council issues guidance to states, too, to clarify their obligations or to recommend the development of new national regulatory frameworks. The goal of these activities is to foster an enabling environment for the freedoms of speech and press against the background of a changing media landscape online and offline.

European Union

Second, the EU governs common regional economic, social, and security issues. Its member states

are home to more than 510 million people, and its mission is to ensure the free movement of people, goods, services, and capital within its internal market, all while serving justice and establishing policies on trade, agriculture, and development. EU media law has evolved over time, at first treating media products chiefly as commodities but eventually coming to treat them as part and parcel of the public interest. Article 11 of the CFR, in particular its provision protecting media freedom and pluralism, is a notable example and a contributor to harmonization. In addition, the EU judicial branch contains multiple courts, the highest of which is the European Court of Justice. It interprets EU law to ensure equal application across all member states, and its modern case law has put a premium on fundamental freedoms, including those of speech and press. And like the Council of Europe, the EU also issues publications and organizes events that address matters of speech and press freedom as well as media pluralism.

Other Major Players: Civil Society Groups, Intergovernmental Monitors, and Press Councils

In a healthy European democratic society, the freedoms of speech and press are not only enforceable as rights but also respected as sociocultural norms and values, influenced by international and regional bodies and nation states and by private entities and individuals. Among them are civil society groups, intergovernmental monitors, and press councils. They all play roles in advancing such rights, norms, and values—conducting research, publishing studies, documenting violations, advocating in legislative or judicial proceedings, organizing events, hearing complaints, and more. They operate within the reality that norms and values can shape the extent and application of enforceable rights. Indeed, as the American writer Anthony Lewis once observed, the law does not come to be in a vacuum. The law is impressed by society as much as society is impressed by the law.

Civil Society Groups

Civil society organizations are independent from government and often represent the public interest.

Some focus on the freedoms of speech and press, or on individual liberties more broadly. Consider a few examples. Reporters Without Borders, based in Paris, is a nonprofit organization with consultative status at the United Nations and the Council of Europe. It monitors and responds to press freedom violations in the region and beyond, and it publishes the World Press Freedom Index. ARTICLE 19, based in London, is a nonprofit organization with a European program that monitors speech and press freedom, advocates for compliance with international and regional standards, and analyzes national laws that impact the media. The Committee to Protect Journalists, based in New York, is a nonprofit organization with a European program that promotes and defends the rights of journalists to report the news safely and without fear of retribution. Other civil society groups doing similar work are PEN International and the Index on Censorship, and still others with broader portfolios in civil liberties are Freedom House, Amnesty International, and the European Center for Not-for-Profit Law. Their activities have helped to shape national laws and regulatory activities and to develop and reinforce norms and values that enable the practical exercise of expressive freedoms.

Intergovernmental Monitors

In addition to civil society groups, intergovernmental organizations, generally created by treaty to work in good faith on issues of common interest, including the UN and the Council of Europe, have appointed monitors to report on and otherwise engage with media freedom matters involving their member states. At the UN, there is a Special Rapporteur on the Promotion and Protection of the Right to Freedom of Opinion and Expression. The person holding that position is mandated to gather information about violations of expressive and media freedoms, to verify and document them, and to make related reports and recommendations. At the Council of Europe, there is a Commissioner for Human Rights that encourages respect for the freedoms of speech and press, among others, by visiting member states to assess their human rights situation, by issuing reports and recommendations to states, and by collaborating with partners from civil society and intergovernmental organizations, including the EU and

UN, to raise awareness of human rights, not least those of speech and press. Similarly, the Vienna-based Organization for Security and Cooperation in Europe, which promotes stability, peace, and democracy for the billion people living in its member states, has a Representative on Freedom of the Media. The person holding that position reports on media freedom issues, holds annual conferences to discuss them, provides expert opinions, and engages with states to ensure the safety of journalists and to advance media pluralism.

Press Councils

Journalists are supposed to act ethically and be accountable to their audiences. At times, of course, they fall short, and some European states have responded by threatening to enact media regulations—ultimately seeding the ground for the establishment of press councils as pragmatic alternatives. The councils are forums to hear complaints regarding newsgathering or news content, and they come in many shapes and sizes, although not all states have one. Some press councils regulate print publications and online outlets. Others include broadcasting, and still others extend their regulation to social media. The actual regulation is varied, too. Some councils can impose sanctions for an ethical or editorial failure. Others cannot. At some councils, the members are all working journalists, and at others the members are ordinary citizens. Some councils are mandatory, meaning that all news outlets in its territory are subject to it. Others are voluntary, meaning that individual outlets may choose to submit to its authority.

The Swedish Press Council, for example, created in 1916, is funded by the media and voluntary. Its board is made up of judges, journalists, and ordinary citizens. Anyone personally affected by an outlet's newsgathering or news content can submit a complaint to an ombudsman, who can dismiss it, resolve it, or refer it to the council, which applies a code of ethics to determine whether the complaint is upheld. If it is, then the council may issue an administrative fee to the offending outlet that is effectively a contribution to the council's budget. In comparison, the German Press Council is a voluntary body funded by the state government and by publishers and journalists. It hears complaints regarding breaches of

journalistic ethics laid out in the Press Code, a set of guidelines adopted by the Council. Its board is made up of publishers and journalists (no ordinary citizens), and anyone can submit a complaint directly to the council, whether or not personally affected. The available sanctions include a public reprimand (with a corresponding obligation for the offending outlet to print it), a nonpublic reprimand, a notice of censure, and a notice giving recommendations for prudent future action.

Privileges and Responsibilities

The freedoms of speech and press—as recognized at the international, regional, and national levels—include not only rights for the media but also privileges and special and general responsibilities. As the ECtHR put it in the case *Axel Springer AG v. Germany*, the media must not cross certain lines in performing its work, particularly to the effect of harming a person's reputation or privacy rights, but it is the media's "duty . . . to impart—in a manner consistent with its obligations and responsibilities—information and ideas on all matters of public interest." Indeed, the public has "a right to receive them," the ECtHR ruled, and "[w]ere it otherwise, the press would be unable to play its vital role of public watchdog." So it is the media's vital function in democracy—in service of government accountability and public enlightenment—that justifies partly the media's privileges and responsibilities.

Privileges

Journalists and news outlets receive special privileges for their newsgathering and publishing activities. For example, they are largely free, as the ECtHR found in *Cumpănă and Mazăre v. Romania*, to seek information as they please, using the methods and techniques they deem appropriate. The underlying reason is that newsgathering is "an essential preparatory step in journalism" and an "inherent, protected part of press freedom," as the ECtHR observed in *Társaság a Szabadságjogokért v. Hungary*. Journalists also have a privilege in some circumstances to refuse to disclose their confidential sources. It is available through such authorities as the German

criminal and civil procedure codes, the Swiss constitution, UN and Council of Europe documents, and voluminous case law. For instance, the ECtHR held in *Goodwin v. United Kingdom* that a journalist's privilege to protect his or her sources is "one of the basic conditions for press freedom" without which "sources may be deterred from assisting the press in informing the public on matters of public interest." Other privileges are basically entitlements in the form of state action to facilitate the media's work. They include access to government information and places, like press conferences and judicial proceedings, and state duties to protect journalists in the field as they gather news.

Responsibilities

Journalists and news outlets have special and general responsibilities in mainly their publishing activities. As noted earlier, the freedoms of speech and press can be restricted, typically in service of personal interests like reputation or public interests like public safety or order. In individual cases, expressive interests are invoked from one or more legal instruments and balanced against the competing interests. In practice, the protection afforded to exercises of speech and press freedom often depends on the extent to which the journalist or news outlet met its responsibilities. One is to be respectful of the rights of others, construed to mean a person's interests in honor, reputation, and privacy. Another is the judiciary's impartiality and authority, which can justify restrictions on journalistic activities in the name of protecting litigants or the administration of justice. Yet another responsibility is to take into account public safety and order by not providing a platform for incitement. And still another is to be mindful of state laws that in theory protect morals. They get significant deference from international courts. These are, of course, just a sample of the responsibilities that journalists and news outlets must discharge.

FACEBOOK

Mark Zuckerberg launched Facebook in February 2004 as a way to connect students at Harvard University. In the year that followed, the social media site expanded across various universities, followed by a high school version that launched in 2005, and finally, going fully public with a single site for anyone over the age of 13 years in the fall of 2006. On Facebook, users create a personal profile consisting of a picture and various “About” sections of information (e.g., employment, school history, places lived). Users are encouraged to share status updates, which are posts that can range from personal thoughts and news to sharing links to external articles or videos they have viewed online. A user must “friend” other users on the site, which allows them to view the status updates made by their Facebook friends on the Facebook news feed. The news feed is the main view users see when they open Facebook on their mobile app or the website. The news feed allows users to keep up with recent posts and top content generated within their social network, easily commenting, reacting (e.g., liking, loving), and sharing with multiple accounts on one screen.

While Facebook was originally imagined as a site where one could connect with friends and family, the company later created the opportunity for users to follow celebrities, organizations, and other public figures. Within the realm of journalism specifically, Facebook has become increasingly more commonplace as a location to obtain

news, with the Pew Research Center noting in 2019 that four in 10 adults in the United States get their news from Facebook. What follows is a discussion of the primary features on Facebook that can be used by journalists (pages, livestreaming, and stories), efforts by Facebook to support journalism, and challenges to consider when engaging with Facebook as a source for news.

Pages

While initially created for connections between interpersonal ties, Facebook quickly expanded into the public sphere, launching Pages in 2007 as a feature that allowed organizations and public figures the opportunity to connect with users on the site. The Page operates similarly to a profile: users select a profile picture and cover image for their organization and identify “About” information, including things like a mission statement, contact information, and a link to the organization’s external website. Just like individual Facebook users, the Pages account can make status updates, follow other Pages and people, comment on and react to posts made on Facebook, and engage in direct messaging.

What a Page offers that a regular individual Facebook profile does not have is additional insights into marketing and engagement. Organizations can track actions on the page (the number of clicks on the Page’s contact information and/or call to action button), page views, page previews (those who hovered over the account name to preview content on the page), page likes, the reach

of a post (estimated based on the number of users who saw a post at least once), story reach (estimated based on the sharing of a Page's story to an individual story stream), recommendations (did someone recommend the page as a source), post engagement (including reactions, comments, shares, and clicks), video engagement, and page followers (which also identifies if anyone unfollowed the account in the last week, month, or year). In addition to a wide range of metrics to increase engagement with one's audience, Pages allows for the option to schedule posts. Pages can use the Publishing Tools function to draft posts and schedule when they will go live on the page to optimize engagement for certain times of the day and/or week (e.g., research has shown that posting around 5:00 pm EST will increase the likelihood of viewers, as users often check the site as they leave work).

Pages are the primary way for news organizations and individual journalists to connect with their audience through Facebook, expanding the overall reach of content created through their primary form of communication with the public (e.g., print, television, radio). Pages can be particularly useful for journalists who freelance, as it can allow them to share their content through the site regardless of the publisher. As of 2018, Facebook encourages news organizations to register as a News Page (i.e., any page whose primary goal is to publish news content). Pages that are registered receive specific benefits from Facebook, including the opportunity to connect their content to "Facebook News" and increase eligibility for testing new features and products that are rolled out for news organizations specifically.

Facebook Live Video

The Facebook Live Video feature was introduced exclusively to public figures in August 2015, but it is now accessible to all users on the platform. Journalists can use this livestreaming feature to report specific news stories that they bear witness to, which provides an inherent realism for the audience. Also, the "liveness" that journalists are able to capture can emphasize a sense of authenticity. Depending on the audiovisual media that is captured, the content can improve public awareness and add to public discussions. Facebook Live

points to a critical media shift. At one point in time, broadcasting live video was a complicated, technical feat that required television cameras, camera operators, trucks, and satellites. Today, the ubiquity of communication technology and social media platforms, specifically Facebook, has made the concept of "going live" as simple as opening an app.

Facebook Live provides traction for another form of journalism: citizen reporting. Audience-led forms of journalism are not a new concept, but the pervasiveness of smartphone cameras and one-touch publishing has made citizen journalism more common. Some Facebook Livestreaming videos become viral, depending on the content that is captured. Social media platforms can bypass news organizations altogether due to the spreadability of user-created content. Ironically, if Facebook Live videos receive enough traffic, then these videos can become objects of formal news coverage and outlets (e.g., CBS, NBC, ABC).

In July 2016, Facebook Live exposed the police killing of Philando Castile, a 32-year-old African American. The cultural fallout from Castile's death marked a turning point in citizen journalism. Diamond Reynolds, Castile's girlfriend, was streaming live on Facebook when her boyfriend was pulled over by the police on the side of the road in Falcon Heights, Minnesota. Reynolds captured the harrowing scene in which her partner died next to her in real time. Reynolds was able to record the exchange and shots fired by the police officer Jeronimo Yanez, a 29-year-old Latino. The video served to bear witness and added to the public discussion of race relations and police brutality.

Stories

Facebook introduced the Stories feature in March 2017. It was viewed largely as a response to the popularity of Snapchat, a social media platform that relies on users sharing short videos and images paired with filters. By employing this feature, journalists can create more polished videos for distribution on Facebook. Once Stories are posted, they are only viewable for 24 hours. Facebook has Stories features, such as Save Photos and Videos and Stories Archive. The "Save Photos and Video" feature offers the users to save photos

and videos that have been captured by the Facebook camera. These memories can be seen once a user logs onto their Facebook account, which helps to save storage for the users' smartphone. Facebook also gives the user the option to save their stories locally on their device. The other Stories feature is "Stories Archive," which allows a user to archive their Facebook Stories to reshare or repost them on the social network and through Messenger at any time. Stories are interactive: users can react (e.g., like) or comment in response to stories, similar to a regular post. Those who create the story can also share links to allow users to click through and view more related content directly from the story. Stories are viewed as short news updates on-the-go. The stories stream is at the top of the page when a user logs into Facebook, right above the newsfeed, increasing the visibility of the feature.

In September 2019, Facebook piloted a new feature for stories called *Collaborative Stories*, which allows multiple Pages to contribute to the same story for big events. Collaborative Stories was seen first for musicians at the Tomorrowland music festival but was also used again for the 2020 Golden Globes, wherein News Pages were encouraged to contribute to the joint story about nominees and winners. This feature can be particularly useful for those who seek to gain a new audience with their story; smaller newsrooms may benefit from connecting to collaborative stories to expand their reach online.

Facebook Support for Journalism

In 2017, Facebook launched the "Facebook Journalism Project," a subset of the company dedicated to connecting with journalists to develop new products, educate on how to use social media to tell stories, and also as a way to engage in conversations about best practices in journalism. Through the platform's page dedicated to the project, journalists can read weekly reports that spotlight reporters around the country and stories they have shared recently as part of Report for America. There are also guides shared to help news organizations expand their reach through Facebook and Instagram (which is owned by Facebook). Importantly, the Facebook Journalism Project provides grants and internship opportunities to support

journalism, broadly. Initiatives that Facebook took on as a result of their partnership with journalists and news organizations include the recently launched features "TodayIn," "Instant Articles," and "Facebook News" for users of the Facebook mobile app.

TodayIn is a feature available to Facebook users through their account that allows them to see local news updates in their mobile newsfeed. Facebook indicates that 1.6 million users have opted into the new feature. In an in-depth analysis of TodayIn, researchers with the News Measures Research Project (2019) highlighted how the feature served critical information needs within news deserts (i.e., communities lacking local news reporting). Although what constitutes "local" can vary greatly, the feature has provided an outlet for smaller news organizations to help expand their reach to relevant audiences, particularly in small communities.

Instant Articles is a feature that facilitates publishers to distribute as well as view their content on the mobile Facebook app. This function prides itself on its efficiency of time for articles to be published and featured immediately in the news feed. Instant Articles are also interactive and immersive for journalists to add a little more depth to their stories. There are new creative tools that are easy to use and are transformative for the mobile storytelling experience. Some of the innovative tools featured are auto play video, the ability to "Tap" and expand live photos, "Tilt" to explore photos, and interactive maps to increase engagement with the article.

Similar to TodayIn, the Facebook News section of the mobile application for Facebook connects users with content from news organizations, but on a much broader level, including publishers such as *The Wall Street Journal* and *USA Today*. When users click on the new tab from their mobile device, they can view "Today's Stories," which highlights top news for a user based on trending topics. As a user reads more content, the app will become personalized to highlight news stories that align with the user's interests. Users also have the option to hide specific news sources, articles, and/or subjects. If users have an external subscription (e.g., *The New York Times*, *The Atlantic*), they can also link to it through the Facebook News app.

Challenges

Facebook is not a news organization, but a business. Zuckerberg has stated on more than one occasion that he seeks for the site to be a neutral platform, and as such, is not responsible for the content that is shared. As a result, fake news (and accounts) have proliferated on the site. In particular, Facebook faced heavy criticism following the 2016 U.S. presidential election, when it was revealed that a significant number of the most popular articles shared on the site in the lead up to the election reported misinformation about candidates and campaign issues. Around the same time, Facebook also faced backlash when it was discovered that they allowed a third-party political consulting firm, Cambridge Analytica, to harvest data from over 87 million Facebook users through an app they had created. The app was called *This Is Your Digital Life*, which subsequently scraped data not only of those who used the app, but their Facebook friends. The concern was that Facebook subsequently allowed the data gathered to provide targeted marketing of political news to users on the site. Since 2016, Facebook has attempted to take steps to curb concerns about manipulating users and misinformation on the site by being more active in the removal of fake accounts and working to fact-check disputed articles.

One of the greatest challenges for journalists and news organizations, however, is the ever-changing algorithm that dictates what users see within their news feed. While a News Page may share an article or video on their account, there is no guarantee that it will reach all of their followers. Facebook holds close to the chest the rules that govern their algorithms, constantly tweaking them to improve the viewing experience of its users. For example, Facebook declared it would favor videos that were created and shared directly through the site (i.e., native) over videos that were imported in, causing several organizations (such as BuzzFeed) to begin to create content specifically for Facebook.

It is also not unusual to see videos that gain popularity on Facebook created and shared by everyday citizens becoming the object of news, which in and of itself is a challenge. The livestreaming feature of Facebook has, in particular, increased

the potential for users to take on the role of citizen journalists. While this can create the opportunity for individual users to gain an inside look at an event (e.g., the Women's March) or to serve as corroborating evidence (e.g., the shooting of Philando Castile), it has also served as a venue for users to broadcast their news agenda, like in March 2019 when a right-wing terrorist in Christchurch, New Zealand, livestreamed his attack on a mosque. From an ethical standpoint, determining when and how to engage with content created by Facebook users is a challenge for journalists today, one that can be circumvented by the general reach and spreadability of content online.

Final Thoughts

Facebook is not the first social media site but has emerged as one of the most prominent, with over 2 billion people now using the site each month. There are benefits and drawbacks for journalists to engage with one's audience through social media, but in today's media landscape, not engaging is rarely an option, particularly as traditional print sources struggle to maintain readership. All journalists can do is remain up to date on available features to ensure they are capitalizing on the opportunity to share the news.

FACT-CHECKING MOVEMENT

The fact-checking movement refers to organized efforts to promote, support, and institutionalize the practice of external fact-checking by journalists and other civil-society actors. External fact-checking consists of publishing an evidence-based assessment of the truthfulness or accuracy of a political claim, a news report, an online rumor, or any other public text. (In contrast, conventional, internal fact-checking by journalists or others aims to correct errors prior to making a text public.) This activity goes by different names depending on the focus; for instance, among practitioners, “debunking” most often means exposing online misinformation such as false news stories or doctored photos, while verifying claims by politicians and other public figures is sometimes called *political fact-checking*.

Fact-checking began to take shape as an occupational movement in the United States in the mid- to late-2000s. As detailed below, its roots can be traced to the rise of political blogging earlier in that decade as well as to previous experiments with external fact-checking by professional journalists. The fact-checking movement spread rapidly to other countries as both news organizations and civil-society groups followed the example of early U.S. sites such as FactCheck.org and PolitiFact.

At the end of 2019, more than 200 outlets dedicated to various forms of external fact-checking were active in nearly 70 countries, up from perhaps two dozen outlets worldwide a decade earlier. (All data on the number and variety of fact-checkers are from a count maintained by the Duke Reporters Lab at Duke University unless otherwise noted.) The growth of the movement

has been propelled by the news industry, charitable foundations, technology companies, and the public sector, as well as by fact checkers themselves, who in 2015 formed their own professional association to support fact-checking around the world. This entry discusses the origins and precursors of the fact-checking movement, its global growth and institutionalization, and emerging trends in fact-checking.

Origins and Precursors

The modern fact-checking movement emerged in the United States as a professional reaction against what critics sometimes call “he said, she said” journalism: reporting, especially about politics, that observes norms of objectivity and balance by giving equal weight to competing claims without regard to where the facts lie. Critiques of “steno-graphic” political coverage have a long history in American journalism (for instance, reporting during the Second Red Scare in the 1950s would later be condemned for giving credence to baseless, demagogic accusations). However, these arguments gained new force in the 2000s around coverage of two high-profile stories in particular: climate change, where crudely balanced reporting amplified the views of a tiny minority of skeptics challenging the scientific consensus, and the 2003 invasion of Iraq, which saw many leading news organizations uncritically transmit questionable White House claims used to justify the march to war (for instance, about supposed ties between Iraqi officials and al Qaeda).

The challenge to conventional journalistic practices was sharpened by the emergence of political blogging as a distinct genre in the same period. Taking advantage of the affordances of the web for annotation and analysis, and often identifying with the open, collaborative ethos of hacker culture, prominent bloggers presented themselves as an alternative or corrective to traditional media gatekeepers, whose reports they dissected ruthlessly. (A well-known slogan among political bloggers was “We can fact-check your ass,” referring to their line-by-line critiques of the mainstream media, or “MSM.”)

The site most widely credited with launching the modern fact-checking movement is FactCheck

.org, which went live at the end of 2003 to cover the impending presidential contest. (The popular rumor-debunking site Snopes.com appeared earlier, in 1995.) A nonprofit based at the University of Pennsylvania, FactCheck.org was cofounded by political reporter Brooks Jackson and communications scholar Kathleen Hall Jamieson. It was followed in 2007 by PolitiFact, originally run by the Tampa Bay Times but now attached to the Poynter Institute and the Washington Post's Fact Checker column; both of the new ventures adopted playful "truth meters" to rate the accuracy of political claims. Staffed by paid journalists, these three outlets routinized and professionalized the online fact-checking practiced by bloggers, for instance by systematically checking claims from across the political spectrum. They also recognized one another as peers leading a wider turn toward external fact-checking among American journalists that began in 2004.

Perhaps the first explicit reference to a fact-checking "movement" came at a 2007 conference, hosted by FactCheck.org, that brought together journalists who embraced the new genre. In 2010, PolitiFact began partnering with news organizations around the country to launch state-level affiliates, contributing to rapid growth in the number of U.S. fact-checking outlets. (Among nearly 50 active U.S. fact-checkers tracked by the Duke Reporters Lab as of late 2019, about 80% were founded in 2010 or later.) The movement gained new visibility in the 2012 and 2016 U.S. presidential contests, drawing increased attention from politicians and rising interest from the academic and foundation worlds.

The contemporary fact-checking movement built upon earlier experiments by U.S. journalists with fact-checking or "truth-squadding" political rhetoric. (That term dates to the 1950s and originally referred to efforts by political campaigns to debunk the opposition, but by the 1980s journalists were applying it to their own fact-checking.) An immediate precursor was the trend toward "adwatch" reports analyzing campaign commercials, which surged in the 1990s, after public calls from leading journalists (such as *The Washington Post's* David Broder, who was often called the "dean" of the Washington press corps) for the press to hold politicians accountable for deceptive ads. More broadly, though, the fact-checking

movement can be seen as part of a well-documented, decades-long turn toward more critical, analytical, and assertive journalism in the United States, especially in the wake of the Vietnam War and Watergate.

Global Growth and Institutionalization

Fact-checking initiatives have also multiplied rapidly around the world. One of the first was Brazil's E-farsas, a Snopes-like rumor debunking site which appeared in 2002. The United Kingdom's Channel 4 News launched an experimental site modeled on FactCheck.org to cover 2005 elections (and revived it in 2010). Near the end of the decade, sites focused on checking political claims began to appear across Europe, taking different forms in different countries; in France, for instance, major newspapers led the way, while the Balkans saw a wave of nongovernmental organization-affiliated fact-checkers backed by the National Endowment for Democracy, led by Serbia's Istinomir (or "truth meter") in 2009. The spread of fact-checking accelerated dramatically in the following decade. Of the 210 sites active at the end of 2019, just over half were less than 5 years old, and nearly 90% were less than 10 years old.

The global fact-checking movement encompasses outlets with diverse organizational structures and missions. News organizations offer a natural home for external fact-checking, and many of the most prominent initiatives, with the greatest reach, are housed in the newsrooms of national news operations such as *The Washington Post*, the BBC, *Le Monde*, *Die Zeit*, *O Globo*, and so on. The wire service Agence France-Presse operates dedicated fact-checkers in 13 countries on four continents. However, while more than half of fact-checkers globally were attached to media companies as of late 2019, others were independent (23%) or based in civil-society organizations (10%), universities (8%), or some kind of hybrid venture. Independent and NGO-based fact checkers often strike partnerships with media companies to increase their reach, but many do not identify as journalists, and see fact-checking as a tool to advance wider projects of media or political reform.

In 2014, fact-checkers from around the world met at a global summit, first convened by

PolitiFact founder Bill Adair, which has become an annual event. In 2015, they formed a professional association, the International Fact-Checking Network (IFCN), based at the Poynter Institute, a journalism education and training nonprofit in St. Petersburg, Florida. The IFCN promotes collaboration and exchange among fact-checkers by hosting the annual Global Fact conference, publishing a weekly newsletter, and maintaining a mailing list and discussion groups for fact-checkers. It has played a significant role in managing relationships between fact-checkers and outside stakeholders like foundations, technology companies, and the public sector. The IFCN has also sought to promote common professional standards for external fact-checking, and in 2016 unveiled a Code of Principles laying out norms of nonpartisanship and transparency. Outlets seeking to sign on to the Code must be evaluated for compliance by an independent assessor and are subject to periodic reassessment; as of mid-2020 there were 93 verified signatories representing nearly 50 countries. The IFCN's founding director Alexios Mantzarlis, formerly of Italy's *Pagella Politica*, was succeeded in 2019 by Baybars Örsek, cofounder of Turkish fact-checking site *Doğruluk Payı*; a seven-member advisory board is made up of representatives of fact-checking outlets.

Emerging Trends

Attention to the fact-checking movement among journalists, academics, policymakers, and technologists reached new heights beginning in 2016. Events like the Brexit vote in the United Kingdom and the election of Donald Trump as U.S. president helped to crystallize fears about a populist and authoritarian turn in many democracies, about eroding norms of fact-based public discourse, and about the perceived political influence of disinformation campaigns carried out on social media. These concerns have fueled burgeoning interest among foundations and academic researchers in the impact of misinformation and the methods and effects of fact-checking. (In January 2020, Harvard's Kennedy School unveiled the inaugural issue of the *Misinformation Review*, the first academic journal focused on these questions.) Meanwhile, fact-checking organizations have partnered directly with major technology companies and

participated in numerous public inquiries into misinformation by governments or international governance regimes.

Partnerships with technology companies have been particularly significant in shaping the field. In 2016, Google began to treat fact checks as a distinct class of data, giving them greater prominence and eventually previewing the verdicts of recognized fact-checking outlets directly in search results. (These capabilities are based on an open data standard developed by Google in cooperation with fact-checkers, called *ClaimReview*; other search engines also use the standard.) At the end of 2016, after coming under increasing press and regulatory scrutiny for its role in spreading online disinformation, Facebook unveiled a partnership program under which approved outlets (only signatories of the IFCN's Code of Principles are eligible) can earn substantial revenue from the social network for debunking false or misleading posts. The third-part fact-checking program (or "3PFC") has grown rapidly, and in early 2020 Facebook had more than 100 fact-checking partners working in 63 countries. Many of these outlets launched since the program was announced; its appeal may have contributed the surge in fact-checking after 2016 and has anchored a growing emphasis in the movement on fighting viral misinformation as opposed to checking political claims.

These platform partnerships are one example of a rising focus among fact-checkers on using technology to amplify the reach and impact of their efforts. Significant advances have been made in automating some stages of the fact-checking process, and since 2018 a number of outlets are using automated tools to support the work of their staff. One hub for these efforts is the Duke Reporters Lab, which has worked with computer scientists to develop practical tools for identifying interesting claims to check (for instance, in the transcript of a speech or debate) and for matching a statement to previously checked claims in the database. Parallel work has been carried out by the UK-based Full Fact and by the Argentinian site Chequeado. A platform developed by Full Fact can extract certain claims from live speech (for instance, during parliamentary debate) and instantaneously pull up relevant fact checks or official statistics.

Finally, some fact-checking organizations have begun to self-identify as "second-generation" fact

checkers concerned not only with making accurate information available to the public but also with actively seeking political accountability and systemic change. An open letter published in 2019 by Full Fact, Chequeado, and South Africa-based Africa Check explains, “Second generation fact checkers . . . do more than publishing fact checks. Our focus is on what we change not just who we reach. Our work is about power and accountability” (Full Fact, 2019). This explicit call to focus the movement on more active interventions in public discourse makes visible long-standing differences in the kinds of practices considered legitimate by fact-checkers with different occupational cultures—in particular, between professional journalists and more reform-minded fact checkers from civil-society organizations.

FAIRNESS DOCTRINE

The fairness doctrine was first implemented by the Federal Communications Commission (FCC) in 1949 in a proceeding titled: *In the Matter of Editorializing by Broadcast Licensees* and would be commodified into the Communications Act in 1959. The fairness doctrine itself was a direct response to the broadcaster concerns over the editorial ban implemented in 1941 as part of the Mayflower decision and the FCC's Blue Book.

Functionally, the fairness doctrine required that broadcast licensees carry information about issues of public concern and balance the presentation of those issues. While often confused with the equal time requirements for political advertising in Section 315 of the Communications Act, the fairness doctrine was a separate provision and did not grant equal time to parties.

The fairness doctrine was expanded in 1967 to include two additional provisions, the political editorial and personal attack rules. In 1969, the Supreme Court unanimously upheld the fairness doctrine as constitutional in the *Red Lion v. Federal Communications Commission* decision. The FCC's commitment to enforcing the provision began to wane in the early 1980s, however. With the appointment of deregulatory proponent Mark Fowler to chairman of the FCC, the agency began a process to repeal the fairness doctrine, basically abandoning the regulation by 1987 after the decision in *Syracuse Peace Council v. Federal Communications Commission*, but the political editorial rule was involved in a legal case during the 2000 presidential election, and a final repeal was pushed through by members of Congress in 2011. This entry first discusses the development and

expansion of the fairness doctrine, court challenges to the doctrine, and its repeal. It then looks at two provisions often discussed alongside the fairness doctrine: the equal time rule and the Zapple doctrine.

Mayflower, the Blue Book, and the Birth of the Fairness Doctrine

In March of 1939, a startup broadcast company, the Mayflower Broadcasting Corporation, filed a request for a radio license in the city of Boston, Massachusetts. At the time, both the radio station, WAAB, and the frequency were already under operation by the Yankee Network. The FCC, as was its practice at the time to deal with competing applications, scheduled a hearing to determine which organization would have rights to the license after renewal.

During a 15-day hearing in November 1939, the Mayflower Corporation tried to press its case for the station license by claiming that the Yankee Network had used the station to editorialize and attack several candidates for public office on the air during 1937 and 1938.

Although the FCC did not award the license to Mayflower, it stated in the decision that, “. . . the broadcaster cannot be an advocate.” The editorials resulted in the FCC declaring that Yankee had committed, “. . . a serious misconception of its duties and functions under the law.” The Commission also stated that a, “. . . licensee has assumed the obligation of presenting all sides of important public questions, fairly, objectively, and without bias. The public interest—not the private—is paramount.” The decision in the Mayflower case was interpreted by other radio stations as functionally implementing a ban of on-air editorializing.

Broadcasters sought guidance from the FCC on the editorial band and the requirements for public service conditioned in their licenses to operate. On March 7, 1946, the FCC released a report titled, “Public Service Responsibility for Broadcast Licensees,” commonly known as the *Blue Book*, due to its blue cover. The Blue Book was the Commission’s attempt to offer a complete and coherent programming policy for broadcasters. It provided a set of guidelines requiring stations to provide balanced programming. The Blue Book also argued for the broadcast of programming free of

sponsorships or “sustaining” programs by licensees. Broadcasters were instantly furious with the Blue Book, seeing it as an expansion of government control extending beyond the editorial ban implemented in the Mayflower decision, and members of the National Association of Broadcasters began to advocate for new rules. The FCC then responded with the fairness doctrine in 1949. The provision was then approved by Congress in 1959 as part of an addendum to the Communications Act.

Expanding the Doctrine: Personal Attack and Political Editorial Rules

In 1967, the FCC added two corollary rules to the fairness doctrine. Both were designed to provide some guidance to when content created a specific right of reply. The personal attack rule specified that in case of an “attack” on the “honesty, character, integrity, or like personal qualities of a person or group” during the discussion of an issue of public importance the broadcaster is required to give notice not later than 1 week after the attack, to provide a tape or transcript, or some other summary of the attack, and then offer to provide time for a response.

Likewise, the political editorial rule specified that if a broadcaster editorializes against or otherwise makes an attack against a candidate for office, a tape or transcript had to be made available within 24 hours. If the editorial was to be aired within 72 hours of an election, a transcript was to be delivered before the broadcast.

Red Lion v. FCC: The Fairness Doctrine Goes to Court

In 1969, the fairness doctrine was tested by the U.S. Supreme Court in *Red Lion Broadcasting Co. v. FCC*. The case arose over a response to a personal attack aired on Pennsylvania radio station WGCB. Author Fred Cook was attacked on-air by Reverend Billy James Hargis during the “Christian Crusade” program. Hargis was discussing a book authored by Cook. During the segment, Hargis claimed that Cook had been fired from a newspaper for making false charges against city officials, that Cook worked for a Communist publication, and that Cook had defended Alger Hiss. Cook,

upon hearing the segment, demanded time for a response, which he refused to pay for.

The FCC declared that Cook's complaint was valid and that Red Lion, by failing to grant a response, had failed to meet its obligations under the fairness doctrine. Red Lion argued the fairness doctrine and the right of reply guaranteed by the personal attack rule was a violation of its First Amendment rights, pointing out that the FCC had granted the broadcaster the authority to determine what programming, and by extension, what persons would have access to the airwaves. The Supreme Court disagreed with Red Lion, declaring that the free speech rights of broadcasters were secondary to the rights of listeners to hear diverse and antagonistic viewpoints. Writing for the Court, Justice Byron R. White said:

It is the right of the viewers and listeners, not the right of the broadcasters which is paramount. It is the purpose of the First Amendment to preserve an uninhibited marketplace of ideas in which truth will ultimately prevail, rather than to countenance monopolization of that market, whether it be by the Government itself or a private licensee.

Repealing the Fairness Doctrine

In the mid-1980s under Fowler, the Commission argued for repeal of many FCC regulations, including the fairness doctrine. During his tenure as FCC chair, the agency released the *1985 Fairness Report* in which the Commission argued the fairness doctrine was actually counterproductive because it was tantamount to government interference of broadcast content. The *Fairness Report* suggested that the requirement for access was restricting journalists in radio and television newsrooms by impeding discussions of important public issues. Despite the conclusion that the fairness doctrine was counterproductive, the Commission deferred action until Congress could act. As a result, the FCC continued to enforce the doctrine for two more years, during which time three cases involving fairness doctrine complaints led the agency to abandon the active enforcement of the rule.

After a fairness complaint was filed against WTVH, the Meredith Corporation's

station in Syracuse, New York, over advertisements promoting an investment in a nuclear power plant, the FCC ruled that the Meredith Corporation had violated the fairness doctrine by not allowing time for a response. In court, Meredith challenged the Commission ruling that the company had violated the fairness doctrine. While the Court agreed with the Commission's ruling on the interpretation of the doctrine, the decision in the case remanded the constitutional issue back to the Commission for further consideration.

Before the Commission could consider the remand in the Meredith decision, the FCC refused to extend fairness doctrine obligations for teletext service. The Commission struggled with the level of constitutional scrutiny to apply in the regulation of teletext. Although teletext was transmitted as part of a broadcast signal, the service itself was composed of "text" rather than the audiovisual material traditionally associated with radio and television. According to the Commission, placing teletext under the guidelines of the fairness doctrine would violate the First Amendment.

The Media Access Project and the Telecommunications Research and Action Center (TRAC) brought suit to force reconsideration by the Commission, arguing that teletext was meant for the general public and fell under the definition of broadcasting in the Communications Act. In *Telecommunications Research & Action Center v. Federal Communications Commission*, the U.S. Court of Appeals for the DC Circuit agreed in a 1984 ruling, holding that the teletext transmission was indeed a "broadcast."

Following the TRAC decision, the events of the earlier Meredith case returned to the Commission for reconsideration. Based on the findings of the 1985 *Fairness Report* and the TRAC decision, the FCC overturned the earlier ruling that Meredith was in violation of the fairness doctrine.

When the FCC was then challenged over the change in opinion in *Syracuse Peace Council v. FCC*, the Commission's determination that the fairness doctrine was no longer serving the public interest became a central point of the case. The DC Circuit Court of Appeals held in 1989 that the FCC alone retained the authority and expertise to find the fairness doctrine, as a policy, counterproductive to the public interest, and then allowed the

agency to “decide” to stop enforcement of the doctrine.

The agency stopped formal enforcement of the fairness doctrine in 1987. In 1999, the D.C. Circuit Court of Appeals ordered the FCC to defend the political editorial and personal attack rules or explain why the rules were no longer enforced. During the presidential election campaign in 2000, the FCC failed to comply with the court’s request, and the two corollary rules were suspended. Although the fairness doctrine remained on the books until 2011, Congress forced the FCC to formally repeal it, following a talk-radio campaign that suggested the agency led by appointees of President Barack Obama would bring the fairness doctrine back.

Fairness Doctrine and Equal Time

The fairness doctrine is often incorrectly associated with a similar, but entirely separate provision commonly called *equal time*. Stations, as licensees, were in charge of choosing who, how, and how long to respond in fairness situations. Equal time is the common name given to the provision Section 315 of the 1934 Communications Act, which governs “appearances” by legally qualified candidates for elected office. Equal time provisions once covered all candidate appearances, but in contemporary times functionally only apply as an access and balancing mechanism for political advertising by a candidate for office. Legally qualified candidates for federal offices are automatically granted access for paid advertising, while candidates for state or local offices may obtain “equal” access when a broadcast station or cable outlet sells advertising to other candidates in that election race.

Zapple Doctrine

One legacy provision of the fairness doctrine, an associated concept called *the Zapple doctrine*, was brought before the FCC in 2014. The Zapple doctrine applied fairness provisions beyond the coverage of candidates found in Section 315 to appearances by official supporters of a candidate. In a complaint brought by the Media Action Center during the Wisconsin governor’s recall election, the organization had requested access for

supporters of Democratic candidate Tom Barrett to match the supporters of GOP Governor Scott Walker on a series of conservative talk radio stations in Milwaukee and Madison, all of which were actively supporting Walker. The FCC rejected the complaint stating that it had no remaining enforcement authority for the Zapple or fairness doctrines.

FAKE NEWS

Fake news is typically defined as a deceptive publication presented as if the factual assertions being made are true. According to this definition, *fake news* means a story or other item created and published with the intent to deceive. Along this same line, fake news includes the republication of deceptive publications, as when a person or group shares an item, or links to a fake news story via social media, without realizing that the publication is false, or without being concerned about its truth or falsity.

In a second definition of the term, *fake news* is used as a pejorative label to ridicule media organizations and journalists who are reporting truthful information. The term *fake news* is used in this fashion to make public accusations or accusatory remarks about journalists and media organizations that either state or imply that they are deliberately spreading false reports. Mischaracterizing journalists as *fake news*, when they are investigating or reporting the truth, can have a negative impact on the democratic functioning of the free press and can lead to other social harms, including violence against journalists.

The very broadest definition of fake news is any story that is not literally true, but most analysts see this is an overly broad definition. So while parody and satire involving news events are not strictly statements of the truth, under the definition of fake news as that with an intent to deceive, parody and satire are not fake news. Determining what is, and what is not fake news, is not easy and, according to research, requires monitoring the news on a regular basis and assessing sources with a level of competency known as *news literacy*. According to research scholars, people or audiences are more often fooled by fake news because of inattention or laziness, rather than reasoning based on preexisting beliefs and political positions.

This entry first discusses the various forms of fake news, their relationship to what some scholars refer to as the post-truth era, and the role of social media users in spreading fake news. It then looks at the effects of fake news on audiences, the rise in efforts to help individuals determine whether news is credible, the deceptive use of

video editing to produce fake news, deceptive advertising and other forms of deceptive publication, and the use of accusations of fake news to attack journalists and undermine press freedom. Finally, the entry discusses the use of fake news during the 2016 U.S. presidential election and the increasing treatment of the term *fake news* as a jokey catchphrase only lightly attached to its more serious meaning.

The Post-Truth Era

When used to refer to the deliberate publication of falsehoods, fake news can take many forms, including textual, visual, and multimedia. Deceptive publications are distributed in all types of media from print and broadcast, to digital or online media, including social media. The falsehoods can be located in stories, photos, videos, graphics, or audio recordings. Sometimes a story, or other item, falls within the definition of *fake news* not because it is entirely false, but because it combines truth and falsehood together in an intentionally deceptive manner. Thus the first definition of fake news refers to publications containing information that, either in whole or in part, is not true, but appears to be or purports to be, the truth or a truthful account.

Taken very broadly, this definition of fake news also encompasses intentional falsehoods that are distributed by websites, bots, and algorithms, in the process of promoting the spread of fake news across digital media, especially when those digital tools are being used for purposes of deception. For a publication to be considered *fake news*, it must be false or otherwise inaccurate, in whole or part, when compared to verifiable facts. Often the deception is located in the content of the story, but it can also be located in a misleading headline or in an altered photo, video, or audio.

In the late 2000s and 2010s, fake news became part of a larger social issue concerning belief in the truth and the loss of objectivity, with some commentators saying that public discourse had moved into a post-truth era. Other scholarly terms sometimes used for this type of social phenomenon include “society of the spectacle,” advanced by Guy Debord, *simulacra* advanced by French theorist Jean Baudrillard, and *pseudo-events*, advanced by U.S. historian Daniel Boorstin. Another term or

phrase being used is *alternative facts*. The expression “alternative facts” was used by Kellyanne Conway, a counselor to U.S. President Donald J. Trump, during a conference with *Meet the Press* in January 2017 to characterize misstatements by the White House regarding the number of people in attendance at Trump’s inauguration.

The era of post-truth, fake news, and alternative facts had a strong impact on journalism and public discourse in the late 2010s. The terms *fake news* and *post-truth* were selected as the “word of the year” by multiple organizations, including *fake news* as word of the year by the American Dialect Society in 2017 and *post-truth* as the word of the year by the Oxford English Dictionary in 2016.

Mistakes of Fact and Social Sharing

Mistakes of fact—such as those that are the result of careless news reporting—are typically seen as not falling within the meaning of fake news because they are not intentionally false. An innocent mistake by a news organization, for example, an error originating with a reporter having no intent to deceive, could result in the publication of a false statement that is later corrected by the organization. These types of factual mistakes are protected by law in the United States under the First Amendment.

The jurisprudential theory is that some mistakes must be protected to allow for free speech. The protection of innocent and even careless mistakes of fact from lawsuits over defamation, for example, prevents a chilling effect on press freedom. Several U.S. Supreme Court opinions present the position that, in order for journalists and others to publish freely, their publications sometimes will—and indeed, inevitably will—include mistakes of fact; however, these mistakes must be excused to avoid excessive fear of subsequent punishments for publications.

In contrast, fake news stories shared on social media, even when the person sharing does not realize the story is false, are still considered fake news because of the original deception by the creator or first publisher of the item. Sometimes, after a fake news item is created and published, it is later reposted or shared, or liked, or linked or otherwise distributed by others on social media

platforms, such as Facebook and Twitter. The people who are sharing, liking, and linking to the fake news may not know or care that what they are sharing is deceptively false. These types of distributions are studied by media scholars under the terminology fake news related to the sharing economy or the like economy.

These stories and videos circulated on social media via links and likes are still fake news, because they were originally created and published by persons or groups who were being intentionally deceptive. In fact, in many instances, the deceptive purpose is achieved through the use of bots and other devices intended to promote the spread of false information via social media platforms.

Public Perception and the Impact of Fake News on Audiences

In part because of fake news allegations and a loss of trust in journalism, improved fact checking was pursued by media organizations and by nongovernmental organizations. According to the Reuters Institute, fact-checking organizations emerged in over 50 countries in the 2000s and 2010s. Because of the widespread publications of fake news, or at least the perception that fake news is increasing in volume and impact, there has been corresponding growth in the number of fact-checking websites and also in educational efforts and related publications about when and how to detect fake news with the tools of news literacy. The pioneering fact-checking website Snopes.com was launched in 1994. Now there are numerous fact-checking organizations.

Fact checking is a growing, global phenomenon with an annual summit, Global Fact, organized by Poynter’s International Fact Checking Network. Participants in Global Fact include ABC Fact Check (a collaboration of Australian Broadcasting Company and RMIT University); Africa Check (Johannesburg, South Africa); Chequeado (Argentina); FactCheck.org (Annenberg Public Policy Center, Philadelphia, PA); Full Fact (United Kingdom), *Le Monde* (France); PolitiFact (Poynter Institute, St. Petersburg, FL); and *The Washington Post*’s Fact Checker.

According to research funded by New America Foundation, a nonpartisan organization, politicians

who believe they are going to be fact checked in a public way are more likely to be truthful in claims made. Readers are interested in accurate news and fact checking. For example, the number of visitors to *The Washington Post's* fact checking page doubled in the few months after Trump was elected. Further, according to a June 2019 report by Pew Research Center, many Americans were saying that made-up news is a problem that needs to be addressed.

Even so, studies have shown that when readers are faced with empirical facts contradicting strongly held beliefs, such as political beliefs, they may reject fact checking in favor of the information that confirms their biases. The exposure to conflicting information combined with confirmation bias can lead to the entrenchment of existing ideas and polarization around existing beliefs. A key mechanism that results in polarization, according to research scholarship, is when people treat evidence generated by others as more unlikely or uncertain because the evidence is coming from those with different beliefs.

False and deceptive publications are not new to the 21st century, but instead date back at least as early as the first mass publications after the invention of the printing press in the 15th century. That being said, there is a widespread belief that the publication of fake news increased dramatically in volume and impact in the late 2010s. Research is ongoing regarding the extent of the increase in fake news stories, as well as regarding patterns of distribution, and the impacts of fake news stories.

Fake news, sent via social media and other digital media publications, travels instantaneously and can become viral, meaning that it can be both quickly and widely shared on a worldwide basis. It circulates both quickly and widely because of social media postings that are shared or redistributed in ways that are not subject to verification and fact checking. Research has not shown conclusively the answers to a series of questions, including whether fake news is increasing in terms of the volume of stories distributed or the number of people being deceived. Research is also continuing about the risks or stakes involved, including increasing concern over deception, polarization, and various social harms attributed to fake news and related deceptions.

While absolute measurements of the speed and distance of fake news circulation on social media are not contested, scholars continue to measure speeds and distances for various types of fake news distributions. Researchers are measuring the overall levels of distribution (such as the total number of shares) and have outlined the structures or networked patterns of sharing across identified geographies. Researchers are also investigating when and how fake news publishers target certain audiences, such as undecided voters.

Investigative journalists have uncovered serious issues with targeting voters with fake news in ways that tend to interfere with democratic processes. For instance, Carole Cadwalladr, a writer for the British newspapers *The Observer* and *The Guardian*, reports on the fake news ecosystem. Cadwalladr gave an influential TED talk on April 17, 2019 about the role of fake news, in the form of misleading Facebook ads targeting undecided voters. These voters were targeted for fake news dissemination during the extended debate leading up to the June 2016 referendum on whether the United Kingdom should leave the European Union (“Brexit”).

Another area of ongoing research relates to how much fake news has increased, or has not increased over time, both in reality and in public perception. Other research areas include examining which factors are influencing the dissemination of fake news. There are a variety of political, economic, and cultural factors at play, and scholars are debating which factors have a larger role in the process. Many point to political motivations as a central force, while other observers focus on technological causes, such as social media as a driver of fake news distributions in ways not previously experienced during the era of the gatekeeper media.

Deceptive Video as Fake News

With the video production of fake news, there are multiple methods of deception possible in the production process, from filming to editing, to digital alterations. For instance, a video can be deceptively shot with certain camera angles, or it can be deceptively produced with actors or imposters who are interacting deceptively with unsuspecting persons, such as fake interviews or hoax

emergencies. One example of this form of deceptive or fake interactions occurred in the “sting videos” produced about the nonprofit organization ACORN in 2009.

A video can also be deceptively edited, for instance with cuts made between shots that present an impression or overall picture to the audience that does not correspond to reality, such as cuts between a question and an answer. A video can also be slowed down to make it appear that someone was doing something he or she was not actually doing. An example of this type of deceptive editing occurred with the video of White House reporter Jim Acosta in November 2018, whose video was slowed down to make it appear as though Acosta was hitting an intern during a press conference. This altered video was later sent out via social media by the White House press secretary, Sarah Huckabee Sanders, and subsequently was shared or reposted thousands of times.

Videos also can be digitally altered with computer generated images or special effects that present false impressions. Because of new technologies, this capability is expanding. In the mid-2010s, a technology known as *generative adversarial networks* (GAN) became available that allows for realistic altering of digital video. Through the use of GAN, one person’s face, body, or likeness can be replaced with another person’s likeness in a deceptive manner, for example, in fake news publications. The GAN-altered videos are called *deep-fakes* because they overcome prior problems that existed before in using computer-generated imagery to present a human face.

Before GAN, it was difficult to make altered human eyes appear to be human eyes, rather than robotic. This problem was referred to as having an uncanny presentation, because audiences are often disturbed by the presentation of robots that look too human but not human enough. With GAN technologies, a deepfake video can make it appear as though a person is making a statement, or taking part in an event, when in reality the statements and events did not occur as depicted.

While some deepfake videos are produced for entertainment purposes, for example, having deceased actors appear in later films of a franchise, these altered videos can also be produced for deception and malicious publication. In 2019,

California and Texas both enacted laws intended to combat the distribution of deepfake videos about politicians just before an election. The alteration of photos and videos is a particularly troublesome form of fake news because of the general assumption that a photo or a video is reliable evidence that an event actually occurred.

Deceptive Advertising and Other Messages

In addition to false news publications, the concept of *fake news* can be broadly defined to include deceptive advertising, deceptive stock market postings, and other forms of deceptive publication. For instance, the Federal Trade Commission (FTC) has within its purview the regulation of false advertising and has been working to combat fake news in the form of advertisements, including native advertising, which is a form of advertising that mimics a news story or appears to be a news publication.

The FTC takes the view that advertising or promotional messages that are not clearly identifiable as advertising to consumers are deceptive. This is because the advertisements are presented as if they are news stories, which misleads readers, including citizens or consumers, into believing that the information is independently verified or is the result of impartial reporting. Even a disclaimer such as “paid advertisement” or “sponsored” does not prevent a paid-for story or other item from being prosecuted under FTC guidelines, if the item otherwise misrepresents its source or nature to the public.

Another form of fake news is a deceptive publication about a stock or financial product and service. Stock market manipulations are not a new phenomenon, but the manner in which the financial markets have become subject to fraud in the form of fake news and deceptive publications sent via social and digital media is of increasing concern to regulators.

Attacks on Journalists and Press Freedom

In recent years, *fake news* has been used in attacks on the press, especially attacks on the adversarial press when acting as a critic of political actors. The term is used as a shorthand label, for instance, saying that a journalist “is fake news.” This type

of attack on the press is not a new phenomenon, with earlier terms, such as “lying press,” being used at least as early as the 19th century. Likewise, during the 1960s, then U.S. president Richard Nixon was famous for calling the press the “enemy of the people.”

In the late 2010s, however, public accusations against the media appeared to increase. Trump, who took office in January 2017, repeatedly called journalists and news organizations “fake news” during press conferences, during conventions, and in social media. Other government actors have followed suit in using the term to attack the press. The accusation is made, even though the media actors were not engaged in deceptive publication, and even though the accusers knew, or should have known, that the media were not being intentionally deceptive. In such cases, the accusation itself is fake news.

Both meanings of fake news have been connected to the Trump presidency, including deceptive publications and accusations of fake news used to delegitimize the adversarial press. The deceptive publications tied to the Trump presidency relate to the proposition that agents of the Russian government used fake news items, specifically deceptive publications circulated via social media, to help Trump win the U.S. presidential election in November 2016.

In addition to this form of fake news, also during his presidency, Trump has inaccurately labeled news reporters as *fake news* multiple times in public settings, including during a C-SPAN recorded conference shortly before the inauguration in January 2017 as well as in videotaped White House press conferences and via Trump’s daily use of social media platform Twitter.

The use of the term *fake news*, as a pejorative label, undermines press freedom. When used to mischaracterize journalists, *fake news* is more than a misstatement. Use of the term to dismiss truthful news reporting is a direct attack on the core value of journalists because, according to the canon of ethics of the Society of Professional Journalists, the first ethical principle is to seek the truth and report it.

In a sense, *fake news* is something of an oxymoron, because *fake* means false and *news* refers to current, noteworthy information, which is by implication true. *Fake news* is the presentation of

falsehoods as if they were true. News is supposed to be true. Journalists build their reputations on gathering information and reporting the truth and function as watchdogs of the powerful in government and the private sector. This is the primary role of the free press in a democracy, as contemplated in the First Amendment to the U.S. Constitution. Attacking journalists with the label *fake news* thus has a negative impact on democratic functioning.

In addition, the use of the term *fake news* to delegitimize the free press in verbal attacks has been tied to increased physical violence against journalists. Research by the organization Reporters Without Borders reveals that the end of the 2010s was a time of increased violence against journalists in the United States and elsewhere around the world.

The use of the term *fake news* to label a story, or to disparage a media outlet, tends to delegitimize truthful stories and ethical journalists. Journalists responded to these attacks, in August 2018, with coordinated publications and editorials refuting the idea that journalism can be equated with fake news. Both print and broadcast reports were published by multiple media outlets simultaneously, in a campaign organized by the *Boston Globe* to contest the idea that the press is the enemy of the people.

Fake News, Cambridge Analytica, and Facebook

Concern over fake news circulating on Facebook did not start with Brexit and the U.S. presidential election in 2016; as early as January 2015, Facebook had added an option for its users to report that a story in their news feeds was false news. Before adding the option, the company conducted testing that revealed that users tended not to report satirical content as false because it is understood as humorous.

After the 2016 U.S. presidential election, the social networking company came under fire for failing to prevent fake news from spreading on its platform as well as for having weak privacy protections. By 2018, its privacy practices were coming under greater scrutiny as details emerged about how the now-defunct political consulting firm Cambridge Analytica was able to acquire the

personal data of millions of Facebook users through a personality quiz.

While Cambridge Analytica played a role in the online efforts of the 2016 Trump campaign, the exact nature of that role and how the company used the data it obtained from Facebook remained unclear as of mid-2020. What is not in dispute is that the company abused Facebook's policies giving researchers access to data for academic purposes and that Facebook's algorithms promoted the circulation of false stories during the run-up to the election.

Facebook founder and chief executive officer Mark Zuckerberg at first responded that it was a "crazy idea" to think that his company had played part in the outcome of the 2016 presidential election. By December 2016, however, shortly after the election but before Trump took the oath of office, Facebook was rolling out tools to combat the spread of false news. The social media giant decided on a procedure for flagging or tagging stories as disputed or fake news, which it called "Disputed Flags." Facebook's Disputed Flags were only for stories presented as news and not for personal posts. It also announced partnerships with fact-checking organizations that were to begin flagging stories as false based on multiple user reports and a process of verification. Initial partnerships were with Snopes, PolitiFact, ABC News, and FactCheck.org. Some of these relationships or partnerships did not last long.

By the end of 2017, Facebook announced that it would be replacing its "Disputed Flags" system with a "Related Articles" feature, in order to give readers more context to a story that was being reported as false. Research had revealed that placing flags on stories can lead to more entrenched beliefs in the truthfulness of the story or to beliefs that other stories that were not flagged were necessarily true. Facebook said that its research showed that placing related articles next to a disputed story can lead to fewer shares.

Zuckerberg came to Washington, DC, and testified about fake news and social media privacy issues before the U.S. Congress in April 2018 and in October 2019. As of mid-2020, Facebook was still working with FactCheck.org and PolitiFact and had also engaged the Associated Press and Reuters Fact Check to work on combating fake news.

Fake News as Meme

By the late 2000s, the phrases "fake news" or "that's fake news" had become catchphrases being used, for example, as punchlines to a joke and as a shorthand way of ridiculing what someone said, but not always with the related assertion that the other person was being untruthful. In this context, "that's fake news" is understood as a lighthearted comment, or in some instances, more seriously, as a form of social commentary, but not an assertion about deception or truth telling.

There were cartoons distributed in print and online, as well as many social media memes, or widely spread cultural expressions, including videos, slides, and photos, that were captioned with the term *fake news*. These fake news memes discussed the topic in both humorous and critical ways.

FEATURE SYNDICATES

A feature syndicate is a supplier offering an often quite considerable menu of comics, editorial cartoons, columns, and other features for newspapers across the country. Papers pay a subscription fee for what they select to use, the fee varying by the size of the market and circulation of the subscribing paper. Feature syndicates help broaden the non-news content offerings of newspapers, especially those in smaller communities, by providing national markets for print and graphic material.

Feature syndication in the American press has a long history—back to before the Revolution in one case, though really starting a century later with preprinted features distributed to rural 19th-century weekly newspapers. Modern syndicates

serving the daily press developed early in the 20th century around popular comic strips, political columnists, and other features.

Origins

The first informally syndicated feature in American journalism appears to have been “Journal of Occurrences,” a propaganda column written in Boston in 1768. It appeared weekly in three papers for just under a year, letting readers in other colonies know what was happening under British military occupation of Boston. But the column was “informally” carried by many other papers as well.

Ansel Kellogg founded a readyprint service in Chicago during the Civil War (1861–1865). It provided such features as columns, poems, sometimes-serialized fiction, and other entertainment-based material and display advertising for inside pages of newspapers, leaving the front and back page open for the local paper to fill with stories and advertisements. This process became known as *patented insides*, for the patent medicine advertising they carried. Until the 1890s, lack of effective copyright protection made metropolitan newspapers widespread users of British literary and dramatic works as filler, often published in serial form.

Development of the stereotyping process provided a technology boost to syndication. Light stereotype molds (dubbed *boiler plate*) could be readily shipped or mailed to subscribing papers. Soon the business of providing these got organized with formation of the Western Newspaper Union in Des Moines, Iowa, in 1872. Other firms developed as syndication took hold, but Western grew to dominate the field by 1917, serving some 7,000 papers (many of them weeklies serving small communities) at its peak. This approach, which ended in 1952, gave way to yet another syndication idea.

The rise and expansion of both daily and Sunday newspapers (the latter’s longer formats called for more content, and thus demand for syndicated graphic and text material increased) helped create a new form of syndication late in the 19th century. C. A. Dana’s *New York Sun* syndicated use of stories by Bret Harte and Henry James to a limited number of other papers. Using stereotype and

electrotyping technology, the American Press Association began to serve daily papers in 1882. Irving Bacheller (1859–1950), a journalist and writer who created the first newspaper feature syndicate, focused on syndicating material to daily papers beginning a year later and was within a few years serving more than 150 of them in cities across the nation. Publisher S. S. McClure joined the growing number of syndicators in 1884, often using content from his magazine *McClure's* by such authors as Jack London, Robert Lewis Stevenson, and William Dean Howells. He was soon providing up to 30,000 words a week to subscribers.

Development of electrotyping technology in the mid-1890s made wide distribution of color graphic material possible. Paced by the means to print them, demand for comic strips soon drove the syndication business.

Growing out of E. W. Scripps' syndication activity in the 1880s, and his Newspaper Enterprise Association of 1902 (which at first supplied only the Scripps-run papers), the United Feature Syndicate was founded two decades later with nearly 400 newspaper clients, and syndicated such literary names as Carl Sandburg, Ernest Hemingway, and Ring Lardner. Eleanor Roosevelt later wrote her "My Day" column for United (from 1936 until 1962), becoming the first (and only) First Lady to write a newspaper column.

After a careful analysis of potential newspaper demand, and its own initial syndication efforts, the Hearst chain began its Newspaper Feature Service in 1913, which soon expanded into the King Feature Syndicate in late 1915. King focused heavily on comic strips and illustrated features to attract readers; he placed artists on a salary and took control of characters to further its control of the content syndicated. By the mid-1930s, it was operating a number of syndication services to a huge list of client newspapers, along with pre-printed weekly (Sunday) magazine and comic publications.

Larger metropolitan dailies in cities such as New York, Chicago, and Los Angeles began to syndicate their own columns and other features. The *Chicago Tribune* began this in 1910, the *New York Tribune* in 1914, and *The New York Times* much later in 1960. So did the major news agencies such as the Associated Press and United Press.

By the mid-1920s, there were easily 100 or more feature syndicates of all kinds operating (with 2,000 different and continuing features on offer)—they formed their own trade association in 1926. The number varied during and after the Depression, but was similar by the eve of World War II. By 1960, there were nearly 200 operating syndicates large and small.

Syndicated Content

The variety of content provided by the major syndicates in the early 2000s included a wide breadth of options from which newspaper publishers could select. United Features, for example, provided some 50 daily comic strips, the work of 10 editorial cartoonists, and a whole menu of columns including advice (3), commentary (15), consumer and finance (8), entertainment (7), food (3), health (2), horoscopes (3), home and garden (4), sports (3), and others. The service also offered nearly 20 different puzzles and games. Several other syndicates offered at least as much.

Comic Strips

Comics, and especially Sunday strips printed in color, formed the core of modern syndication efforts. The "Katzenjammer Kids," which began in 1897—and was based on an earlier German comic strip—remains the oldest comic strip still in syndication. The King syndicate offered several dozen comic strips by the 1920s, and more all the time. In the bottom of the Depression in the early 1930s, some of the most popular syndicated strips brought their creators weekly salaries of more than a thousand dollars. United's comics included (by 1950) the hugely popular "Peanuts," for which the syndicate selected the name, though cartoonist Charles Schulz never liked it. With its affiliated syndicates, King Features distributed (by the early 2000s) three times as many comic features as its next-largest competitor.

Editorial Cartoons

The early 1900s marked the height of editorial cartooning syndication as few smaller papers could develop and produce their own. Syndication added greatly to the impact of individual political

cartoonists, carrying their images far beyond their “home” newspaper to a wider audience. Sometimes only occasional cartoons were carried in weekly “roundups” of the best images of that week or concerning a specific event, but some were regularly displayed in a variety of newspapers.

Political Commentary

Political column syndication began with David Lawrence (in 1916) and Mark Sullivan (3 years later) being offered to other newspapers around the country. Walter Lippmann joined the growing number of political writers in 1931 and was carried in 165 major papers a decade later—with a large salary to match his growing impact. He had become the widely respected and influential dean of the genre on his retirement in the early 1960s. Drew Pearson began his “Washington Merry Go Round” of political gossip in 1932 and it quickly became a huge and lasting success (continued by Jack Anderson well into the 1990s). Britain’s Winston Churchill survived economically on his syndicated writings in the 1930s, many carried in American papers. The new Gallup poll provided features about what people thought about major issues and trends by 1935, an early example of public opinion polling. By the late 1930s and increasingly in later years, many political columns took strong political stances to the right or left.

Gossip and Show Business

Society gossip content in a few metropolitan newspapers dated at least to the 1820s and appeared continually thereafter. National syndication was slower to develop. By 1924, Walter Winchell was reporting on Broadway for New York tabloid papers, soon joined by Hollywood columnists Louella Parsons and Hedda Hopper. All three were widely syndicated and thus held considerable power in the show-business world into the 1950s. Many others centered on stage, motion pictures, radio, and eventually television. To some extent, the latter began to siphon off some of the genre by the late 20th century—as when Broadway columnist Ed Sullivan hosted a CBS television variety program for two decades.

Modern Living and Advice

Dorothy Dix began to write a women’s column in 1896 and kept it up for four decades. Later examples were the long-lived “Ann Landers” and “Dear Abby” columns, written by two sisters, and running nearly as long as Dix’s effort. Numerous fashion and sports columns and illustrations were being syndicated by the late 19th century. Religion was an early and steady feature—in 1934, for example, King ran a 40-installment version of the Bible. Humor was always an appealing feature of syndication—Will Rogers wrote a daily column from 1922 until his death in 1935, eventually reaching 400 newspapers. Many others would follow his example.

The parlous state of many newspaper balance sheets by the early 2000s made syndication more important as the shared cost basis of the system was seen as an efficient and attractive means to display nationally known columns, features, and comics in small as well as metropolitan papers.

Feature syndicates play a newspaper role somewhat analogous to broadcast or cable networks, contributing to similar content across the country.

FEDERAL COMMUNICATIONS COMMISSION (FCC)

The Federal Communications Commission (FCC) is an independent regulatory body created by an act of the U.S. Congress on June 19, 1934. The Commission was established to regulate broadcasting and wired communication services in the United States, its possessions, and its territories. It reports directly to Congress. As of 2020, the FCC had approximately 1,450 employees and a projected annual budget of approximately \$335 million. The agency typically offsets some of its operational cost through the collection of application processing fees and auctions. The FCC is charged with regulatory oversight of the nation's broadcast, cable, satellite, and telecommunications services.

With the passage of the Communications Act of 1934, the newly formed commission became operational on July 11, 1934, and merged the regulatory responsibilities of the Federal Radio Commission, the Postmaster General, and the Interstate Commerce Commission into one agency that dealt with broadcasting and telephone services. The 1934 Act has been amended many times since its passage, with the passage of the Telecommunications Act of 1996 representing the first major overhaul of the law. Many of the alterations and additions to the law over the years were in response to technical changes in communications, including the introduction of television, satellite and microwave communications, cable television, cellular telephone, the Internet, digital broadcasting, and personal communications service.

The nature of regulatory oversight has changed over the history of the FCC as Congress redefined its intentions for the agency and the industries it oversees. For example, in 1996 Congress mandated that the FCC develop policies that would accelerate technological innovation and allow competition within various segments of the communications industry.

The Telecommunications Act is divided into various sections that enumerate the organizational structure, duties, and powers of the commission. Title I defines the administrative structure of the

agency. Title II concerns common carrier regulation while Title III spells out regulatory oversight of broadcasting. Titles IV and V outline the procedural and administrative provisions under which the commission must operate and what penalties may be imposed for infractions. Title VI outlines the regulatory powers related to cable communications and Title VII enumerates miscellaneous provisions not included in other sections of the act.

The Organization of the Commission

The Telecommunications Act describes the administration, formation, and powers of the FCC. Five regulatory commissioners are appointed by the president and confirmed by the Senate. Commissioners serve a 5-year term except for when an appointee is filling an unexpired term. While the president nominates commissioners, no more than three commissioners can be members of the same political party. The FCC chairman, who is designated by the president and usually shares the president's political party, sets the agenda for the FCC. The commissioners supervise all the FCC activities, delegating responsibilities to various bureaus and offices within the commission.

Responsibility for oversight of electronic media (radio, television, satellite, and cable services) is concentrated in the Media Bureau. The Wireless Telecommunications Bureau oversees cellular and personal communications service phones, pagers, and other nonbroadcast radio services. Unlike the Media Bureau, the Wireless Telecommunications Bureau must develop rules that serve the needs of both consumers and business users. Today, many Americans access media via their smartphones so the lines between cellphone and media player are becoming blurred.

The 1934 act was written in broad terms and provided the FCC with the ability to promulgate rules and regulations as a means of administering communication policy. These rules and regulations are sometimes developed to reflect the intentions of Congress but are also initiated to solve problems that develop as technology advances or when user conditions warrant changes to previously developed policy. The commission will usually gather information about a subject before

attempting to develop or make major changes to policy. After reviewing comments, the commission may determine that regulation is needed and will release a notice of proposed rulemaking. During this period, the FCC will gather responses and comments about the proposed rule. After comments have been solicited, the bureau in charge may recommend that a proposed rule be adopted or modified. The commissioners then vote on the proposal, typically at an open monthly meeting. A simple majority vote is needed for a proposal to pass. Rules and regulations adopted by the commission have the same force as law and are subject to judicial review. Decisions may be overturned by the courts or sent back to the commission for reevaluation.

Regulatory Issues for the Commission Related to Media

By law, the Media Bureau must concern itself with licensing, engineering, and technical considerations, and its responsibilities are spelled out in Section 303 of the Telecommunications Act. While the FCC is charged with regulation of media, Section 326 of the Telecommunications Act bars it from making content decisions about broadcast programming. Since the FCC is a creation of Congress, the legislative body can stipulate that it enforce specific policies. For example, Congress codified regulations concerning indecency and obscenity and authorized the FCC to enforce a ban against indecent and obscene programming on radio and television stations. Although records show that the commission has been concerned with this issue since its earliest days, indecency gained some prominence as programming has become more provocative and sexually overt over the years. The boundaries as to what may or may not be broadcast are variable since the courts have ruled that cable and streaming services have greater leeway for programming because they are not “licensed” broadcast services and do not use the public airwaves. This disparity between broadcast and cable programming services has caused confusion with the viewing public and difficulties for the FCC as it tries to apply enforcement standards for broadcast outlets. In recent years, the number of fines for violations levied by the FCC has decreased.

The FCC first took up the issue of children’s television in 1974, when it called upon broadcasters to discontinue practices such as allowing the hosts of programs to advertise products aimed at children. From 1980 through 1990, the FCC provided little guidance regarding children’s television as the agency moved toward marketplace regulation. However, amid growing concern regarding violent programming content, Congress mandated the FCC to develop regulations in children’s television.

The Children’s Television Act of 1990 restricted the number of minutes of advertising on children’s shows to 12 minutes per hour on weekdays and 10.5 minutes per hour on weekends. The act also required broadcasters prove that they have met the “educational and informational needs of children” age 16 or younger by airing programs specifically designed for this audience. Additional rules adopted in 1996 required commercial television stations to offer at least 3 hours of regularly scheduled educational or informational children’s programming per week. Children’s programming had to be clearly identified and stations had to notify program guides regarding the appropriate ages for the programming. First Amendment advocates expressed reservation about the implications of government mandatory children’s programming requirements while critics of television point to the fact that many stations frequently listed wholly entertainment shows as educational. By 2005, broadcast networks complained about the programming requirements as children’s program ratings declined in the face of increasing competition from full-time cable networks. In 2019, the FCC relaxed many of the reporting requirements of the 1990 act, including easing some restrictions of some core programming requirements that are counted toward meeting the weekly 3-hour obligation.

The FCC has changed regulatory policies as the entertainment business has grown from radio to include television, cable, and satellite to advanced services. Early regulatory policy tended to be prescriptive, spelling out detailed rules about station performance, record-keeping requirements, and license renewal procedures. Language in the Communications Act of 1934 required that broadcasters serve in the “public interest, convenience and necessity” without defining exactly what these

requirements would entail. The agency tried to provide guidance to broadcasters without defining specific programming requirements through the hearings process.

Among early concerns of the FCC were issues of fairness and balance in programming to local communities, overcommercialization, and abuse of network power over its affiliates. During the golden age of radio in the 1930s and 1940s, the FCC promulgated rules that spelled out the interrelations between networks and their affiliates. As television grew, the FCC developed rules to encourage the use of all channel broadcasting and stressed the importance of having broadcasters develop a local presence in the community of license. During the 1970s, the agency adopted substantial filings requirements for broadcast licenses and asked broadcasters to investigate the needs of their community of license.

The fairness of news and other broadcast content has been a concern of the FCC. Congress mandated political candidates' access to the airwaves in Sections 312 and 315 of the Communications Act of 1934 but did not specify how broadcasters should report on controversial issues. Early on, the FCC insisted that because of "scarcity," a licensee must operate in the public interest rather than promote only the licensee's point of view. Initially, the FCC frowned on stations developing editorial policy but later reversed itself in 1949 by adopting the fairness doctrine, which encouraged stations to cover issues by providing "equal time" for opposing points of view. The constitutionality of the fairness doctrine and Section 315 was upheld by the U.S. Supreme Court in *Red Lion Broadcasting v. FCC* in 1969. Broadcasters complained that the doctrine produced a "chilling effect" on speech and cited the possibility of fighting protracted legal battles in fairness doctrine challenges. In reality, though, the FCC typically determined station "fairness" based on the overall programming record of the licensee. The court reaffirmed the notion that licensees were not obligated to sell or give time to specific opposing groups to meet fairness doctrine requirements as long as the licensee met its public trustee obligations.

In the early 1980s, the FCC changed direction reflecting the changing political atmosphere and adopted a deregulatory stance, using "marketplace

competition" as an alternative model to rule-based regulation. In 1987, the FCC repealed the fairness doctrine, although the equal opportunities requirements ("equal time") rules remain in place for political candidates.

The Telecommunications Act of 1996 called for relaxation of ownership rules, particularly for broadcasting. Following its passage, the radio sector of the broadcast industry quickly consolidated into a few large group owners controlling the most powerful stations in the country. Television ownership was also relaxed, with a cap placed on the percentage of the U.S. population that could be reached by a group owner. Today large corporations tend to dominate the media scene. For example, AT&T acquired Time Warner, which included CNN, to bolster its wireless and streaming businesses. Disney owns ABC and ESPN along with its highly profitably theme parks and film studios. In addition, in 2019, it started the streaming service Disney+ to compete with Netflix.

Today, new communication services are provided via the Internet, including over-the-top applications, and streaming services such as Netflix, Hulu, YouTube, Facebook, and many others. Faced with increasing competition from these new services, consolidation of ownership among broadcast licenses and cable operators has increased. Many traditional broadcast and cable channels now offer programming apps on devices such as Amazon Fire, Apple TV, and Hulu. Some television networks even offer unique programming on their streaming services that are not available on broadcast channels. Starting in 2013, streaming services such as Netflix and Amazon began producing large budget television programs mixed with older television favorites from the United States and abroad, hoping to attract monthly subscriptions. By 2019, it was estimated that Netflix had 60 million monthly subscribers. In light of these new services, viewership of broadcast television and cable have been declining.

New Communication Paradigms and FCC Initiatives

When Congress passed the Telecommunications Act in 1996, it substantially redirected communication policy toward a converging marketplace of telecommunications services. Congress directed

the FCC through the Telecommunications Act to evaluate commission rules biannually, encouraging the FCC to eliminate unneeded regulatory policies. Since 2017, the FCC has taken steps to further loosen FCC filing requirements across the various communication fields.

With the increase in the numbers of broadcast stations and competition in the entertainment industry spawning numerous new alternatives for consumers, some experts claim that the importance of individual stations has decreased. Early commission policy had stressed the importance of “localism” as a goal for individual licensees. However, with ownership consolidation over the years many radio stations have become highly formulaic. One outcome is a growing demand for music streaming services for mobile and web-based devices such as Spotify and Apple Music.

While some television stations have become outlets for national network and syndicated programming, others have expanded local news and community content merging their broadcast, web, and mobile applications to provide 24-hour local information and weather services to their communities. Many television licenses now program two or three different channels in the local market as a way to improve efficiency and contain costs. As programming becomes more expensive and more lucrative for distributors, large group owners are using their consolidated positions to negotiate retransmission agreements, but smaller stations have found this process difficult. In December 2019, Congress passed the Television Viewer Protection Act to make the process of negotiating with multichannel video program distributors easier. In early 2020, the FCC began a rulemaking hearing to implement the new law.

Media companies, both large and small, have worked to develop strategies to compete in this new arena. Traditional broadcasting companies such as Disney and hardware companies such as Apple have entered the streaming business to compete with Netflix and Amazon. What the future of media services will look like is difficult to predict.

Among the initiatives that the FCC has identified as its major priorities is ensuring high-speed, broadband access to all regions of the United States. Today many parts of the country do not have access to those services. Since 2019, the FCC has stepped up implementation of rules for 5G

upgrades and had proposed procedures that would expand deployment of broadband to rural communities, opening additional opportunities in telehealth programs. These new rules are meant to expand access to mobile and wireless services which, in turn, should improve access to information, health, and entertainment services for rural Americans. The FCC has moved to promote broadcast Internet opportunities through the adoption of a new standard for broadcast transmission called ATSC 3.0. This technology is Internet protocol based and would allow broadcasters to provide many new services in the broadcast spectrum. The FCC started a notice of proposed rulemaking for this service in December 2020.

In 2020, the novel coronavirus pandemic demonstrated the importance of telecommunication services in times of national emergency. As stay-at-home orders took effect throughout the country, millions of people began using video conferencing services such as Zoom and FaceTime to work from home, meet socially, and continue their educational studies. Disparities between haves and have-nots have accelerated the push for rural development and other lifeline services. As of 2020, rapid changes in communications technology coupled with the uncertainties of the impact of the pandemic were placing new burdens on the FCC’s resources. According to agency records, the time necessary to complete rulemaking has increased in recent years while the number of completed proceedings decreased.

FEMINIST NEWS MEDIA

Feminists have always used available technologies to disseminate relevant news, promote feminist causes, challenge dominant conceptions of women, dramatize new visions of womanhood, and sustain a sense of feminist community. In general, feminists criticized the mainstream media for mocking, misrepresenting, or marginalizing their politics and activities or ignoring their interests altogether. Therefore, at least until the 21st century, feminists have relied on their own outlets to share news and sustain a community marked by commitment not only to feminist theories about gender oppression but also to specific political and ethical principles. Often, feminists run their newsrooms, such as they are, finance their work, and make reporting and writing decisions by those same principles. This entry examines the beginnings of feminist news media in the 19th century, its expansion in the 1970s to 1980s, and feminist journalism in a digital era. This entry begins by examining the principles underpinning feminist journalism.

Guiding Principles of Feminist Journalism

Each medium has a material and technological structure, cost of entry, and need for both elaborate infrastructure and trained staff may either constrain or promote social movements and facilitate (or discourage) certain ways of interacting. Some are good for reaching already-known sympathizers, others for unknown but potential converts. Typically, feminists have not cared much about financial profit; slick production values are of low priority, not merely to save money but also as a matter of principle and because they tend to rely heavily or even exclusively on volunteer and often untrained labor. Broadcast television requires equipment, large staffs, broadcast licenses that make a feminist television station unlikely. Yet, feminists have actively sought to produce their own newspapers, magazines, cable public service shows, documentary films, and now especially internet and social media sites that provide feminist news to a variety of feminist audiences as well as to audiences not already converted to that cause.

In 1976, *Media Report to Women* (MRTW), launched in 1972 as a monthly newsletter and now a quarterly online journal that continues to cover how print, broadcast, cable, and online media depict women, asserted three principles of feminist journalism. Donna Allen, who founded MRTW and the Women's Institute on Freedom of the Press, asserted that feminist journalism does not attack anyone or pass judgment on people's opinions, actions, or ideas; prioritizes facts over opinion; and lets people speak for themselves.

The first two principles never characterized feminist journalism, although they may have guided MRTW's news selection and presentation decisions and perhaps also served as a useful standard for examining the performance of other outlets. The third principle remains, however, with its conviction that letting people speak for themselves provides information that is more accurate, diverse, complex, honest, and reliable. What characterizes feminist journalism is a commitment to taking women seriously—their lives, their ideas, and possibilities, as well as their differences. Feminism has always been plural, so feminist news outlets offer dramatically different versions of feminism and regularly argue with one another. Allen's third principle also underscored the premise that news outlets don't cover women's activities and issues enough or fairly, in part because men were speaking for and about women. Feminist news media usually disdain professionalism as elitist and insist that, even if some men are involved in their production, women have important and leading roles in their production, especially in their editorial direction.

19th-Century Social Movement Periodicals

The earliest newspapers and magazines in which women articulated a political position emerged in the mid-19th century, when women advocated on behalf of the abolition of slavery and temperance; periodicals also addressed other issues of particular concern for women, such as health and dress reform, prostitution, liberalized divorce laws, birth control, and free education. In 1828, Frances

Wright, an abolitionist who had been active in a socialist commune, began editing the *Free Enquirer*; she advocated equal rights for women, universal suffrage, abolition, liberalizing of divorce laws, birth control, and free education. Amelia Bloomer initially proposed *The Lily* (1849–1856) because local temperance leaders limited women's participation to fund-raising and attending lectures. These editors made their missions explicit in slogans and mottoes that appeared right below their banners: *Lily* promised to work for the enfranchisement, and emancipation of women from unjust laws and “the destructive influences of Custom and Fashion.” Elizabeth Aldrich's *Genius of Liberty* (1851–1853), “Devoted to the Interests of American Women,” was among several pre-Civil War papers promoting the “enlargement of the sphere of women.” In 1852, Anna Spencer began the *Pioneer and Woman's Advocate* on behalf of “Liberty, Truth, Temperance, Quality.” Paulina Wright's *The Una* (1853–1855) addressed suffrage, marriage, coeducation, and women's work.

Many late-19th century women's suffrage journals either began with a different scope or expanded their scope to embrace multiple feminist issues. The *Revolution* (1868–1870), published and edited by Susan B. Anthony and Elizabeth Cady Stanton, took up the cause of women victimized or abused by men, including prostitutes, and demanded changes in marriage and divorce law. The slogan of *The New Northwest* (1871–1888) produced in Oregon by Abigail Duniway (with the help of three of her six children) announced that it was “A Journal for the People, Devoted to the Interests of Humanity, Independent in Politics and Religion. Alive to all live Issues. Thoroughly Radical in Opposing and Exposing the Wrongs of the Masses.” The *Farmer's Wife* (1891–1894) in Topeka, Kansas, advocated suffrage as well as Populism, prohibition, veterans' pensions, industrial protectionism, and “social purity.” Those women's rights editors constituted a heroic model for later feminists. Chrysalis (1977–1980) republished selections from Susan Anthony and Amelia Bloomer. The feminist collective publishing *New Women's Times* (1975–1984) in Rochester, New York, often invoked Anthony's name.

Broadening the Scope of Women and Women's Issues

Especially by the 1890s, when suffrage editors narrowed their focus to getting the vote, periodicals emerged for other causes, notably for African American women. In 1894, Josephine St. Pierre Ruffin, a member of the New England Woman's Press Association and a friend of major Boston suffragists, launched *Woman's Era*, the first newspaper published by and for middle-class African American women. She also founded the Woman's Era Club. Ruffin was editor and publisher, her daughter Florida was the assistant editor, and her husband George, a pro-suffrage state legislator, was also involved. Most of the pages were filled with club news and reports of the activities and plans of Black women's groups around the country. The magazine also included articles on health, exercise, etiquette, as well as gossip, fiction, and poetry. In an 1896 article complaining that no men editors had found space for speeches given at a Congress of Women, Ruffin predicted that eventually Black women would realize that only through their own papers would their hard work become made known. The paper died in 1897.

More radical papers also emerged, such as *Lucifer the Lightbearer* (1885–1906), which advocated free love and anarchy. *Far and Near* (1890–1894) represented a loose-knit coalition of working girls' clubs. Among publications with broad ambitious notions of women's political and economic freedom was *The Socialist Woman*, started in 1907 and renamed *The Coming Nation* for its last 2 years, 1913–1914. The well-known feminist novelist and progressive activist Charlotte Perkins Gilman published *The Forerunner* from 1909 to 1916. Perkins wrote the entirety of every issue of the monthly—essays, editorials, articles, especially featuring women's rights and suffrage, as well as book reviews, poems, short stories, and six serialized novels, including *Moving the Mountain*, *Herland*, and *With Her in Ourland*, Gilman's utopian feminist trilogy. At its peak, *The Forerunner* had 1300 subscribers; having refused advertising Gilman subsidized the periodical herself.

Second-Wave Feminist Periodicals

In the late 1960s, when the term *feminism* came into popular use, not merely mainstream media but also radical countercultural movements marginalized, if they did not altogether ignore, feminist issues. The 1970s, therefore, gave rise to hundreds of feminist periodicals. Some lasted only for a year or two, or even only for an issue or two, when the economic, physical, and time burden of production outweighed passion and zeal for exchanging information. The University of Southern California archive holds more than 300 U.S. lesbian and feminist periodicals that appeared in and after the early 1970s.

Women's liberation groups and media outlets of the second wave (the era of the late 1960s to 1990, with the women's suffrage movement referring to feminism's first wave) were not averse to denouncing one another. Yet larger magazines usually tried to unite disparate factions within feminism or even reach women outside the liberation movement. The U.S.-based *Ms.* magazine and UK-based *Spare Rib*, both launched in 1972 and sold on newsstands, drew both praise and criticism for trying to simultaneously please liberal feminists, radical feminists, lesbians, housewives, and women of color. Antifeminists rarely bought copies of even those magazines interested in reaching and serving a broad audience, however. And most of the second-wave feminist outlets served niche communities, by religion, political persuasion, generation (*Prime Time* reached older women), and profession. *Coyote Howls* was a sophisticated San Francisco-based newspaper for and by prostitutes. *La Wisp* discussed peace. *Union Wage* advocated labor issues.

Most second-wave feminist news outlets accepted some advertising, but limited the kind of advertising they allowed. A few declined any advertising, such as *No More Fun and Games* (1968–1973), which instead raised money with film showings and poster sales. Rather than yield to coercion from cosmetics advertisers, for some time *Ms.* refused all advertising. (*Ms.* survived, and now online, maintains a broad-based provocative blog site, *Ms. Musings*.)

Some charged men more than women; lesbian periodicals rejected information from or

subscriptions for straight people and/or men. Evolving distinctively feminist ways of working and noncompetitive structures and nonhierarchical decision-making processes was even more important, albeit difficult. In particular, second-wave feminists experimented with alternative formats and with innovative organization, often non-hierarchical collectivities. Sometimes jobs and titles were rotated; some collectives dispensed with titles and bylines. The Washington DC collective producing *off our backs*, among the best-known and certainly the longest surviving second-wave periodical in the United States, from 1970 to 2008, operated by consensus. Volunteers experimented with alternative ways of organizing their work and articulating ethical standards. Exemplifying feminist journalism's explicitness regarding activism and advocacy, and disdain for conventional journalistic principles and professionalism, *oob* announced that it intended to be just but not impartial.

In the mid-1970s, many separatist (i.e., anti-male) lesbian magazines began, with some of them criticizing the feminist press as heterosexist: lesbian volunteers for *off our backs* split to form *Furies*. *Lesbian Tide* (1971–1980) rejected information from straight people or gay men; others referred to wimmen or womyn to avoid the word “men.” Many incorporated Lavender into the name. Otherwise, their names hint at a strident spirit and political independence: *Amazon*, *Dyke*, *Lesbian Feminist*, *Sinister Wisdom*, *So's Your Old Lady*.

Efforts on Radio and Television

Second wavers were also concerned with broadcasting, especially radio. Collectives produced feminist radio shows in various cities that often featured women's music, but they also discussed women's issues. Members of these collectives did not necessarily have broadcast experience and the shows never brought in advertising but they were determined to treat a variety of topics from the perspective of women's political struggle. Beginning in 1969, New York's Pacifica radio station offered a weekly news program about the women's movement; WBAI-FM soon added a weekly women's talk show and then a show produced by members of a Consciousness Raising group whose

topics included violence, puberty rituals, housework, masturbation, and monogamy. Members of the Detroit Women's Radio Workshop producing, 1971 to 1981, the show “All Together Now” dealt with provocative issues such as rape, abortion, alcoholism, witchcraft, and female genital mutilation. Women's Liberation Radio News, a radical feminist member-operated collective, hoped to enable otherwise-silenced women to enter the “femisphere.” The Feminist Radio Network formed in the early 1970s to distribute feminist radio programming nationally.

In a 2004 article, Susan Carter argued that the decline of feminist radio collectives reflected the ebb and flow of the women's liberation movement; moreover, once the Federal Communications Commission eliminated certain news and public affairs program requirements, women's radio collectives were no longer needed to satisfy the Federal Communications Commission. Meanwhile, radio stations intended wholly for women audiences failed, also for several reasons, including that by the time of the experiments in woman-centered programming, support for the modern women's liberation movement had already peaked, and a backlash against the women's movement was gaining energy. The women-centered messages also frightened advertisers, who did not want their products to be associated with controversial topics. Now, podcasts largely dominate feminist radio, and many feminist media collectives operate across platforms, which also enables international distribution or access. Women's International News Gathering Service, for example, produces and distributes news and current affairs programs for noncommercial radio stations and live digital streaming.

Television production is difficult, complex, and expensive, essentially making feminist broadcast television prohibitive. In 1996, in the interests of public awareness of feminist positions and a forum for feminist analysis of national policy issues, the National Organization for Women (NOW) discussed possibilities for feminist television. But the idea stalled. Even public access cable shows, with their relatively low production values, require the coordination of many trained volunteers willing to focus on process over content. The one continuing feminist public affairs cable television show, now also on YouTube, has been

produced since 1994 by the National Organization for Women's New Jersey chapter; *New Directions for Women* features interviews with guests on a wide range of issues, including debates over pay equity, feminist activism, women convicts, sexual slavery, domestic and dating violence, minority sexualities, same-sex partnerships, and discrimination of various kinds. Many feminists agree that feminist news is and should be interesting to men; and *New Directions for Women* has invited men to discuss male feminists and stay-at-home dads.

Feminist Journalism of the Third and Subsequent Waves

The Internet is now the premier space for feminist content and activism. The low costs of entry, production, and distribution, design plasticity, and potential for online feedback and interactivity allow for experimenting in the name of individuality, self-expression, and choice. Meanwhile, with printing and mailing costs being prohibitive and independent and feminist bookstores dying out, feminists are abandoning other platforms. Feminist online magazines, blogs, and social media such as Twitter all can draw attention to issues such as sexual harassment (most dramatically, with #MeToo) and advocate for marginalized people. Instagram, tumblr, and Facebook also carry feminist news (and advertising) feminist organizations, projects, and campaigns.

Among the other relatively serious, even somber feminist magazines online are Everyday Feminism (EF), launched in 2012 with the goal of applying feminism to help people heal from and stand up to everyday violence, discrimination, and marginalization due to gender, sexual orientation, race, class, size, ability, and other social differences. EF's numbered lists in headlines—3 Differences Between the Terms “Gay” and “Queer” and Why It Matters; What's Wrong with Cultural Appropriation? These 9 Answers Reveal Its Harm; 6 Tips for Making Your Conversations About Reproductive Rights More Trans-Inclusive—echo a trope of conventional women's magazines. But the similarity ends there. EF's feminism is also intersectional; that is, it recognizes how social categories such as race, class, and gender create overlapping and interdependent

systems of marginalization, discrimination, or oppression. EF also run fee-based webinars on such topics as Transformative Justice in the #MeToo Era; and it supplements its revenues with advertising and membership programs.

Although feminists increasingly seek a transnational culture, few outlets are genuinely transnational, much less available in multiple languages. But a few actively attempt an international approach. Launched in 1975 as a quarterly emphasizing human rights, and especially female genital mutilation, Women's International Network News is a global participatory communication system by, for, and about women of all backgrounds, beliefs, and nationalities. Women News Network boasts of its professional standards and code of ethics in offering international women's news. Using freelance volunteers from around the world, Women's eNews distributes news about women's issues globally to individual subscribers and commercial media in English and Arabic.

Most of the emerging opportunities for third-wave feminist journalism emphasize sassiness, edginess, or at least humor, in their attempts to sustain a global women's network. Perhaps the best-known of the feminist sites is Jezebel, whose slogan when it was launched in 2007 by Gawker Media was “Celebrity, Sex, Fashion for Women. Without Airbrushing”; indeed, on its first day of operation, Jezebel offered a \$10,000 reward for the best example of a magazine cover photo before it was retouched for publication. It was always willing to skewer women's fashion magazines (although its original leaders came from those magazines). Within 9 months, Jezebel was attracting 10 million monthly page views and a variety of major advertisers; indeed, it inspired other feminist sites of feminist critique and commentary and, in terms of popularity it surpassed Gawker, which had forbidden Jezebel from being explicit about feminism. Once it was bought by G/O Media, a hedge fund-controlled group with a stable of publications, Jezebel's new slogan became “A Supposedly Feminist Website.” Now politics is much more central; Jezebel carries not only gossip and popular culture news, updated daily, but also video commentaries and features about the politics as well as, these days, a daily politics roundup. Jezebel has been publicly taken to task for a variety of publishing decisions, such as when, in 2012,

it exposed the identities of teenagers who posted racist tweets about President Barack Obama's reelection. Upon leaving Jezebel in 2010, founding editor Anna Holmes, who is Black, challenged white feminists' commitment to intersectionality and criticized the women's blogosphere, calling it an insular, protective, environment.

BUST describes itself as the Voice of the New Girl Order and "for women with something to get off their chests." Unlike second-wave feminists, who refused to answer to "girls," third-wave feminists are apparently sassy girls. *BUST*'s cofounders sold the magazine, launched in 1993, to Razorfish and then bought it back when it went out of business. *BUST*, which offers print and online subscriptions, supplements its advertising revenue with craft fairs at which vendors pay a small fee.

Similarly, *Bitch*, whose slogan is Feminist Response to Pop Culture, offers feminist news and snappy feminist critique, especially of media images of femininity and feminism; it highlights "girl-friendly" media and "girl power." Over the years, as with *BUST*, *Bitch* politics has increasingly displaced fashion. A recent issue, for example, reviewed a book about how Victorian ideals still constrain women and an analysis of how, as a presidential candidate, Amy Klobuchar's treatment of her staff suggested she was no feminist hero; the "feminist news roundup" led with the death of the African American mathematician who calculated Apollo 11's trajectory to the moon. *Bitch* began as a hand-stapled zine in 1996 and went online in 1998. Bitch Media uses money from subscriptions, sponsors, and members to publish a quarterly magazine, daily online articles, and weekly podcasts. According to a 2015 piece, the feminism and pop culture podcasts at Bitchmedia.org get 30,000 downloads a month, and over 375,000 people follow Bitch on tumblr, Facebook, Twitter, and Instagram. *Bitches*'s staff argues that if women choose to reappropriate the word, it loses its power to hurt women. Other Millennial-oriented feminist magazines online share that willingness to use "dirty words" in titles and self-descriptions. Many, for instance, have described themselves as for badass or kickass women. As with the second-wave publications, most feminist online magazines and blogs address specific segments within feminism. They target

different audiences with very different approaches to feminism.

Make/shift, a biannual of feminist journalism, critical analysis, and art by a collective committed to antiracist, transnational, and queer perspectives, illustrates one contemporary difficulty facing collaborative feminist periodicals. Although independent print magazines were already collapsing by 2007, when it was launched, Make/shift's cofounders recollected 10 years later their goal to create a magazine that readers could hold in their hands. Meanwhile, the cofounders wanted to contribute to the generations-long discussions about liberation from the point of view of feminists of color. They had no interest in becoming a feminist media empire or following what they regarded as a "capitalist" model of constant growth. After 20 issues, however, they burned out. Few such efforts in feminist journalism last a long time, given the not-infinite resources of a single founder's time, energy, and money. Dedicated to the proposition that women's lives, women's thinking, women's votes, and women's power matter, *On The Issues: The Progressive Woman's Quarterly*, for example, was published by Merle Hoffman, social psychologist who founded a women's medical center that provided abortions; it featured surgical alteration of genitals, the drug industry, domestic violence. It appeared in print 1983 to 1999, and online 2008 to 2013, before disappearing.

Feminist and Lesbian Blogs Sites

Some blog sites are geared for a highly segmented audience, including as defined by sexuality, taste, or generation/age. AfterEllen applies what it regards as a fun feminist perspective to the lesbian/bi pop culture beat, adding in fashion, sex and dating, with a bit of politics, such as environmental racism in "gayborhoods." A weekly Lez Dish it OUT! offers celebrity news and lesbian topics. On its website, it insists: "We have a solid reputation as a reputable site run by real journalists, conducting insightful, factually correct interviews." *Hip Mama* was begun in 1993 for single, queer, urban, and feminist mothers, taking on the challenges and rewards of creating a progressive family, from raising draft dodgers, guerrilla

mothering, to teen parents; it also sells the books of its founder and editor Ariel Gore. The digital magazine *Fierce Life* promotes self-care and self-love among mothers, encouraging mothers to be and stay smart, ambitious, strong, and sophisticated, which may happen by purchasing their merchandise. Unlike the periodicals of the 1960s, which collapsed from the financial, physical, and time burdens of production, feminist websites often quickly die because they are insufficiently profitable. Some of these magazines are part of large corporations, or at least digital publishing companies, such as VICE.

Whether Internet sites can sustain feminism transnationally and provide the camaraderie that sustained early feminists remains unclear.

Equally aggressive, casual, and third wave are blogs, which also share information as well as enabling, sustaining, and demonstrating the plurality of feminisms, as well as conflicts across them, by race, sexual identity, and political sensibility. The proliferation of sites means, however, that few sites have large or general feminist audiences, and for audiences to find a site with compatible issues and definitions of feminism is often a matter of happenstance and personal networks; they often increase traffic to their own sites by offering reciprocal links and lists, which become outdated quickly. And they have financial problems. Many feminist blogs, especially ones that tackle intersectional feminism have come and gone. Feministing, an independent site founded in 2004, shut down in 2019. At its peak, the site had 1.2 million unique monthly visitors, with ads and reader donations being used to pay its columnists; it had an open platform community site to which anyone could contribute.

Other independent feminist-minded blogs that closed toward the end of the second decade of the 21st century included The Establishment, which noted the Sisyphean difficulty for an intersectional feminist site to earn revenue; and The Hairpin, which had regular features named “Ask a Queer Chick” and “Interview With a Virgin.” Nor was the issue restricted to independent sites run by collectives or by individual women: Vice Media’s site for women, Broadly, was folded into the larger Vice brand, with its former editor in chief of Broadly, saying that this shuttering of feminist

publications contributes to the long history of erasing women’s work.

As seen on the website Hashtag Feminism, which curates, documents, and archives online feminism, diverse feminists use hashtags as a cheap, quick, easy way to share, collect, and archive news—and counter-narratives—and thereby raise awareness of relevant issues. Notably, in 2006 the community organizer Tarana Burke created the phrase “Me Too” to promote empowerment through empathy among women of color who had been sexually abused; in 2017, the phrase, and hashtag, became key to an international campaign to expose the ubiquity of sexual harassment and assault. These affordances do not guarantee success and feminist journalism as described here rarely can produce large-scale investigations and cannot alone accomplish all feminist goals.

Future Challenges and Prospects for Feminist News Media

Print media continue to be relatively easy to produce. Relative to television or radio broadcasting, or film, they require little capital investment, few technical skills, or access to complex, expensive technologies. These can be, and usually are, produced by a few people without professional journalism backgrounds. Feminist newsletters, pamphlets, journals, and magazines may embrace primitive production values on principle. Meanwhile, they greatly encourage readers’ submissions. Moreover, because politically alternative print media require little money to produce, and do not need to charge much (especially since the goal is not making a profit), people can work for the sake of the project, unconcerned with appeasing advertisers. But because distribution is not free, feminists need to be innovative in subsidizing and pricing their publications to make them accessible.

Personality and political rifts have dealt some fatal blows. Some feminist media died when participants were diverted by other causes, new jobs, or families. Fractures within feminism have created dissension within postfeminist journalism and vitriol across outlets. Furthermore, although major bookstore chains and supermarkets may

carry Ms., the rare hybrid, the others can only be found at independent and/or feminist bookshops, a dying breed. Internet sites would seem to avoid most of these problems, but are beset by technical issues, nor does equivalent camaraderie emerge among Internet content producers. Finally, some have suggested that publications specifically for, about, and edited and written by feminists, are less important at a time when mainstream publications are willing to hire feminists and run stories with a feminist tilt. Still, across feminist news media, producers and readers have enjoyed a sense of community among their loyal, if frustratingly small, audience.

Depending on the goal, some platforms or technologies are better than others. Information about upcoming events is easily tweeted while digital magazines and blogs are good for stirring up activism around social (in)justice. Feminists are using these various media to keep feminisms front and center, to highlight intersectionality's intellectual strength and political edge, and to redefine what is newsworthy. Taken as a whole, these outlets help women inhabit and celebrate new identities, find one another and sustain a sense of community, and win respect for their causes.

FIRST AMENDMENT

The First Amendment to the United States Constitution reads, “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.” In practical terms, the First Amendment prohibits the government, and officials acting on behalf of the government, from limiting anyone's free expression. What seems like a simple rule is extremely nuanced. If all government restriction on speech were prohibited, things like libel or deceptive advertising could not be punished. Laws can punish speech that threatens or harasses on the premise that expression is protected, but actions are not. Regulations can be created that restrict the time, place, and manner of speech (such as noise ordinances limiting volume at certain times of the day or sign ordinances limiting the size and placement of billboards) as long as the rules are content neutral.

This entry examines the history of the First Amendment, and its interpretation, guaranteed freedoms, values, and application. It begins by surveying some 21st-century challenges to the First Amendment.

21st-Century First Amendment Challenges

The First Amendment restricts only government action that restricts speech, so all private actors are free to restrict any way they like without running afoul of the First Amendment. On one hand, decisions by social media companies to block any comment or user are not violations. On the other

hand, a government official who seeks to block others who want to speak on social media platforms is in violation of the First Amendment. The gray area involves government officials who want to block others on what the officials claim to be their *personal* (not government) platforms. Courts have asserted that if government officials (including the president) use their social media for official business, they must allow unfettered access.

When free expression is limited, it usually occurs because of a conflict with another constitutional right. Courts are forced to “balance” between the conflicting rights and choose a winner. A frequent conflict occurs between free expression and national security. In times when the country is afraid, it tends to favor security over free expression. The U.S. Secret Service sometimes establishes “free speech zones,” purportedly to protect the safety of those in attendance at controversial gatherings. Critics claim these areas are established to keep protestors away from not only political figures but also from media coverage. Since the terrorist attacks of September 11, 2001 and the establishment of the Department of Homeland Security, government has won in balancing the need for security with free expression. Free speech zones had been created at many universities during the Vietnam War as a way to limit protests, but most constitution scholars believe those restrictions are unconstitutional and a number of universities have begun eliminating such policies.

President Donald Trump repeatedly accused media of publishing “fake news” and threatened to sue media outlets, even referring to the media as the “enemy of the American people.” He suggested that networks should lose television licenses because of unflattering stories. He called for stricter libel laws, seemingly not understanding that the cornerstone of the First Amendment is the ability to criticize public officials.

History

The first 10 amendments, known collectively as the *Bill of Rights*, were passed by Congress on September 25, 1789 and became part of the Constitution on December 15, 1791, when Virginia became the 11th state to ratify. The Constitution

requires three fourths of the states to ratify amendments.

Then First Amendment was not created by any individual, but if anyone can be most credited for its proposal it would be James Madison. Madison worked tirelessly in support of a new constitution. When opponents feared that the new document did not do enough to protect individual liberties, Madison assured them that once a new constitution was in place, he would champion the cause of amendments that would address protections. True to his word, in 1789 Madison proposed 19 different amendments. His proposal included one amendment, “No State shall violate the equal rights of conscience, or the freedom of the press, or the trial by jury in criminal cases,” combining some of the current First and Fifth Amendment rights. The Senate did some rewriting and consolidating to reduce the list to 12. What is now the First Amendment was actually third in the final slate submitted for ratification, but the first two proposed amendments (dealing with the size of voting districts and representatives’ salaries) were not ratified.

Interpretation

The U.S. Constitution is not an explicit list of rules but rather a framework. There is lots of room for interpretation (and reinterpretation) over the centuries, and the Supreme Court of the United States has overturned earlier decisions after the passage of time and a new interpretation of a constitutional provision has been applied. The First Amendment can be seen as the declaration of the importance of free expression.

The First Amendment is generally considered to protect “free expression,” but it is composed of protections for five different forms that expression takes: religion, speech, press, assembly, and petition. Some people contend that there are actually six freedoms because the freedom of religion is expressed as both the freedom from government imposition of a religion and the affirmative right to exercise one’s own religion.

As with all the Bill of Rights, the First Amendment restricts only government behavior. “Congress” in the amendment is interpreted to mean any form of government. When the founders used the term *Congress*, they did so because the

Constitution established Congress as the branch of government that created laws.

Whether the restrictions of the First Amendment also restricted the actions of *state* government officials was a matter that was not resolved for some time. Whether the framers intended for the First Amendment to restrict state action had never been discussed by the courts. The first time the Supreme Court heard a case that involved the First Amendment came in 1876 in *United States v. Cruikshank*. A majority of the Court ruled that the First (and Second) Amendment did *not* apply to the states. The holding would not become the accepted standard, however. Many legal scholars of the time (and since) believed that the Fourteenth Amendment, adopted in 1868, made the Bill of Rights applicable to the states as well as the federal government. The Thirteenth, Fourteenth and Fifteenth Amendments are collectively known as the *Civil War Amendments*. They became part of the Constitution in 1865–1870 in an effort to protect rights of former slaves. The relevant portion of the Fourteenth Amendment states:

No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

Whether the First Amendment applied to states between 1791 and 1868 is a moot academic discussion, but since 1868 the rights were undoubtedly protected. The Court first asserted this in 1925 in *Gitlow v. New York*, dealing with free speech, *Near v. Minnesota* in 1931 (free press), and *De Jonge v. Oregon* in 1937 (free assembly and the right to petition).

Thus, the current accepted meaning of “Congress shall make no law” is a prohibition on all government officials from the president down to local school principals. Anyone acting on behalf of the government is prohibited from restricting free expression.

However, the First Amendment does not prevent the restriction of free expression by private, nongovernment actors. Twitter can block a user, a newspaper can refuse to accept an advertisement,

and privately owned businesses can prevent employees from wearing buttons to work that promote a political cause. Any of these restrictions taken by a government official would violate the First Amendment, but not if these restrictions are imposed by businesses or individuals who are not operating with government authority. Public schools run afoul of the First Amendment if they start the school day with a prayer, which would involve “respecting the establishment of religion,” whereas private schools are under no such obligation and can include prayer as they like.

Of course, the First Amendment is not an absolute. In 1919, U.S. Supreme Court Justice Oliver Wendell Holmes Jr. famously wrote in *Schenck v. United States*, “The most stringent protection of free speech would not protect a man falsely shouting fire in a theatre and causing a panic.” The assertion that “no law means no law” has never been accepted by more than one or two Supreme Court justices. Justice Hugo Black served on the Court from 1937 to 1971 and is most closely associated with this perspective, but even he did not always take the position that expression should be protected in every instance. In the famous *Tinker v. Des Moines Independent Community School Dist.* case from 1969 that upheld the right of students to wear black armbands to school as a form of protest, Black asserted in his dissent that the First Amendment does not provide the right to say anything at any time. He opined that the armbands constituted a disruption and that school officials had the right to prevent disruption.

The reality is that every First Amendment case requires a balancing of competing rights. Cases that require adjudication involve free expression rights coming into conflict with rights such as the right to a fair trial, the right to privacy, or the right of the government to provide for national security. Judges must decide these cases by weighing the merits of each’s circumstances. While such an ad hoc approach is frustrating to the litigants, it would be impossible to establish a universal rule for settling such conflicts. The Supreme Court has strongly stated that amendments to the Constitution have equal weight to the original document, so no one can claim the First Amendment has a lesser status than, for example, the government’s right to regulate commerce described in Article I.

Some have tried to assert that the First Amendment enjoys a “preferred position” among Constitutional rights. This would imply that free expression rights receive greater consideration when rights come into conflict, but this approach is not universally accepted.

Another complication regarding free expression is determining whether something is a protected form of speech. Speech is protected, but actions are not. It can be confusing because sometimes words can be considered actions and actions can be considered expression. In Justice Holmes’s example, shouting “fire” might be better understood as an action that causes panic. It’s not the expressive nature of the word that the government can punish but rather the action of inciting a crowd that can be restricted. Similarly, actions such as sexual harassment, even if the harassment exists entirely as words, are not treated as speech but action, which is not protected by the First Amendment. Conversely, actions that have expressive intentions might be protected as speech. The wearing of black armbands to school as a form of protest, as was the case in *Tinker*, is one example of just such an action. No words were spoken but the intent of the action was to express an idea: one that some school officials found unacceptable, but which the Supreme Court considered protected “speech.” The Supreme Court has twice ruled that the burning of the American flag as a form of protest is protected free expression, and it was unconstitutional for the state of Texas to try to enforce a law punishing people for flag burning.

Understanding this speech/action distinction might help to understand the Supreme Court’s stance on the punishment of cross burning and hate speech. The Court upheld a Virginia law that prohibited cross burning that was intended to intimidate while allowing cross burnings that instead were intended as political statements. Cross burning as an abstract political statement is considered protected expression, while a cross burning directed at specific individuals with the intent to intimidate them would be characterized as an action and would enjoy no First Amendment protection.

One other controversy has been whether the Framers of the Constitution intended for the First Amendment to prohibit all government restriction of free expression or only prior restraint on publication. Prior restraint is generally considered to be

the most onerous of restrictions on free expression. Historians have noted that the context in which the First Amendment was created made the early Americans weary of government censorship. England had previously imposed requirements that printers receive government licenses, granted only if those printers were favored by those in power. The licenses served as a way to admit only supportive media and to keep them supportive through the threat of a loss of license.

The United States seems to have somewhat settled the dispute by establishing that government restriction that constitutes a prior restraint is subject to strict scrutiny while subsequent punishment is subject to less analysis (intermediate scrutiny). As the name implies, strict scrutiny is the analysis that requires the greatest justification for government action. In 1931, the Supreme Court ruled that a Minnesota law could not shut down a newspaper that had repeatedly violated libel laws. The Court was willing to allow the newspaper to be sued over and over (subsequent punishment) but requiring the paper’s closure (prior restraint) went beyond what was acceptable under the First Amendment.

Five Freedoms

This section lists the freedoms in the First Amendment with brief descriptions of current understanding of their meanings

Religious Freedom

Broadly interpreted, this protection has been referred to as the separation of church and state. Government can neither favor nor disfavor religion or religious beliefs. A city council cannot start meetings with a prayer: that would be “respecting an establishment of religion.” A public university that allows student groups to use meeting rooms must allow religious groups to also use those facilities. To do otherwise would “prohibit the free exercise thereof” [religion]. As with all First Amendment protections, this is not absolute. In 1878, the Supreme Court held that freedom of religion was not sufficient justification to strike down a law banning polygamy. A religion would not be permitted to conduct human sacrifice as a part of a religious ceremony.

Freedom of Speech

The freedom of speech certainly protects the right to speak, but it is more than that. It is also the right *not* to speak. Courts have struck down required loyalty oaths. No child can be compelled to recite the Pledge of Allegiance in school. Individuals who find statements on government-issued license plates to conflict with their conscience must be allowed to cover those slogans. Interestingly, the free speech provision has also been interpreted to include a right to hear, and the right not to be forced to hear. Speakers who are not in the United States cannot invoke the U.S. Constitution to allow them to speak, but Americans can use the First Amendment to assert their right to hear. Courts also protect the right not to hear, in cases where people would be captive audiences.

Freedom of the Press

Whether this clause is actually intended to carve out a specific protection different from the freedom of speech has been a matter of some debate, clearly James Madison intended to protect the media that would provide information and commentary on the events of the day. Some have attempted to assert that this provision provides the press with an affirmative right (beyond just a prohibition), but the Supreme Court has been unwilling to accept arguments that the press should enjoy access that the general public does not (such as prisons), or a blanket provision protecting journalists from having to testify. Shield laws exist in some states, but even those have been ineffective in cases where a journalist's silence is determined to affect an accused's constitutional right to a fair trial. In the 21st century, one of the difficulties of asserting a special right for the press is trying to define who would be included. Trying to determine whether freelancers, or bloggers, or someone simply posting to social media, would be included in a protection for the press would be difficult, to say the least.

Peaceful Assembly

Beyond the obvious right of protest, this is also described as a right of association. The government is not entitled to know the identities of members of organizations without some compelling

reason. Some groups might have trouble recruiting members if people believed their identities would be made public. That was exactly the situation in the 1950s and 1960s with National Association for the Advancement of Colored People membership, and the Supreme Court ruled that the First Amendment protected members' identities. Of course, this protection in no way protects the identities of individuals engaged in illegal behavior, but if groups have unpopular political positions that is not enough to restrict them. While most Americans probably never think about it, the right to belong to a political party—and to switch parties anytime one wants—is part of the right of association.

Petitioning for Redress

Of all the rights in the First Amendment, this is the one also mentioned in the Declaration of Independence. One of the actions complained of in the Declaration is that petitions have been repeatedly ignored. Clearly, the founders wanted to ensure that the new government would be responsive to complaints. The right of petition includes the right to sue the government for the denial of civil liberties. It does not assure that those who petition will win, but it assures that they will not be punished merely for the act of complaining about the government, or to the government. Today the most common meaning of petition might mean a document signed by many people requesting some behavior, and this, too is protected as part of the right of petition, but so is a single person complaining.

First Amendment Values

Determining why free expression is valued helps to determine what should be protected. Various theories have been posited, and none are exclusive. In fact, most scholars recognize that there are multiple values ensconced in the First Amendment.

Marketplace of Ideas

Since at least the 17th century, philosophers have asserted that free expression must be protected in order to create an environment where the truth can be discovered. Since none of us has

a direct pipeline to the truth, everyone should be heard, and people should be able to decide for themselves which ideas are most worthy. The “marketplace of ideas” metaphor invokes the idea of an open market, where “buyers” are able to “shop” for those ideas they prefer from all those being offered. The concept is most closely associated with 17th-century English poet John Milton, who used the phrase in his *Areopagitica*, in which he argued for the right of religious freedom. Political philosophers Jean-Jacques Rousseau, John Locke, and John Stuart Mill were subsequently connected with the theory. History is filled with examples of ideas that were originally rejected and then later adopted by society. Under a marketplace approach, suppression of free expression would damage the pursuit of truth. This reinforces that prior restraints are especially repugnant because ideas that are censored never have an opportunity to be evaluated.

Necessary for Democracy

If a nation allows citizens to vote, it must allow those people to base their votes on information. If voters lack the necessary information to make good choices, the democracy would be at risk. Under a self-governance value of free expression, expression is necessary for an informed citizenry. Legal philosopher Alexander Meiklejohn is most closely connected to this theory, which has been incorporated into multiple Supreme Court decisions. The Court often speaks of political speech as being at the “core” or “heart” of the First Amendment and implying that such expression is more deserving of protection than other forms of speech (such as advertising). Yet other forms of expression besides political speech can impact politics. Works of art, motion pictures, and stand-up comedy often make statements that can impact voters without being characterized as “political.” Valuing free expression because it promotes a healthy democracy requires protecting more expression than just political speech.

Societal “Safety Valve”

Legal scholar Thomas Emerson used a pot of boiling water as a metaphor to help explain his

safety valve value. If a pot of boiling water is covered, pressure will build until the pot bursts. Instead, if the pot slowly “lets off steam” the pot can continue without damage. Similarly, if protest is suppressed, then the whole society is likely to “blow up”; but if people are allowed to “let off steam” by protesting, then society can maintain stability. People who feel they have an opportunity to express themselves are more likely to remain peaceful; those who are frustrated and unable to speak may lash out in violence. Under this approach, governments recognize the danger of stifling protest and instead find ways to accommodate peaceful dissent.

Self-actualization

Many political philosophers have asserted that free expression deserves to be protected because expression is a form of self-fulfillment: it is a part of what makes us human. John Dewey, Immanuel Kant and Baruch Spinoza all valued free expression for its contribution to self-fulfillment. The United Nations founded UNESCO in 1947 and almost immediately it declared the right to communicate a human right. This approach values free expression not for its contribution to truth, or democracy, or societal stability, but rather because of a firm belief that people need to be allowed to express themselves as part of their humanity. Such an approach does not need to determine whether the expression has any extrinsic value. For the individuals expressing themselves, there is value and therefore it is worth protecting.

Watchdog Value

“The press” is specifically named in the First Amendment and as such can claim a unique level of protection. The assertion by Supreme Court justices including Potter Stewart, Louis Brandeis, and Hugo Black has been that the press is afforded protections in order that it act as a “fourth branch” of government, keeping the other three in line. In order to be able to serve as a “watchdog” on the government, the press needs to be protected from intervention by the government. The press, or journalism, or news media, or however one interprets it, is not above all restrictions. Court

cases have made it exceedingly clear that media are subject to labor laws, taxes, antitrust, and other laws that are applicable to any other business. The interpretation of the protection afforded the press is that government may not intervene in editorial decision-making. A landmark case from 1974 struck down a Florida law that required newspapers to provide space for candidates to rebut editorials. The Court did not want the government to decide what was to be included (or excluded) from a newspaper. Despite the fact that journalists can be fined for libel, courts cannot require them to publish a retraction.

Applications

Prior restraint is not prohibited under the First Amendment, but the government faces a “high bar” that it must meet to stop publication before the fact. The famous Pentagon Papers case from 1971 decided that *The New York Times* and *The Washington Post* would be allowed to proceed with the controversial publication not because the newspapers had demonstrated the great value of the Pentagon Papers to the public, but rather because the government had not met the “overwhelming burden” that prior restraint requires. The First Amendment does not require that speakers justify their need to speak but rather requires the government to justify any restrictions on expression. When those restrictions come in the form of a prior restraint, the government must do even more to justify any restrictions. The government had not sufficiently proven the asserted claim that national security demanded censoring the press.

In 1919, the Supreme Court first used the expression “clear and present danger” to indicate the level of analysis necessary before a prior restraint could be enacted. The Court decided in *Schenck v. United States* that the distribution of leaflets encouraging young men to avoid the draft was a clear and present danger. In retrospect, most First Amendment scholars believe the Court misapplied its own test. In subsequent cases, the Court would conclude that the test required more of a causal link between the challenged free expression and a substantive evil (in *Schenck*’s case, hurting the country’s ability to raise an army).

At the other extreme from prior restraints are government restrictions on the time, place, and manner of expression. A city can limit the size of billboards or signs in the interest of the aesthetics of the community. Such a restriction is generally considered to be an acceptable time, place, and manner restriction, provided specific criteria are met: the rule must be content neutral; it must be narrowly tailored to serve a specific government interest; and it must leave ample alternative channels of communication. In the billboard example, as long as the rule does not apply to some billboards and not others, it would be acceptable. Most noise ordinances are constitutional time, place, and manner restrictions. If the rules specified that loud rock music was prohibited but loud classical music was not, the rule would not be constitutional.

Time, place, and manner restrictions are quite common. Cities regulate where and when parades are permitted; public schools create rules for the use of bulletin boards; public universities prohibit protests in certain areas of their campuses. Provided the rules follow the previously specified criteria, they are likely to be found constitutional if challenged. Regulations have been struck down by courts when the rules violated one of the criteria. In 1993, the Supreme Court ruled that a Cincinnati ordinance regulating the placement of news racks was unconstitutional because it granted permits to publications the city saw as more valuable while denying permits to publications it considered simply “commercial handbills.” Clearly, such a rule was not content neutral. One year later, the Supreme Court struck down a Ladue, Missouri, law prohibiting yard signs because the law did not provide adequate speech alternatives.

Despite what appears to be a straightforward admonition on government regulation of expression, there are many nuances to the First Amendment. Free expression is more protected in some venues than others. The Supreme Court has spoken of “traditional public forums,” those places where free expression has historically been protected, such as streets and parks. Because those places have always been venues for free expression, they deserve the greatest degree of protection. At the other extreme is nonpublic forums. No free expression rights exist on someone else’s private property. Even on public property, certain

venues are not public forums. Just because property is government owned does not make it a public forum. The Oval Office in the White House is not a public forum, and neither is the private office of any governor, mayor, or other elected official. Somewhere between the public and private forums is the limited public forum, sometimes referred to as the designated public forum. Limited public forums are those places that do not have to be opened to free expression but that once they are opened, must be treated as public forums. In the seminal limited public forum case, the Supreme Court ruled that Chattanooga, Tennessee, was obligated to allow the use of its auditorium for a production whose message it did not endorse (the rock musical *Hair*) since it had permitted use of the auditorium for other productions. Had the city never allowed performances it would not be required to do so, but once it made the choice to do so it was prohibited from selecting only productions that it liked. The limited public forum manifests itself in a variety of ways. Cities are not obligated to accept advertising on public transit, but once they do they cannot decide to prohibit advertising from abortion clinics. Public universities can designate certain bulletin boards for use only for official notices, but if a board is open to any announcements, the university cannot remove notices it dislikes.

Nothing in the First Amendment explicitly addresses media access to information, but many free expression advocates assert that access to information is critical. When the White House revoked CNN Reporter Jim Acosta's press pass in 2018, widespread criticism followed, until a court order restored his credentials. In spite of state statutes guaranteeing access to government meetings, journalists in multiple states have been denied admission to official meetings either out of ignorance or blatant disregard for legal provisions. Citizens standing in public spaces have recorded law enforcement officers interacting with the public (sometimes violently), and on occasion have been threatened with prosecution.

While many Americans might believe no country protects freedom of expression more than the United States, the Press Freedom Tracker (a service of the international nonprofit Reporters Without Borders) ranked the United States 48th in press freedom in 2019, dropping from 32nd in

2013. Nine journalists had been arrested in 2019, seven for covering protests.

FOOD JOURNALISM

Food journalism tells stories about food and the ways it can shape and be shaped by history, politics, and culture, in a variety of narrative forms, including traditional profiles, features, long-form narratives, breaking news, reviews, how-to, Q&A, as well as the variety of innovative forms

developed for audio, visual, mixed-media, print, digital, social, mobile, and broadcast media. Most often it belongs to the field of lifestyle journalism, which addresses audiences primarily as consumers, providing them with information, instruction, and advice in entertaining ways about goods and services they can use to solve personal problems and enhance the quality of their everyday lives. Yet food journalism also and often crosses the boundary traditionally separating “soft” and “hard” news by covering developments in the various food industries, as well as the personal, local, national, and global politics of food. In fact, taken as a whole, food journalism documents and explores entire foodways, or the web of social, economic, and cultural practices that can accompany food production, distribution, and consumption—practices that are often implicated in politics of class, race, gender, nationality, and religion, and in the politics of exclusion and belonging.

Since the 1980s, food journalism has continued to grow due to its economic success, relevancy to people’s lives, cultural impact, and its effectiveness at building brand loyalty and audience engagement at a time when technological, economic, and social changes within and outside journalism are challenging its traditional sources of authority, its social role, and its professional ideology and practices. This entry discusses culinary journalism, digital media, and audience diversification and offers a brief overview of the history of food journalism. In addition, the entry presents culinary journalism as a type of lifestyle journalism.

Culinary Journalism, Digital Media, and Audience Diversification

In January 1941, *Gourmet*, one of the earliest and longest-running food, wine, and “good living” magazines in the United States, published its first issue under the editorship of Earle R. MacAusland (1890–1980). Its launch signaled profound changes in food journalism, breaking out from the women’s pages in newspapers and magazines that championed Victorian ideologies of domesticity, and embracing instead a modern, masculine, urban, cosmopolitan, and aspirational style rooted in ideologies of leisure and consumption that the new publication exploited, celebrated, and inculcated in its readers.

But almost 70 years later in 2009 when *Gourmet*’s last issue went to press, the print edition of the magazine had lost its edge, succumbing to economic, technical, social, and cultural changes from within and outside the industry. Yet its digital presence remains strong as of 2021, with parent company Conde Nast using the *Gourmet* brand for a Website, cookbooks, special edition magazines (e.g., *Holiday Entertaining*, *Grilling*, *Easy Dinners*), the James Beard Award-winning public television series *Diary of a Foodie*, instructional videos, travel guides, and recipes posted on Conde Nast’s *Epicurious.com*. At the same time, Conde Nast’s *Bon Appétit*, in publication since 1956, continues to publish a print edition while investing resources into their Website, YouTube channel, podcasts, digital newsletters, and social media projects.

While the demise of *Gourmet*’s print edition was deeply mourned, it reflected broader developments in food media and the diversification of food content and audiences. For example, *The New York Times*, which continues to publish recipes, restaurant reviews, food-related profiles, features, and news stories in its print newspaper and magazine, produces *NYT Cooking*, a subscription digital cookbook and cooking guide available on multiple platforms, as well as in-depth interactive, issue-oriented projects such as its 2019 “Your Questions about Food & Climate Change, Answered.” Newspapers and magazines have thus joined an increasingly crowded field of digital offerings, such as *Eater.com* (2005), *SeriousEats.com* (2006), *Food52.com* (2009); podcasts such as the Southern Foodways Alliance’s *Gravy* (2014), *The Racist Sandwich* (2016), and *Copper & Heat* (2019); radio series such as National Public Radio’s *Hidden Kitchens*; and programming such as CNN’s *Parts Unknown* hosted by Anthony Bourdain (1956–2018) and Netflix’s *Chef’s Table*, both of which incorporate ethnographic and journalistic styles and techniques into audiovisual entertainment formats.

From Victorian Domesticity to 21st-Century Lifestyles

When *Gourmet* magazine launched in 1941, its main competitor was *American Cookery*, formerly the *Boston Cooking School Magazine*, one

of the most influential cooking magazines (1896–1947) of its time, and one that represented the cultural ascent of the late 19th century domestic science movement and its most famous graduate, Fannie Farmer (1857–1915), who popularized a new, scientific approach to cooking by introducing precise weights, measures, and methods in printed recipes. The magazine provided instruction for women who wanted to apply this innovative approach at home or who were preparing to teach in the growing number of home economics courses being established across the country.

American Cookery, along with the handful of other food magazines published in the late 19th and early 20th centuries, resonated in content, rhetorical style, and ideology with the cookery columns that had been appearing in the women's pages of American newspapers as early as the 1840s and which had become a staple by the 1880s. These columns offered recipes and advice for women on how to comport themselves as wives and mothers, and how to manage their homes so that they lived up to the demands of the proper, white, middle-class Christian home that became the cornerstone of the 19th-century American "cult of domesticity."

Food writers instructed women on how to prepare thrifty and nutritious meals in an efficiently designed and managed kitchen, and how to serve and consume these meals at a well-mannered table that encouraged genteel conversation, thus nurturing the physical and moral health of their families, which in turn would ensure the health and vitality of the Republic. Later, food writers taught women how to become judicious and guilt-free consumers, taking advantage of new processed foods and household appliances that promised to relieve them of the drudgery of daily housework. In the process, a new image of the ideal American housewife had emerged by the 1950s: a devoted wife and mother, who wisely bought and used modern appliances and processed foods to alleviate her toil, allowing her more quality time with her husband and children. Food journalism contributed to this practical and ideological instruction, and the symbiotic relationship between food writing, the food industries, and advertising that continues to simultaneously support and vex food journalism and other lifestyle genres was established.

Food writing remained largely the province of women's cookery columns in newspapers and magazines through the 1940s. In the prosperity that followed World War II, however, it began to breach its domestic and Northeast confines. The arrival of Henri Soulé, a French chef who in 1941 opened one of New York City's premier restaurants, Le Pavillon, stimulated interest in restaurant and fine dining, while a few writers, notably M.F. K. Fisher (1908–1922) and Clementine Paddleford (1898–1967) researched and wrote stories about the places and people behind both European and American regional cuisines, from Maine to Alaska, Florida to California, and almost everywhere in between.

As an increasing number of post-War Americans enjoyed more leisure time and disposable income, they began to eat out more often and to take an interest in food that went beyond the moralistic advice columns of how to prepare economical and nutritious meals for their families or how to buy and use consumer goods. The recipe columns expanded to include stories that integrated recipes with memoir, travel narrative, and culinary history. While advice did not disappear from food writing, it changed with the times. Women, some of whom had returned from overseas or domestic war service, were encouraged to settle in at home and think of cooking not only as a moral obligation, but also as entertainment and a marker of social status and distinction, and to prepare meals that were not only nutritious but also sophisticated and fun. Men had a circumscribed role in domestic food preparation in their apartment kitchenettes, if they were single, and in their suburban back yards if they were married, where they could grill robust steaks and burgers, without compromising their masculinity. *Esquire* magazine, for example, which began publication in 1939 as a men's lifestyle magazine, ran a food and wine column in the 1940s titled "Man the Kitchenette" by Iles Brody (1899–1953), an entertaining narrative that instructed men how to cook meals to impress—and seduce—their female guests. In the 1950s, Harry Botsford wrote in the same magazine a humorous column instructing his readers on how to use their outdoor grills to tap into and satisfy their caveman impulses.

As interest in food as leisure, entertainment, and education grew in the late 40s, 50s, and 60s,

so did the popularity and prestige of food media, expanding from newspapers and magazines to radio and television, and in the process diversifying its audience. For example, Julia Child (1912–2004), one of the nation's first television celebrity chefs, popularized French cooking at home through her best-selling book, *Mastering the Art of French Cooking* (1961) and through her popular television program, *The French Chef*, which was first produced by Boston public television and then broadcast across the country. At the same time, James Beard (1903–1985) was inspiring respect for American regional cuisines, mentoring professional chefs and cooking enthusiasts through his television appearances, cookbooks, and articles. (Several years after his death, in 1991, the James Beard Foundation gave out its first annual awards, including media awards recognizing excellence in food writing and programming across culinary media and genres.) And in newspapers, Craig Claiborne (1920–2000) was hired in 1957 as the first male editor of the food section of the *New York Times*, where he instituted the restaurant review with its star-rating system, and included ethnic neighborhood joints such as Nick's Greek Diner alongside reviews of the 21 Club, Le Pavillon, Lutece, and other New York City fine dining establishments. Meanwhile at the *New York Herald Tribune*, Clementine Paddleford (1898–1967) covered food stories behind major world events such as Queen Elizabeth II's coronation and Winston Churchill's Iron Curtain speech, the Republican National Convention in Philadelphia and the New York World's Fair, as well as more mundane happenings, becoming one of the most popular and well-known food editors in the country. Her collections of regional recipes joined other early books that treated American cooking seriously, including the works of Sheila Hibben (1888–1964), who wrote the food column "Markets & Menus" for the *New Yorker* magazine, and served as consultant for White House menus under Eleanor Roosevelt.

Food writers continued throughout the 1950s and 1960s to cover and stimulate interest in regional and international cuisines and in cooking and eating as an entertaining, discerning, cosmopolitan, and sociable leisure activity. In the 1960s and 1970s, food writers also began to cover counterculture critiques of the ways food was

produced, distributed, and consumed in the United States and encouraged Americans to think of their engagement with food as political acts. Alice Waters (1944–), who in 1971 opened the now-iconic restaurant Chez Panisse in Berkeley, California, quickly became and continues to be one of the most recognized and effective advocates of ethical eating, supporting local, seasonal, organic, humane, environmentally responsible practices, and advocating for school lunch and food education reform through her Edible Schoolyard and School Lunch Initiative and, more recently, through her influence on the planting of the White House organic garden in 2009 as part of First Lady Michelle Obama's broader campaign promoting healthy eating and exercise for children.

As of 2021, food journalists continue to engage with the politics of food, not only by covering "hard" news stories, but also by covering celebrity chefs who leverage their economic and cultural capital to advocate for political and social reforms in national and international food systems. For example, Rachael Ray (1968–), host of several Food Network programs, cookbook author, and figurehead for Meredith Corp.'s magazine *Rachael Ray Every Day*, leveraged her celebrity to partner with the Alliance for a Healthier Generation, an organization formed by the William J. Clinton Foundation and the American Heart Association, to combat child obesity in the United States. She introduced her campaign on the *Rachael Ray Show* in April 2007 with former President Bill Clinton as her guest. Similarly, celebrity chef Jamie Oliver (1975–) initiated "Feed Me Better," a school meal reform campaign in the United Kingdom that grew from his television program "Jamie's School Dinners." The campaign led to the British government pledging almost \$500 million to improve school lunches. In 2010 and 2011, Oliver brought his campaign to the United States in the form of his television program "Jamie Oliver's Food Revolution." But the celebrity chef with by far the most profound and sustained global influence is Jose Andres, whose NGO World Central Kitchen has provided emergency food relief and humanitarian aid in dozens of areas hit hard by natural and human-caused disasters, as well as developing long-term strategies for alleviating poverty and hunger around the world.

These and other celebrity chefs have used their cultural and economic capital to engage in political activism that simultaneously promotes change as well as their brand. In covering these chefs and their advocacy work, food journalists, many of whom regularly produce lifestyle rather than hard news content, engage with global political challenges, including government and popular responses to refugees fleeing war, natural disasters, and poverty; migrants detained at the U.S.–Mexican border; the effect of climate change on food systems; and the nutritional health of children worldwide, among others. In this way, food journalism blurs the boundaries between hard news and lifestyle journalism, information, and entertainment. It also provides audiences with an avenue for satisfying the desire for civic engagement and a sense of responsible and ethical living, while celebrating the making and sharing of food, and nurturing creativity in the home kitchen.

Culinary Journalism as Lifestyle Journalism

Up through the end of the 20th century, food journalism as recipes, instruction and advice, memoir, travel narratives, and political exposés continued to develop as food and its preparation and consumption became integrated into the ideology and rhetoric of “lifestyle culture.” Indeed, as the concept of lifestyle permeated popular discourse, engaging in the culinary arts by eating out, taking cooking classes, participating in wine tastings, embarking on cooking vacations, building “designer” kitchens, entering cooking and eating competitions, following celebrity chefs, committing to specific food politics (such as shopping at farmer’s markets, eating vegetarian or vegan, buying organically grown fruits and vegetables), and engaging with food journalism and food media became powerful markers of social status and distinction.

Lifestyle media, which includes much though not all of food journalism, has experienced extraordinary multi-platform growth in the first decades of the 21st century, though not without challenges brought on by broad cultural, technological, economic, and professional changes, as the demise of the print edition of *Gourmet* magazine

illustrates. Yet, at the same time, the legitimacy and relevance of food and lifestyle journalism have increased among audiences and scholars. Long treated as a “lesser” form of journalism because of its focus on private, consumer, and leisure concerns as opposed to the public concerns of hard news, and because of its more obvious relationship to advertising, public relations, and industry, in the past 10 years scholars have begun to examine the significant role such soft news plays in ideology and politics. Food journalism, in particular, has provided a robust site for examining questions about what it means to be a citizen and consumer, about the politics of exclusion and belonging, about the exploitation of material and human resources, about structural inequality in the food system, about poverty, hunger, and well-being, and about the performance of gender and other identities. In short, food journalism explores and documents how culture and politics are constituted through encounters with food. Food journalism contributes to food media and food culture, adding to the vast personal lifestyle offerings, but also drawing attention to serious public matters.

FOREIGN CORRESPONDENTS

Foreign correspondents have captured the popular imagination for a long time. Movies, novels, and magazines are rife with representations of lone journalists who trek into dangerous territories with the goal of telling some of the world's most complicated stories. Essential to the drama of these narratives is the idea that foreign correspondents are themselves foreign to the places they are visiting; traditionally, their audiences have been located back at "home," depending solely on these journalists to help them make sense of the world outside their comfort zones.

The reality is much more complicated, however. First of all, the very word "correspondent" suggests that there is someone else with whom the foreign correspondent is maintaining regular contact. As John Maxwell Hamilton notes in his history of American foreign reporting: "The first foreign correspondents were literally that, friendly souls in London or Paris who wrote letters home"

(2011, p. 13). Hamilton is especially referring to the 18th century, when newspapers in the colonies had no official journalists. In the 19th century, there were indeed professional journalists working on the staffs of newspapers; yet, when they wanted to cover wars for their readers, British newspaper editors tended to solicit letters from junior military officers, before finally hiring William Howard Russell as the first civilian correspondent to write letters back to headquarters that specifically covered the Crimean War.

As journalism matured as a profession, so, too, did the relationship between editors and their correspondents. Foreign correspondents were expected to maintain at least some level of communication with employers back at headquarters, though they could also evade their editors more easily than metro or national correspondents could. Many foreign correspondents and news editors say that this changed with the rise of digital communication technologies. Now, correspondents see themselves as much more tightly linked to the large staffs of people with whom they are expected to remain in communication at all times. This entry discusses the differences between freelance and staff foreign correspondents, the role of local support staff, and diversity among foreign correspondents. It then looks at changes in the work of foreign correspondents and news organizations' methods of obtaining news from other countries.

Foreign correspondents who officially work on the staff of major news outlets are especially enmeshed in a broad, digitally connected network of news employees flung around the world. But even freelancers—journalists who are not on any news organization's official staff—tend to be in some kind of contact with editors while they are in the field. Freelancers might pitch their stories to several different news editors while they are still in the process of reporting those stories. They might also be commissioned by a particular news outlet to cover a specific story ahead of time. The difference between freelance correspondents and those who work full time on the staff of a major news organization is one of stability. While staff correspondents are paid regular salaries that include health benefits, freelance correspondents are usually paid by the story. They do not typically

receive benefits from the news organizations that hire them, and they are never guaranteed the protection or support of those news organizations should they find themselves in danger while on assignment.

Another difference between freelance correspondents and staff correspondents is that freelancers—especially the younger ones with less money—do not have the luxury of relying very heavily on local support staff, such as drivers, news assistants, stringers, and fixers. Staff correspondents often do have this luxury, especially when they work with news assistants based at foreign bureaus. News assistants are usually local residents who work at the bureaus, helping the correspondents and bureau chiefs with everything from translation to securing interviews with sources to interpreting different cultural mores. Conversely, news fixers work on a freelance basis as translators and guides to foreign correspondents who are not necessarily attached to a bureau. Finally, stringers are locally based journalists who provide correspondents and their news organizations with stories from places where the staff correspondents cannot (or will not) always go. Without these crucial media workers, foreign correspondents would have a difficult time telling their complicated stories.

This dependence on local collaboration has been a facet of foreign correspondence for quite some time. For example, when *New York Herald* correspondent Henry Morton Stanley journeyed through central Africa in the mid-19th century in hopes of finding the missing missionary and explorer David Livingstone, Stanley enlisted the help of an interpreter and guide. The practice of relying on locals to act as cultural mediators between foreign correspondents and potential news sources has continued to this day.

Yet, unlike in past centuries, the work that news fixers do has become more and more professionalized in the 21st century. There are now websites such as World Fixer, PayDesk, and HackPack, where foreign correspondents can search for fixers and other local media workers' profiles and hire people in the field. These websites have the potential to bring more public visibility to news fixers, assistants, and stringers.

Who Serves as a Foreign Correspondent?

There is another popular misconception about foreign correspondents, at least in the West, though this has slowly been changing. This is the misconception that foreign correspondents are necessarily male. While very little, if any, research has yet been conducted on correspondents who identify as gender-nonconforming, we do know that female-identified journalists have been working as foreign correspondents for well over 100 years. Just in terms of U.S. journalists alone, Margaret Fuller was a correspondent in Europe during the mid-1800s, for instance, and Peggy Hull covered the First World War.

These days, female foreign correspondents are even more active in the profession, and this is not only in the context of reporting for U.S. news organizations. Take, for instance, correspondents like Zeina Khodr, who reports across the Middle East and North Africa region for the Al Jazeera news channel, or Liling Tan, who covers the United Nations for China's CGTN. These accomplished journalists destabilize the stereotype of the "masculine" foreign correspondent.

Female correspondents are more and more common, despite the fact that the profession of international reporting is still very deeply informed by what some journalists have called a "macho culture." In Western journalism, this culture tends to encourage traditionally masculine performances of bravery and emotional control. For this reason, some female journalists prefer to downplay their identities as women, explaining that their gender has nothing to do with how brave or calm they can be in the field.

Other female correspondents might choose to foreground their status as women. Some of these women find that the people who live in the places they cover in their stories tend to see women as being less threatening, which in turn leads the female correspondents to secure interviews with sources who would never talk to male correspondents from another part of the world, or to gain access to restricted areas that police may not allow male foreign correspondents to see.

Women are very much a part of the profession of foreign correspondence, despite the popular portrayal of foreign correspondents as men. There

is also another misguided portrayal of foreign correspondents, particularly in the West. This portrayal suggests that foreign correspondents are somehow always white people. While many of the histories of foreign correspondents (written in the English language) do seem to focus mostly on the exploits of white Americans, Canadians, Brits, or Australians, the fact is that people of color have long been engaging in the practice of international newsgathering.

For instance, in her groundbreaking 2013 book on the history of African American correspondents, Jinx Broussard discusses George Washington Williams, an African American man who traveled to Africa to see if mainstream journalist Henry Morton Stanley was bolstering negative myths about the people on the African continent. She also tells the stories of Wallace Terry, Thomas A. Johnson, and Ed Bradley, African American correspondents for the mainstream U.S. news media during the war in Vietnam. Broussard's book helps to remind journalism scholars and practitioners that there is a long history of racial diversity in the profession of foreign correspondence.

It is crucial to note that the people who do the complicated work of foreign news reporting are not always citizens of the countries where their news organizations are based. For one thing, while the stringers, news assistants, and fixers mentioned earlier are not necessarily native to the places where foreign correspondents hire them as collaborators, they are often understood—and tend to “sell themselves”—as having close cultural ties with the people on the ground. These people, who play a vital role in the work of foreign reporting, not only complicate the very “foreignness” of “foreign” correspondence, but they sometimes also destabilize the Western image of foreign correspondence as a white Westerner's job.

This image perhaps becomes even more unstable in the cases where journalists who are either from the regions to which foreign correspondents travel or from neighboring regions begin working on the staff of major international news bureaus. These journalists might begin as news assistants but later earn the coveted title of “foreign correspondent” when they are not entirely “foreign” to the places where their news bureaus are located. Take, for example, Nabih Bulos, a Jordanian

journalist who started out as a news assistant for the *Los Angeles Times* in Beirut. Bulos eventually became one of the *LA Times*'s official foreign correspondents. The involvement of journalists like Bulos in “foreign correspondence” suggests that the very phrase “foreign correspondent” is perhaps inadequate for describing the various people who engage in the labor of international news reporting.

Shifting Methods for Gathering Foreign News

The term “foreign correspondent” may also sound a bit outdated when considering the intensifying economic, technological, and political challenges that international news workers face in the 21st century. For one thing, the economic landscape in which international journalists work has become more and more precarious. The turn of the 21st century saw major news organizations slashing their foreign news budgets and closing many of their foreign news bureaus. This was partly because of broader economic crises affecting the news industries, first in the wake of the industrial conglomeration that arguably reduced many news outlets to mere departments of larger media companies geared toward entertainment. Legacy print and television news organizations also found themselves struggling to reckon with the rise of digital media in the late 1990s and early 2000s, especially corporate news outlets that relied on advertising to fund their journalism and were unable to make up for losses in traditional advertising with online advertising. The economic recessions of the mid- to late-2000s also hit news organizations hard, and both corporate and publicly funded news organizations struggled to maintain their bottom lines.

Within this context, foreign reporting began to seem more like a luxury than a public service. News editors started relying all the more heavily on freelancers who they could not afford to support or protect. In turn, news editors also started relying heavily on Internet users who generated free news content and posted it on the web. This practice has continued into the 2020s. Those producing this content, known as *user-generated content*, are typically not professionally trained journalists, but they might have taken some

compelling video of an important world event. More and more, we tend to see international news outlets using videos and photographs that were captured by these “citizen” journalists. Unlike staff journalists and freelancers, the “regular people” who post their content online rarely get paid by the news organizations who use their images. This is why it’s so cost-effective for news outlets to rely on user-generated content.

News organizations also increasingly rely on another highly cost-effective type of content—that produced by international nongovernmental organizations who engage in humanitarian or human rights work. Since many of these organizations commission freelance journalists to capture images and to gather information from various sites of struggle around the world, some news editors now believe that it is appropriate to use this material in their publications’ international news reports. This is despite the fact that organizations such as Human Rights Watch or Amnesty International have a very specific agenda, one through which they hope to persuade a global public of the need to act in a certain way on behalf of certain people. For this reason, news organizations’ use of material commissioned by international nongovernmental organizations has certainly led some to question whether this particular type of international journalism can claim to be “objective.”

It is important to remember, however, that objectivity is a fairly young concept in journalism, and its value also changes depending on a variety of factors, such as geopolitical region, type of news organization, and the topic being covered. The economic and technological changes to the profession of journalism at the turn of the 21st century have greatly destabilized the news industries’ unproblematic belief in objectivity, where that belief ever actually existed at all. In some parts of the world, journalism is understood as a practice that is supposed to serve the people by serving the interests of the state. In other parts of the world, telling the news from a first-person perspective has long been the preferred way of relating to news audiences.

Even before the rise of digital technologies, foreign correspondents struggled with the concept of objectivity particularly because they are, by definition, supposed to be immersed within the story. Whether news organizations rely upon the

testimonies of professional staff correspondents, professional freelance journalists, or digital citizen journalists, they are drawing upon a specific perspective—a perspective that is circumscribed by the correspondents’ very presence at the scene. The people who cover crises such as war, political dissent, or natural disasters have especially suggested the difficulty of detaching themselves from the people in the field and obtaining a “God’s eye view” of what is happening in those situations. What is more, the increasingly mobile digital technologies that can enable correspondents to get closer to the action can in turn make it more difficult for them to leave the story safely. Sometimes, correspondents end up *becoming* the story themselves, especially when they get hurt on the job.

Not only have changing economic structures and digital technologies impacted the already beleaguered concept of objectivity in foreign correspondence, but these issues have impacted foreign correspondents’ work in other ways as well. The Internet has made it possible for both news practitioners and news audiences to encounter journalism produced in drastically different socio-political contexts than their own. This means that foreign correspondents increasingly find themselves writing about people who can see their reports as quickly as the correspondents’ own audience can. Yet, these people may not agree with the way they were portrayed in the story, a problem that can lead foreign correspondents to be criticized or even attacked in the field. The growing interconnectedness of people from disparate cultural backgrounds through digital convergence can in turn result in a deep sense of disconnection at the most fundamental levels. The foreign correspondents of the 21st century must constantly negotiate between these moments of connection and disconnection.

It remains to be seen whether foreign correspondents will continue to capture the public imagination in the 21st century. Perhaps by the century’s end, the term “foreign correspondent” will be considered archaic. It may be that communication about culturally and geographically distant events is changing so drastically that there will soon be no need for the journalists who travel great distances to report on people and places for audiences located elsewhere. Yet, it is far more likely that this important type of journalism will

continue to exist, even as it is deeply complicated by changing economic, technological, and political landscapes.

FOURTH ESTATE

Fourth estate is another name given to the press, or news media. In the 18th, 19th, and much of the 20th century, it referred to the print news media. Later it began to be used to refer to all news media, including print, broadcast, and digital.

The term *fourth estate* is often used to refer to the news media's role as a watchdog over government. The term is pervasive in Western culture, having been used as the title of a journal, a novel, and a television documentary series, among other uses. The student newspaper at George Mason University in Virginia is titled *Fourth Estate*. In the

21st century, the term *fifth estate* has sometimes been used to refer to nonprofessional citizen journalists who write and record information and opinion in the digital environment, many of them bloggers, usually for no profit.

In the West, especially in the United States, many have expressed concern over what they see as a decline in the power of the news media to exercise the fourth estate's watchdog function. Some news media critics maintain that the news media will soon cease to exert a watchdog function at all, allowing even democratically elected governments to rule with impunity and to establish the same sort of totalitarian or autocratic societies that exist in much of the world. This entry first discusses the origin of the term *fourth estate* and the development of this model in the United States. It then looks at how the idea of the press as fourth estate has been affected by commercial interests, the loss of local newspapers, and the Internet. Finally, it discusses mass communication research on the power of the fourth estate.

Origin of Term

According to Thomas Carlyle (1840), British political philosopher Edmund Burke first used the term in a speech about the opening of the House of Commons to the press. Carlyle paraphrased Burke as saying:

There were three estates in Parliament; but, in the Reporters' Gallery yonder, there sat a fourth estate more important far than they all. It is not a figure of speech, or a witty saying; it is a literal fact—very momentous to us in these times. Literature is our Parliament too. Printing, which comes necessarily out of Writing, I say often, is equivalent to Democracy: invent Writing, Democracy is inevitable. (p. 194)

Burke went on to say that the press could give voice to anyone in a democracy; hence, such communicative power represented a fourth estate. In other words, the publication of information and opinion in the press would have some effect on politics. Indeed, Burke believed those effects were not insubstantial and that published words in newspapers and magazines become part of public discourse.

An American variation on this in political terms is that the federal government is divided into executive, legislative, and judicial branches, with the press assuming an oversight role as the fourth branch. The primary function of the news media is to inform the public about the actions of the three branches of government—which would be passed down to the state, county, and municipal levels as well. Over time, this fourth branch would also inform the public about other powerful entities in society, including corporations, churches, and even the press itself. The fourth estate is not part of the explicit government structure. Rather, its power and responsibilities are indirect and assumed. In some European nations, the term used is slightly different—fourth power.

In the U.S. system, journalists record and reflect on public affairs. Under the watchdog function, they are situated as being over and against government—or, at least, willing to take on such a role if need be. The press keeps an eye on government activity and transmits to the public such activity. This includes actions that show political and economic leaders in less than favorable light. Because of this positioning, journalists and government officials are often at odds in the public sphere.

Political leaders from Vice President Spiro Agnew, who called journalists the “nattering nabobs of negativism,” to President Donald Trump, who calls journalists the “enemy of the people,” have attacked the fourth estate as noisome and unfriendly. Such political figures as Agnew and Trump also have seen the press as unequal and passive in their relationship with elected officials. In such a view, the observer role of the press is seen as being beneath the dignity and weight of the government official, especially those who stand at the top of government's three branches. Political leaders have to act, while journalists react. With such an understanding of the press, those in government positions often will build up obstacles to make it more difficult for journalists to perform their professional duties. Despite this adversarial relationship, journalists consider their oppositional position to powerful individuals and institutions to be necessary in a democracy.

Such confidence in the press as an essential element of society comes directly out of the Enlightenment quest for truth. It is part of the Western

belief in individual or human rights—which are not respected in much of the rest of the world. The idea of a fourth estate is enshrined in both the U.S. First Amendment, which prohibits Congress from abridging press freedom, and in the French Declaration of the Rights of Man and of the Citizen, which states that the free communication of ideas and opinions is “one of the most precious of the rights of man.” American political leaders James Madison and Thomas Jefferson believed that press freedom and the watchdog function would guarantee a safe society.

The theory behind the fourth estate is the concept that an external, independent press, free of government interference, holds government accountable, leading to a responsive government and open, free society where ideas and opinions circulate freely—as opposed to a totalitarian society in which ideas and opinions are handed down from above by the government or are not handed down at all. Maintaining a watchdog role, the press helps create an environment of transparency in a society. As the fourth estate, the press is in a position to ask questions of the powerful, to provide, in effect, petitions of grievances from citizens to government.

In 1975, U.S. Supreme Court Justice Potter Stewart claimed that the Constitution guaranteed the “institutional autonomy of the press.” The main purpose of the press clause in the First Amendment, Stewart (1975) held, was “to create a fourth institution outside the government as an additional check on the three official branches” (p. 634). In other words, the press would cast light on both government achievements and wrongdoings. Stewart said the level of independence and freedom for the U.S. press was based on avoiding the narrow function found in the British system, where the press had faced censorship and licensing for centuries. Stewart wrote:

The British Crown knew that a free press was not just a neutral vehicle for the balanced discussion of diverse ideas. Instead, the free press meant organized, expert scrutiny of government. The press was a conspiracy of the intellect, with the courage of numbers. This formidable check on official power was what the British Crown had feared—and what the American Founders decided to risk. (p. 634)

Yet since the mid-20th century, the U.S. news media have been criticized for failing to live up to such a mission because commercial factors and the drive for profits have interfered with their watchdog function. For example, in the reporting done by Edward R. Murrow in the 1950s on Senator Joseph McCarthy and his witch hunt against communists in the U.S. federal government, CBS ownership refused to support the show financially. Murrow and producer Fred Friendly had to solicit advertising to pay for the presentation, which had a relatively strong effect on public opinion and had some role in McCarthy’s downfall. In the United States, with the exception of some major national newspapers (such as *The New York Times* and *The Washington Post*), the watchdog function is being lost, and there is a need for a new model for a vital news media to take the place of the 20th-century model. Some newspapers in contiguous geographic areas are working together now to share the investigative function. However, the bigger issue is the so-called news deserts where local newspapers simply do not exist anymore. This is especially problematic in places that have no local television or radio news outlets.

Walter Lippmann, a government propagandist during World War I who became a prominent journalist, stated that the average citizen does not have enough time in a normal day to digest all the information coming from a society’s major institutions. The journalist, therefore, sifts through vast quantities of information independently and tries to analyze and interpret it with a set of professional standards and guidelines. Reporters, for example, attend board meetings and press conferences, and they then transmit to the public what has transpired. Thus, the fourth estate functions in a way that reporters shine a light on powerful entities, both individual government and business leaders, as well as powerful institutions, such as corporations, medical facilities, universities, and even media empires.

Lippmann’s view of the press led, in the early 1970s, to the creation of a model called the *agenda-setting function of the press*. Developed by university mass communication professors Max McCombs of the University of Texas and Donald Shaw of the University of North Carolina, agenda setting claims that the news media do not dictate

how citizens think about issues, but rather they tell them what to think about in the first place. McCombs and Shaw (1972) studied the effect of mass media content on voters in Chapel Hill, North Carolina, during the 1968 presidential election and found that “the media appear to have exerted a considerable impact on voters’ judgments of what they considered the major issues of the campaign” (p. 180). In other words, newspapers, magazines, television, and radio establish what issues, policies, events, institutions, and individuals deserve our attention.

On the front page of a newspaper or in the first few minutes of a broadcast, journalists choose the items that consumers will perceive to be the most relevant—the few items out of that many that consumers need to know about on a particular day, week, or month. Similarly, certain sources of those news items tend to have relevance and resonance, such as the American president, major corporate leaders, prominent scientists, international dignitaries, and celebrities. The agenda-setting function is not explicitly stated in the Constitution; however, the McCombs-Shaw model assumes an independent institution that holds a mirror up to government and other powerful institutions, as well as individuals, to show society their thoughts and actions.

Development of the American Model of the Fourth Estate

The American model of the fourth estate is guaranteed in practice by virtue of the fact that the news media are commercial in orientation and therefore not reliant upon the government for subsistence. The watchdog and agenda-setting models depend entirely on the financial health of the commercial press. The political orientation of the editorial page and government subsidy (printing contracts and postal benefits) have played less and less of a role in American news institution’s independence since the end of the Civil War in 1865.

Between the ratification of the Constitution and the end of the Civil War, for the most part, the American press was political in its orientation, as many newspapers were started and maintained as party papers. The weakness of such a system was that the newspapers aligned with the party in

power would be less willing to act as watchdogs. In other words, those organs were dependent on financial solvency from their relationship with political parties and on subscriptions from those of a similar political stripe. On the other hand, the minority party newspapers were more likely to inveigh against the government and be more likely to shine a light on government affairs than those of the majority party. This majority–minority model meant the majority publishers were more likely to claim press freedom for newspapers and magazines of the same party, while denying the same rights to the minority.

A more independent model had begun to sprout in the 1830s with the penny press, which put more emphasis on economic success and less on party orientation. Indeed, the *New York Herald* would be the model for much of the American press as the 19th century wore on—a strong newspaper with an independent-minded owner-editor, James Gordon Bennett, who confounded both political parties. Yet the vast majority of American newspapers remained political in orientation as the divide between the North and South widened in the 1850s, culminating in the start of the Civil War in 1861. In 1860, approximately 80% of U.S. newspapers were still partisan in orientation.

The development of a more independent press accelerated after the Civil War. Hundreds of Democratic journals in the North had faced suppression during the war, and few of those editors wanted to relive those days. Editorial independence offered a more reliable way to maintain stability. Furthermore, the reconciliation of the two sides after the war led to a period of a realization that political orientation was not the best way to manage the financial status of a journal. Rather, increasing independence from political parties with an emphasis on advertising promised more financial stability. Gradually, politics was downplayed, and a division between the news and editorial sections grew over time, creating a wall whereby the news reporting was relatively free from editorial (opinion page) influence.

Commercialism and News as Entertainment

A problem with the press relying on the free market system is that news as a commodity has a

relatively low value. Entertainment sells better, so a model of news that is more entertainment than mere information took hold in the 1980s and has continued to dominate news media operations. This focus on making sure that news media entertains as well as informs is often blamed for having diluted the overall quality of journalism and contributing to less public awareness of civic information.

Critical scholars such as Noam Chomsky and Edward S. Herman maintain that the weakening of the watchdog function makes the news media more like a willing partner in the manufacture of consent that government and corporations need to maintain the social contract. In their 1988 book, *Manufacturing Consent: The Political Economy of the Mass Media*, Herman and Chomsky maintain that the mass media essentially function as propagandists, not watchdogs, not only because of the basic capitalist structure of the press, but also because of using as sources government and corporate officials, as well as experts who are within the very institutions being investigated or explained. For Chomsky and Herman, the news media are more lapdog—or even guard dog—than watchdog.

Similarly, Robert W. McChesney has lambasted the news media for being hyper-commercial and more interested in ratings and rates of circulation (or online page views) than with the creation of engaging, relevant, and expository journalism. McChesney notes that the American news media are primarily owned by major corporations that have major lobbying arms and exercise a large share of the gatekeeping function on public consumption of the news. Meanwhile, the conglomeration of news media into ever smaller near monopolies has gutted competition, which had been the hallmark of American journalism before the 21st century. McChesney (2012) also maintains that American journalism is in a “freefall collapse” (p. 614) and argues that without a rethinking of the entire media system, democratic governance will no longer be possible.

Loss of Local Newspapers

In the 20th century, the emphasis was on developing financially healthy news operations to guarantee noninterference from government. This would

ensure that the news media could function as a fourth estate. As long as the vast majority of American news organizations maintained economic stability, this model worked well, but beginning in the early 1960s, this approach began to see fraying around the edges for newspapers and magazines as television news began to assert itself. In the 21st century, the financial instability of a huge number of American newspapers and magazines left many pockets of the country without reliable local newspapers, or with so-called ghost newspapers that have almost no original reporting. Penelope Muse Abernathy, a University of North Carolina journalism professor, has counted more than 2,000 lost newspapers in the United States in the first two decades of the 21st century.

The concept of the press as the fourth estate with a watchdog charge is not explicitly guaranteed in the U.S. Constitution. Rather, the American news media have assumed it over time, and their success in shining a light on government and corporations built up some degree of public confidence in the news media. At best, however, the watchdog function of the news media is tolerated by government and often is held in contempt. The idea of the press as government watchdog is a claim it makes for itself based on its role in uncovering government wrongdoing, including through the work done by investigative journalists in the so-called Progressive era at the end of the 19th and beginning of the 20th century, the reporting of *The New York Times* on the Vietnam War, and the vigorous reporting by Bob Woodward and Carl Bernstein of *The Washington Post* in the Watergate investigation.

Influence of the Internet

At the start of the 21st century, some journalists and scholars hoped the Internet would create a more powerful fourth estate as a wealth of information from a variety of sources became more accessible both to professional journalists and ordinary citizens. There were grand dreams that a second Enlightenment would materialize as the Internet ushered in a new information age, one with enormous potential. For the most part, these dreams have not come to pass, and the revolution inaugurated by the Internet has created a

counterrevolution in which national governments have adopted cyber laws that make it a crime to publish inconvenient facts or political ideas that differ from those in power.

In a 2004 op-ed, Jürgen Krönig, London correspondent for the German newspaper *Die Zeit*, argues that two strong factors, sensationalism and simplification, drive the 21st-century news media. The need for more images and more videos dominates legacy newspapers as they have converted to the Internet. In fact, *The Independent* runs videos first on its website; text stories are seen as complementary. For many news outlets, hard news is the coverage of weather disasters, scandals, and health scares. Krönig states that the electorate now is most informed about celebrities, entertainment items, and consumer information, while being far less interested in or simply cynical about politics.

Power of the Fourth Estate

For their part, mass communication researchers tend to downplay the power of the fourth estate. The McCombs-Shaw theory was part of a revolution of minimal effects research from the 1960s and 1970s that continue to dominate mass communication research in the 21st century. The popular ideal of the press as powerful, for either good or bad purposes, was deconstructed by minimal effects scholars. Such theories do not take into account the power of bully pulpit leaders like President Donald Trump, who bypasses the news media and sends messages to the public via social media, or the power of a monarch, autocrat, or single-party state that only allows a compliant press to exist. Little research has been done on how the messages of the mass media of 21st-century totalitarian states affect their audiences.

Fox News

Fox News is a U.S.-based 24-hour conservative cable news service. With 80 million subscribers, it has been, according to its website, “the most watched television channel for 19 consecutive years.” As such, it has had a significant impact on American journalism, media culture, and political life. This entry explains this impact by way of tracing Fox’s history as a product of movement conservatism as the critical nexus between conservative think tanks, political activists, and media personalities. The performative style of Fox’s conservative journalism and the audience populism it engendered culminated in the rise of Donald Trump to the U.S. presidency.

The story of Fox’s history necessarily revolves around its founding chairman and CEO Roger Ailes, who presided over the network from 1996 to 2016 as an extension of his role as a key Republican media strategist. From his position at

Fox, Ailes was able to shepherd the forces of movement conservatism to effectively challenge liberal cultural hegemony in journalism and beyond. The conservative grievance at the heart of Fox News is perceived liberal media bias. Combating liberal cultural and political elites has been a wildly successful formula for Fox in dominating market share and cultivating a loyal audience primed for Fox's hybrid model of entertainment and populist campaigning.

A crucial conjuncture for Fox was the ascent of Barack Obama to the presidency, the need for web 2.0 audience strategies, and the increasing autonomy of Fox hosts outside the auspices of the network. This created the conditions for Trump to supersede Fox's role within conservative politics and for audiences to migrate to more undisciplined parts of the far right.

Movement Conservatism

Journalism studies normally regards different news organizations and styles of journalism as shaped by the culture of the professional field combined with market and regulatory contours. While important factors, Fox News might best be thought of as an extension of movement conservatism and later as its primary vehicle. Ailes himself was a key Republican media strategist during the historical period of backlash conservatism spanning the Richard Nixon and Ronald Reagan administrations. Dating back to his 300-page memo to Nixon "A Plan for Putting the GOP on TV News" and his distribution network of conservative broadcast content Television News Incorporated (1971–1975), funded by right-wing beer magnate Joseph Coors, Ailes sought to bypass what he saw as the liberal gatekeepers of network journalism. This set the template for Fox's regional market strategy of affiliates and the role of business activism in subsidizing the costs of conservative media production.

In this period, Ailes's vision of broadcast journalism as a vehicle for GOP politics was unfolding alongside the development of a conservative media, intellectual and lobbying infrastructure. The so-called Powell Memo of 1971, written by Lewis Powell prior to his appointment to the Supreme Court by Nixon, was a cohering moment for this movement. Powell wrote of the need to

protect America's "free enterprise" system said to be under attack by intellectuals and the media as unwitting communist fifth columnists. The memo rallied the political activism of the U.S. Chamber of Commerce with the creation of right-wing think tanks such as the Heritage Foundation and Cato Institute subsidising and training future conservative scholars, journalists, and liberal media watchdogs. Conservative media voices flourished as a result of this business activism and lobbying efforts toward the Federal Communications Commission allowing for corporate consolidation and the repeal of the Fairness Doctrine. The resulting media deregulation was to the benefit of right-wing talk radio, which would serve as a fecund training ground for Fox talent. The largesse of Rupert Murdoch's News Corp also fuelled Fox's aggressive acquisition strategy of local affiliates and a bold market entry in 1996 through payments to cable providers to carry the network.

Ailes and Fox would come to sit astride the broader currents of movement conservatism, shaping its popular narratives and making television spectacle central to the backlash against the liberal cultural elite. The cliché example of television's impact on American politics is the transformation of Nixon from a victim of John F. Kennedy's telegenic charms in 1960 to bridging his emerging silent majority via television in 1968. Ailes was integral to this effort, creating staged debates with meticulously selected "ordinary" Americans that aired in regional television markets in order to get around what Ailes perceived as liberal censorship and go directly to the people. With Fox, Ailes established a permanent Republican campaign through a televisual spectacle of anti-journalism.

Fox was at war with liberal journalism but also the high-brow trappings of traditional right-wing media institutions such as National Review by addressing its audience not as dispassionate truth-seekers but an aggrieved populist public. The programming innovation of Fox was a patina of straight news during the day, centered upon conservative talking points, which fed into a prime-time schedule of pugnacious right-wing opinion hosts such as Bill O'Reilly and Sean Hannity. As of June 2021, Hannity continues to star at Fox while O'Reilly and Ailes were forced out after a

series of sexual misconduct allegations and settlements came to light in 2016–2017.

Fox House Style

The journalistic style, or what Pierre Bourdieu would call *habitus*, produced by this convergence of conservative political forces was a populist pugilism as part of a permanent Republican Party culture war. Fox presented its mission as combating liberal bias and reclaiming the values, or cultural capital, of journalism through a market populism. The slogans “#1 in News,” “Most Watched, Most Trusted” and the browbeating of opponents over ratings by hosts like Bill O’Reilly made winning the ratings war a participatory demonstration of conservative cultural power. While winning was a first-order principle, there is a veneer of journalistic cultural capital in the claims to be “Fair & Balanced” or the slogan “We Report, You Decide.” The underlying populist inflection of these journalism maxims is neatly evinced by the Fox Nation streaming service. The site’s mission statement reads:

The Fox Nation is committed to the core principles of tolerance, open debate, civil discourse, and fair and balanced coverage of the news. It is for those opposed to intolerance, excessive government control of our lives, and attempts to monopolize opinion or suppress freedom of thought, expression, and worship. (Jutel, 2013)

For the general Fox viewer, any statement of journalistic principle is inseparable from culture war and railing against liberal media. O’Reilly was a key figure in this regard, cultivating a *habitus* as an experienced member of the industry appearing to level with his viewers about the reality of *The New York Times* and what the “pinheads” don’t want you to know.

The success of this formula and Fox’s dominance in cable news is inextricably linked to the presidency of George W. Bush. The attacks on September 11, 2001, and subsequent wars proved the military and political campaigns that would enable Fox’s cultural ascent. The transformation of news into the equivalent of what journalist Matt Taibbi has described as sports media “hom-erism” played out on Fox on a civilizational scale

in the “war on terror.” While the Iraq War and weapons of mass destruction were a defining journalistic failure for *The New York Times* and others, Fox’s measure of success was not related to journalistic veracity but its decisive role in transforming American culture and the spectacle of war. If the first Gulf War was a broadcast event defined by CNN’s detached *habitus* of technological precision, then Fox’s ratings conquest was staked on actively participating in “smoking out” the enemy. From the Stars and Stripes graphics splashed across the screen, long-serving correspondent Geraldo Rivera’s pledge to personally shoot Osama bin Laden or O’Reilly’s denunciation of war critics and the French as in bed with terrorists; this was a spectacle premised upon the populist enjoyment of striking back at foreign and domestic enemies. The effect of Fox’s success represented a fundamental recentering of journalism and politics around this patriotic fervor. MSNBC fired its highest rated host, the anti-war Phil Donahue, fearing that the network would be seen as unpatriotic.

Audience Populism

Fox’s role in coalescing modern movement conservatism through televisual spectacle has had the effect of reorienting conservative political networks around Fox. Fox has become an important site of power with the ability to launch the careers of politicians, authors, activists, and various conservative celebrities. Conservative politics has been folded into Fox’s ratings logic and what might be called *media entrepreneurialism* now dominates all aspects of conservative political networks. Access to Fox’s politically activated viewership and the performance of a populist authenticity have become the defining commercial and ideological imperatives of conservative movement politics.

Trump’s regular appearances on the programs *Fox & Friends* and *The Sean Hannity Show* were key in seeding his presidential run, itself more of a brand campaign than a committed ideological project. In the case of former Fox host Glenn Beck, his performance as a populist true believer and strong ratings allowed him to launch his own network TheBlaze and bring more unruly and radical forms of right-wing populism onto Fox.

This is the tension that would define Fox in its role at the center of movement conservatism with activated audiences proving unruly and unpredictable.

This dynamic was set in motion by the need to rebrand the conservative movement under the Obama presidency from the failed martial triumphalism of Bush into a small government populist insurgency. This period also coincided with Fox and News Corp's forays into web 2.0. New engagement strategies based on social media participation and the retention of audiences across platforms corresponded to the task of forging this new conservative identity. Thus, in 2009 Fox coordinated the Tea Party movement, which turned viewership into a form of political activism and protest.

In bridging the Tea Party through exuberant live broadcasts of protests, Fox created a nexus between its hosts, key lobbying groups such as Freedom Works, and an activist audience that would extend conservative networks into emerging web 2.0 platforms. Audiences participated in a lucrative closed loop for Fox News and conservative media entrepreneurs, as they produced the very spectacle of protest that they consumed as Fox viewers. This model of free and affective labor around media and political brands would become the basis of Trump's presidential campaign in 2016. It would also push the boundaries of Fox content past the liberal bias critique and culture war trifles such as the "war on Christmas," into anti-Semitic and John Birch Society conspiracies that would culminate in the rise of the alt-right.

Fox's vanguard populist personality in this period was Glenn Beck who at his ratings peak in early 2010 threatened to catch the top-rated *O'Reilly Factor* despite a timeslot outside prime-time. Beck's innovation was to present his show as a form of revolutionary education constantly enjoining his audience to "do your own research." In his performances, he delivered 20-minute monologues fanning white racial anxiety of Obama's "socialism" and designating George Soros the "puppet master of a cultural Marxist plot." Beck represented a high point in Fox's populist anti-journalism spectacle as a Howard Beale-like figure weeping for his country, prophesizing apocalypse, and professing love for his

audience of patriots. This performance of authenticity was effective in plugging viewers into Tea Party online communities and his other media ventures beyond Fox. It was this affective performance of populist authenticity that allowed Beck to function alongside former Republican vice presidential nominee Sarah Palin, herself now a Reality TV star, as a de facto Tea Party leader with protests on Washington, DC. Beck left Fox in 2011 due to a sponsor boycott of his show for his anti-Semitic attacks on Soros and statement that Obama has a "deep-seated hatred for white people." For Fox and movement conservatism, the Tea Party pivot proved highly effective, as evidenced by Fox's unbroken ratings triumph, the 2010 midterms, and a decline of Democrat control of state houses and governorships under Obama to levels not seen since the 1920s. Fox's logic of the permanent campaign, increased audience autonomy, and the incentives for media entrepreneurs to push boundaries has precipitated a radicalization of the party base seeking a maximalist approach to governance. Having been primed to view Obama as an existential threat to the republic, the Tea Party caucus in Congress were incapable of accepting victory, most significantly rejecting the so-called fiscal Grand Bargain which aimed to cut Social Security and Medicare, long-running conservative goals.

The tension between an activated conservative base and a programmatic legislative agenda has swung decisively toward the base, as the Republican Congressional caucus itself is increasingly made up of insurgents or disciplined by the political activism of Fox's populist audience. Fox's success in turning viewership into a form of mobilization for movement conservatism has empowered this base to indulge in maximalist political rhetoric and conspiracy as their own ends.

The significance of Trump is not merely as a beneficiary of conservative networks and Fox's media power but the manner in which he exceeds and undermines them. Able to draw on his activated base of social media followers and with media capital by virtue of his celebrity, he engaged in a populist politics of grievance, conspiracy, and spectacle largely detached from conservative institutional power and centered around himself. The critique of liberal bias became Trump's

denunciation of fake news, a charge which Fox itself has not been immune to. Relations between Fox and Trump have been chequered with Trump's misogynistic attacks on Megyn Kelly, his boycotting of a primary debate in 2016, and his accusations of being abandoned by Fox during his attempts to overturn the 2020 election. His propensity for conspiracy and embrace of fringe radicals has buoyed online movements such as the alt-right and QAnon.

Researchers have spoken of the "Fox Effect" with the network misinforming audiences around issues such as climate change or weapons of mass destruction, which were tied to specific and rational Republican objectives, however cynical. The "Trump Effect" on conservative networks has been to subsume its politics to media fantasies about battling antifa, cultural Marxism, and Obama's "deep state" in perpetuity. The legacy of Ailes's coalescence of conservative networks around Fox has been to create a form of media power that while defining conservative politics can no longer be corralled to advance coherent political interests, let alone anything resembling journalistic values. What Bourdieu (1998) decried as television journalism's "populist spontaneism and demagogic capitulation to popular tastes" (p. 48) has in Fox News become the pure spectacle of far-right fantasy.

FRAMING

As a mass communication theory, framing describes the active process of creating, selecting, and shaping aspects of reality in communicative texts. The results of this dynamic activity are called *frames*. This entry first examines the ways in which framing has been defined and goes on to trace its theoretical roots in various disciplines and identify the core processes and underlying paradigms in framing. Next, the early works that shaped the field of study are reviewed and subsequent research explored. The entry concludes with a brief discussion of the ways in which scholars have critiqued the concept of framing and argued for new approaches to the field.

To paraphrase a landmark 1993 definition by scholar Robert Entman, frames perform a variety of tasks, such as defining social problems and their causes, emphasizing certain moral judgments, and promoting particular solutions or policy decisions. Since its inception in the early 1970s, framing has become an oft-used theoretical framework in the study of journalism and mass communication and one of the most utilized mass communication theories of the present era. As sociologist Gaye Tuchman (1943–) explained in her book *Making News*, the framing metaphor suggests that news functions as a window through which audiences learn about the world outside. But such frames are problematic—like any window, the view afforded depends on the size and

construction of the frame as well as the viewer's vantage point in relation to the frame.

Framing has theoretical roots in several fields, including mass communication, sociology, political science, and psychology. As a social scientific theory, framing functions as a bridge among diverse perspectives and across disparate research paradigms, from empirical-positivist-quantitative studies to critical-interpretive-qualitative work. Framing is lauded for its versatility in crossing these intellectual divides. Furthermore, framing is a term that is used in everyday speech in ways that resemble its theoretical use, lending the concept a degree of face validity.

Framing's theoretical utility stems from the notion that frames exist at all levels of the communication process. The individuals creating content bring their own mental frames (or *schemata*) to the table. The professional norms and routines of the journalism industry—such as the emphasis on conflict and timeliness—manifest themselves in media frames. Elites and social movements are influential frame promoters who battle to establish the dominant framing of an issue, and the political and cultural contexts of a society are reflected in these dominant news frames. Finally, the audiences who consume content carry their own frames, which may be reinforced, challenged, or changed through their exposure to frames in media content.

In 1999, Dietram A. Scheufele explicated four core underlying processes that encompass framing: the *frame building* activities undertaken by influential parties who hope to shape media discourse; the *frame setting* effects that stem from the interaction between journalist frames and the audience; the *individual-level processes* involved in audience-level comprehension of frames; and, finally, the *interpretive feedback loop* that results from the fact that journalists are also audience members embedded in the same culture as the rest of the audience. When considered across those distinct processes, framing's greatest potential is to illuminate a holistic picture of public opinion formation and change—from the antecedents of content, through the conditions that influence characteristics of content itself, to the effects of content on the public.

However, this very versatility also has led people to criticize framing as a “fractured paradigm”

that lacks rigor or internal consistency. As such, even as researchers continue to investigate the process of framing, there remain overarching theoretical and methodological questions to be addressed. Scheufele, along with Michael A. Cacciatore (1981–) and Shanto Iyengar (1947), have urged scholars to abandon the use of the general term *framing*, instead encouraging researchers to focus on specific types of framing—namely, research that focuses on equivalence versus emphasis.

Paradigmatic Approaches to Framing

Generally, framing research falls within three main paradigmatic approaches: cognitive, critical, and constructionist. In the *cognitive* paradigm, researchers examine the ways in which media audiences' knowledge and experience connect with news frames. This approach focuses on the impact that different ways of wording a message has on individual-level understandings. It has been critiqued, however for being unrealistic in that people do not confront frames one at a time, but rather all bundled up.

The *critical* paradigm, on the other hand, focuses its attention on issues of domination and power relations that undergird the practice of journalism itself. Critical framing scholars argue that the very processes and structures of journalism favor the ideologies of the elites who dominate media discourse. Critical framing scholars are interested in the ways communicators consciously or unconsciously construct particular points of view that encourage certain interpretations by making some facts more noticeable than others. These frames naturalize certain interpretations so they become taken for granted. Thus, critical scholars are acutely aware of the voices that are missing from the dominant discourse.

The *constructionist* paradigm tends to consider news frames as products of a social environment in which communicators and audience members act in dialogue with one another. From this point of view, frames aren't inherently interesting, but rather they gain meaning for what they can tell us about the circumstances of their creation and which particular realities they emphasize. The constructionist paradigm was summarized by

Rens Vliegthart (1980–) and Liesbet van Zoonen (1959–) in a series of axioms: frames are multiple and can be oppositional; they are part of a struggle for meaning between actors with unequal resources; they are the result of routine processes; and the frames used by audience members are socially situated and combined with other social processes.

Although these are distinct strands of framing, there are also some overlaps. Both the constructionist and critical paradigms are interested in the power relations that media content represent, while both constructionist and cognitive paradigms are curious about the effects of different frames on social actors. As such, it is probably more useful to look at framing as a field in which the paradigmatic borders are porous.

Early Works

The origin of the framing concept is attributed to Gregory Bateson (1904–1980), who introduced it in 1955 to describe a psychological structure that delimits a set of actions. However, sociologist Erving Goffman (1922–1982) is widely credited with launching framing as a coherent area of study. Goffman's 1974 book *Frame Analysis* did not explicitly deal with news content, but Goffman's ideas were quickly seized upon by sociologists who were interested in the ways news coverage contributed to—and reflected—the social construction of reality. This first group of scholars who applied the framing concept to news production included Tuchman, as well as Herbert Gans (1927–), Todd Gitlin (1943–), William Gamson (1934–), and Andre Modigliani.

In this early strand of work, framing was not conceptualized solely as an issue of media content, but rather a common part of everyday existence as people negotiate, manage, comprehend, and respond to reality. Importantly, this process of the social construction of reality is facilitated and influenced by the industrialized and routinized production of content by mass communication companies. Timeworn journalistic conventions like conflict, objectivity, and timeliness are central to the construction of news storylines, but these are value-laden concepts that are often reflective of the corporate arrangements that govern them. Even as framing research began to shift through the 1980s

and 1990s, several conceptual definitions from this era—notably those by Goffman, Gamson and Modigliani, and Gitlin—remain frequently used by researchers.

Framing as a Media Effect

In addition to the sociological strand of framing research, there is a broad swath of cognitive research that examines the psychological effects of news frames. In particular, such researchers use framing to examine the effects of persuasive messages on individuals. Research suggests that news frames have the power to shape audience interpretations of issues and events through the selection and prominence of some information and the exclusion of other information. Sometimes news frames contain cues that discuss issues in terms of losses or gains, which in turn shapes social judgments and decisions.

In a series of landmark studies, Amos Tversky (1937–1996) and Daniel Kahneman (1934–) examined *equivalency framing*, which presented research subjects with alternative framings of issues that were mostly equivalent, but that emphasized different aspects of the story. Unlike earlier eras in which powerful media effects were believed, the cognitive paradigm does not envision such automatic effects. Rather, in this context, the effects of frames are mediated by their *accessibility* (i.e., the extent to which the audience member has existing mental models that relate to the frame) as well as the importance that the audience member places on an issue. Individuals possess cognitive dimensions—frames in thought—that influence their evaluations of issues that either match or are in opposition to the frames in communication.

Framing as Patterns of Emphasis

Another turning point was marked by Robert Entman's 1993 conceptual definition of framing as the selection of aspects of a perceived reality to “promote a particular problem definition, causal interpretation, moral evaluation, and/or treatment recommendation” (p. 43). While this is far from the only conceptual definition of framing, it has emerged as the dominant one, in part because of its effectiveness for content analysis.

Unlike the equivalency framing studied in the cognitive paradigm, this definition was more consistent with *emphasis framing*, which focuses on which stories media workers select to tell, and which aspects of those stories are highlighted. News frames are often the result of competitive processes among social movement actors and political elites to have their preferred explanations and solutions become the most accepted by media actors and, later, the public. In the battle for motivating citizens to take action, the side that wins the framing battle often wins the war. Building on Entman's definition, Jörg Matthes (1977–) and Matthias Kohring (1965–) proposed that frames can be conceptualized as *patterns of frame elements* that cluster together over a corpus of media content. Iyengar examined different presentations of information on audience judgments and choices, focusing on two types of generic frames: *episodic frames*, which depict issues as specific instances; and *thematic frames*, which depict issues in more broad and abstract terms by placing them in some context.

The frames emphasized in media content can also be compared to the frames promoted by social actors or the public. For example, Entman's *cascading activation* model explains the ways interpretive frames are activated and spread among top-level officials, non-government elites, news organizations, and the public—and the ways in which feedback from lower to higher levels of the process shape debate.

Applications of Framing

Framing is related to *agenda setting*, particularly in the area of *attribute agenda setting* (also known as *second-level agenda setting*). While the original conceptualization of agenda-setting theory posited simply that the topics emphasized in news coverage would become more salient for audiences, the second level of agenda setting is concerned with the cognitive and affective attributes of those topics that are emphasized. When it was first proposed in the late 1990s, second-level agenda setting was described as a combination of framing and agenda setting. Put simply, it examines the extent to which the frames that are emphasized in news coverage causes an increase in salience of those frames among members of the

audience. Framing also relates to *priming*, which is the increase of salience at the individual levels.

Limitations of Framing

Despite—or perhaps because of—framing's popularity, it continues to suffer from theoretical weaknesses, including inconsistency in its application, disagreement between the study of generic or issue-specific frames, and a general lack of research that examines framing across multiple levels of the process. Some of these weaknesses come from discrepancies in conceptualization. Is framing a theory? A paradigm? A multiparadigmatic research program? A media effect? A rhetorical perspective? It has been referred to as all of the above in the literature.

There are conflicting perspectives on how to solve this conceptual conundrum. Entman called for greater coherence in framing in his 1993 essay lamenting framing's status as a “fractured paradigm.” Paul D'Angelo responded that framing is better understood as a multiparadigmatic research program that benefits from a diversity of approaches. Given the multitude of views represented by the framing literature, it is perhaps unrealistic to hope for a resolution in the form of a single parsimonious conceptual definition of framing. However, D'Angelo proposed what he called the *hard core* of framing for scholars no matter what perspective they are working in. This hard core suggests that framing studies must do one or more of the following: identify thematic units called *frames*, investigate the antecedent conditions that cause frames, examine how news frames activate and interact with individual prior knowledge to influence interpretations, and study how news frames shape social level processes.

A second main theoretical weakness in framing research involves the level of abstraction at which frames are examined; that is, whether the research has identified generic frames that can be generalized across time, topic, and location; or whether it looks at frames that were identified for a specific context and cannot be generalized. This presents a dilemma for researchers: whether to conduct a detailed analysis with that is not generalizable, or take an all-purpose approach that is useful for

building theory but that loses the rich detail of a specific case.

The third major theoretical deficiency in framing theory is related to the relative paucity of studies that integrate the different parts of the framing process. Framing has been widely proposed as an integrative model, and scholars laud its utility as a versatile research paradigm. But in the published literature, there is very little evidence of scholars actually looking at framing across parts of the process—from the antecedents of framing in particular coverage through to published frames' impact on a particular audience.

FREE DAILY NEWSPAPERS

While there is a long tradition of cheap, advertising-supported newspapers, free daily newspapers exploded around the world in the 1990s as publishers sought to reach younger audiences increasingly disconnected from traditional news media. Typically published 5 days a week, these newspapers' reliance on advertising makes them particularly vulnerable to economic downturns. As of mid-2020, free daily newspapers were being published in 28 countries, including some newspapers that suspended distribution of printed copies for the duration of the coronavirus shutdowns, which decimated both advertising receipts and distribution networks.

Free daily newspapers tend to be produced by small staffs (often no more than a half dozen journalists), printed in a tabloid format, with relatively low page counts. Some reduce publication during holidays, when advertising is sparse. This entry first reviews the business models of free dailies, their origins, and the decline of free dailies in many markets. It concludes with a discussion of how free dailies seek to reach new audiences and the challenges they face.

Business Models

There are two distinct business models for free dailies. The best-known free dailies serve large metropolitan areas, often distributed through mass transit systems, offering a mix of lifestyle and entertainment coverage targeted to younger readers and which can be read in 20 minutes or less. Two chains, Metro and Schibsted, pioneered this model, but it was imitated by many established publishers hoping to expand their brand and advertising reach, or sometimes merely to fend off potential competitors.

A second model targets a very different niche: residents of small cities without consistent news coverage, often in the shadow of major urban centers. Broadcast media and metropolitan dailies often provide regional and national advertising and news to these towns, but cannot effectively provide localized information. A few free dailies have become circulation leaders in their countries, notably *Fréttablaðið*, which has become Iceland's leading newspaper, and Britain's *Evening Standard*, which converted from paid circulation in the face of intense competition.

Origins

There is a long history of advertising-dependent cheap papers, dating back to the late 1700s. The 1800s saw waves of penny newspapers as publishers sought mass audiences with a combination of more popular fare and a nominal price. But, at least in the United States, most newspapers were always dependent upon advertising or other subsidies to cover the costs of news gathering, printing, and distributing.

There are competing claims to the first daily free newspaper. Some scholars point to Australia's *Manly Daily*, established in 1906, as the first. Early nameplates label the paper a "gift," though later editions often featured a price.

In 1978, David Danforth began a mimeographed news sheet, the *Aspen Daily News*, which quickly expanded into a professionally printed tabloid produced by a modest staff. The weekly *Aspen Times* launched its own daily edition in 1988. With some 7,500 year-round residents but a thriving tourism industry, Aspen was the smallest U.S. city to support competing daily newspapers,

both free, as of 2020. Danforth later helped launch networks of small, community-based free daily newspapers with a heavy emphasis on local news in California and New Hampshire.

In 1995, a chain of free newspapers was launched by Metro International on a very different model, targeting younger urban audiences with dailies distributed largely at mass transit hubs. Metro was soon joined by Norwegian-based Schibsted's *20 Minutes* papers. While insisting that individual newspapers were profitable, Metro reported substantial company-wide losses before going private, and both chains retrenched after 2009.

By 2007, free newspapers accounted for a quarter of European newspaper readership and were the most-read daily newspapers in several countries. Europe accounted for nearly two thirds of global circulation of free dailies, with 133 titles in 31 countries, and many cities served by three or four titles. Advertising plummeted with the global recession in 2008, and many titles were merged or closed. Today, only 11 European countries have free daily newspapers: Austria, Belgium, Britain, the Czech Republic, France, Iceland, Italy, Luxembourg, Portugal, Spain, and Switzerland. Only four have more than one title (though many issue regional editions), and the preeminent scholar of the field, Piet Bakker, argues that few markets can sustain more than a single free daily newspaper.

Retrenchment

Entirely dependent upon advertising revenues, free newspapers were hit hard by the recession. Several small town dailies closed or reduced publication schedules. Metropolitan newspapers that had added free dailies to broaden their outreach in cities, including newspapers in Chicago, New York City, and Washington, DC, closed or sold them. Swedish-based Metro International sold or closed newspapers across Europe and North America, focusing its efforts on Latin America, often in partnership with local publishers. Some former dailies survive as online sites or weekly titles.

At one point, free daily newspapers served Baltimore, Boston, Chicago, New York City, Philadelphia, San Francisco, and Washington, DC. Today only one of New York's three free dailies survives, alongside a much-reduced *Metro Philadelphia*

(Metro sold both titles in January 2020; the *San Francisco Examiner* also survives, publishing 3 times a week). There are also free dailies serving Aspen and Vail, Colorado; Conway and Laconia, New Hampshire (separate papers under common ownership); Jackson Hole, Wyoming; and Palo Alto and Santa Monica, California. Student newspapers like Ann Arbor's *Michigan Daily* have extended coverage to their communities after local dailies closed.

In Canada, there were once competing national and local free dailies. As of 2020, the only free newspapers published in Canada were two French-language papers in Montreal, one owned by publisher Quebecor and the other by the owner of a regional print distribution firm.

In Great Britain, *Metro* (owned by the Daily Mail and General Trust) and the *Evening Standard* have substantial national circulations alongside the much smaller London business daily *City AM*, but a dozen competitors have failed. In Spain, the number of titles fell from 34 in 2006 to one (in four regional editions) in 2020. In Switzerland, there were eight free dailies in 2008 but as of 2020, only *20 Minuten* (now in local hands) remained, albeit in several regional editions published in French and German.

Malaysia's *The Sun* converted to free distribution in 2002 and became that country's leading English-language newspaper. Hong Kong is served by two Mandarin-language and one English-language free newspapers, all owned by local publishers.

Some free newspapers have been established for partisan purposes. *Israel Hayom*, owned and heavily subsidized by U.S. gambling magnate Sheldon Adelson, employs a large staff and is Israel's most-read daily newspaper. But it has never been a commercial venture; rather, the paper exists to undermine Israel's traditional newspapers and to push Israeli politics to the right. In Kenya, *People Daily*, owned by a media company associated with President Uhuru Kenyatta, switched to free distribution in 2014 in an effort to become the country's circulation-leading newspaper.

Latin America was somewhat late to the field but has seen two rounds of new launches and consolidation. It is the only region where the growth of free dailies has been accompanied by a broader increase in newspaper circulation (which was low by

international standards). Eleven countries have free daily newspapers, often with several regional editions, published by an existing paid newspaper or in a joint venture with Metro International. There are multiple titles in Argentina, Brazil (one national), Chile (one national), Colombia (two national), the Dominican Republic, Mexico (two national), and Puerto Rico. Metro Intl. has daily papers in six countries (typically with a local partner), as well as a weekly in Puerto Rico. But even Latin America has seen a sharp decline in free dailies, from 38 titles in 2012 to 21 in 2020.

Free Dailies and New Audiences

Studies exploring the impact of free dailies on paid circulation find that they reach readers who rarely purchase traditional newspapers. The number of newspaper publishers who continued issuing free papers after driving competitors from the field tends to support that conclusion. However, efforts to draw a specialized audience with sports or business titles, evening editions, or more substantive news coverage have generally failed. The most notable exception is in Iceland where the home-delivered *Fréttablaðið* offers coverage comparable to many paid dailies, sometimes publishing 80 pages or more.

Profitability in the sector has proved difficult to sustain, however, particularly in competitive markets. The most durable titles are part of larger publishing groups that can support business and editorial operations. Britain's *Metro*, for example, can draw upon its owner's national distribution and printing network, advertising sales staff and other resources. Free-standing dailies have found it more difficult to sustain publication, lacking the resources to weather temporary downturns in advertising.

For many markets, the costs of charging for distribution (both actual costs and opportunity costs of readers foregone) outweigh the potential circulation revenue. However, free newspapers are entirely dependent upon fickle advertising receipts and face strong competition from other free media outlets.

FREE EXPRESSION, HISTORY OF

In early modern Europe and North America, many conflicts over freedom of expression occurred, occasioned by the development of the printing press, on the one hand, and democratic theory on the other. By the twentieth century, a standard history of these struggles had become canonical for political theorists as well as for the occupations that are most invested in freedom of expression—lawyers, publishers, librarians, academics, religious activists—and journalists.

Journalism as a practice and an institution has been fundamentally shaped by these struggles. Positioning itself as the gateway between governments and their publics, journalism has defined itself in part as the instrument people rely on to acquire the information they need to protect themselves from and to participate in government; journalism also has thought of itself as

representing the voice of the people. The culture of journalism pivots on struggles over government control of information and expression. Journalism's identity relies on a collective memory about its role in continually expanding the area of free expression.

Conceptualizing the Notion

Several different approaches to the history of freedom of expression are common. The oldest and best established is a liberal approach, sometimes called the “Whig theory of history.” This theory begins with the premise that power, including the power of government, is always hostile to individual liberty. In the Whig theory, history is the story of the continual advance of liberty. This viewpoint is rooted in liberal political philosophy, which holds that liberty advances because people are free by nature, and “ideas want to be free” as well.

The 1956 book *Four Theories of the Press* by Fred S. Siebert, Theodore Peterson, and Wilbur Schramm put forward one variant of the liberal approach. It identifies a “libertarian” theory of the press, which has confidence in the rationality of free individuals and proposes that minimal government interference will be the best policy for a media system. It contrasts the libertarian theory with the “authoritarian” theory on the right and the “Soviet communist” theory on the left, which both call for massive oversight and leadership of the media system. The *Four Theories* model is somewhat different from the “Whig” model inasmuch as it sees the rise of the mass media requiring a modification of “libertarian” theory into a fourth theory, the “social responsibility theory.” The social responsibility theory distinguishes between the freedom of expression of *persons* and the freedom of the *media*, and concludes that the latter is derived from and justified only to serve the former.

On the opposite end of the political spectrum, there is a series of critical—as opposed to liberal—approaches to the question of freedom of expression. These approaches dispute a key point shared by liberal theories: that the realm of ideas and expression is relatively autonomous from the realm of material wealth and power. The classic expression of this position comes from German social scientists Karl Marx and Friedrich Engels,

who declare in the *German Ideology* that the ruling ideas of any age are the ideas of the ruling class, who own the mental as well as material means of production. Feminist critics and some proponents of critical race theory, who understand public discourse as a “zero-sum” game in which more speech for some means less speech for others, take a similar position. From a critical perspective, the history of freedom of expression can be understood only as a feature of a larger history of political struggle among groups identified by race, class, and gender.

A third approach, emphasizing the historical development of the “public sphere,” mediates between liberal and critical approaches. Inspired by the work of German sociologist and philosopher Jürgen Habermas, thinkers who use the concept of the public sphere to talk about freedom of expression emphasize the importance of the development of a space of public deliberation. Like critical scholars, they point to the importance of economic development, social classes, material struggles over political power, and the material development of media forms as factors in the creation of a public sphere and the norms of public communication that govern it. Like liberal scholars, on the other hand, they point to the importance of free expression and rational deliberation within the public sphere.

Each of these approaches projects a different historical view. But any account of what we now call freedom of expression muddles the distinctions on which these approaches pivot. This is because freedom of expression is itself a constructed object. The term *freedom of expression* is a relatively recent invention. But with its construction came a kind of obligation to create a lineage for it.

Development

One might usefully begin the history of freedom of expression with the European struggles over control of information at the end of the medieval period. John Milton’s *Areopagitica* (1644), one of the first arguments in English for freedom of the press, begins with a history of censorship, which, after touching on and then dismissing incidents in the ancient and medieval worlds, argues that the true origin of censorship came with the Roman Catholic office of the Inquisition. Milton’s history

is disingenuous, of course. His rhetorical purpose was to identify censorship with an institution that his target audience would loathe; he tried to deflect attention away from the fact that all European governing institutions also constructed systems of press regulation around the same time.

The European invention of the printing press in 1450 seems to have been the cause for the invention of press regulation. Printing was immediately understood to be a technology with deep implications for the flow of ideas and information. Historian Elizabeth Eisenstein has argued that the printing press was an “agent of change” and that it altered the cultural environment by introducing “fixity,” her term for the permanence and standardization associated with printed work. Moreover, she suggests, the printing press multiplied the number of texts that any individual could conveniently encounter, and thereby produced a tremendous cross-fertilization that in turn nurtured the Renaissance and Reformation, the scientific revolution, the growth of the nation-state, and the crystallization of vernacular languages. Other scholars have challenged Eisenstein. Historian Adrian Johns, for instance, argues that rather than fixity, printing’s first effect was to multiply forgeries and piracies. According to Johns, only when a regime of copyright law stabilized the print marketplace did fixity occur.

For the history of freedom of expression, it is not the printing revolution per se that is important, but the conflict between printing and the law. Established authorities perceived printing as potentially threatening and tried to construct webs of control. The regime of copyright law that Johns cites was a strand within one such web. In England, the larger web combined elements of church, state, and the private sector. Beginning with the Tudor monarchs in the sixteenth century, and formalized in the Star Chamber decree of 1586, England controlled printing through prepublication licensing by officials operating under the Crown’s Privy Council and the Church of England. The Crown also granted a monopoly to the Stationers’ Company, the trade organization of printers and booksellers. The Stationers’ Company in turn policed its membership, taking care not to alienate the authorities. Other nations achieved a different balance of mechanisms of control, but all pursued a system of prepublication censorship.

Nevertheless, these systems of press control proved ineffective in times of strain. Printing was too mobile a technology for Europe, with its competing jurisdictions and geopolitical and religious divisions. Cultural historian Robert Darnton has documented the network of print distribution that allowed Swiss publishers to produce Enlightenment works for the French market. Earlier, printers in Amsterdam had produced English-language news-books for the public in England. Moreover, within any particular country, patrons with means could find sympathetic or ambitious printers willing to produce contraband publications.

Regulation could not prevent movements from finding expression in print. The Reformation and the seventeenth- and eighteenth-century revolutions all featured bursts of publication activity; in some cases activists in these movements made freedom of expression a cause in itself. In England, the period of revolution that began in 1640 saw the collapse virtually overnight of the complicated Tudor and Stuart system of regulation and an explosion of discordant newspapers and pamphlets. When the revolutionary Parliament moved in 1642 to create its own system of licensing, John Milton responded with *Areopagitica*, which argued against prepublication licensing, although it allowed that the state had a legitimate right to burn publications that advocated “Popery, and open superstition.” This outburst of relatively uncontrolled publication proved temporary, and after the Stuart monarchy was restored in 1660 firmer regulations were put in place. But these also eventually fell. The creation in practice of freedom of political expression often resulted from accidental political events. In England, the failure in 1695 of competing parties in Parliament to negotiate a renewal of the Printing Act produced de facto freedom of the press. The parties, however, remained suspicious of the value of free public discussion of politics, and in 1712 adopted a stamp tax that in effect doubled the price of newspapers, substituting economic regulation for content regulation.

In many western European countries, it proved difficult to silence empowered groups. New bourgeois classes appeared and asserted their rights to freedom of conscience, political participation, and, therefore, free expression. Alongside the achievement of enfranchisement, universalistic

explanations developed to legitimate these liberal policies.

Some of these explanations appealed to natural rights. Philosophers such as John Locke argued that the rights to “life, liberty, and estate” were rooted in natural law. In essence, men owned themselves, and by extension their labor and their thoughts, and had the right to do with them what they will. This naturalistic argument paralleled the religious argument that humans were endowed by nature with the capacity and the duty to make moral choices, and that governments should not interfere in the exercise of individual moral decisions.

In addition to these “metaphysical” justifications, liberals asserted that freedom of expression would also have practical effects. One recurring motif was that free discussion would lead toward progress because truth would prevail over falsehood in any fair contest. Another common assertion was that freedom of expression was necessary to maintain the vigor of beliefs in the face of a tendency toward bland conformity. This social need for lively belief also, it was argued, required toleration of unorthodox positions, especially religious ones. For the most part, early liberals presumed that there would be limits to free expression. For the most part, they presumed that non-Christians, nonwhites, women, and the poor would not participate in public discourse. They also assumed that there would be a certain etiquette to the public sphere marked by an appeal to disinterested reason.

Transformations

The public sphere, according to Habermas, came into existence in early modern Europe as the realm of private life/civil society separated itself from the state, which was in the process of transforming itself from the person and household of the monarch to a permanent bureaucratic structure. This space between civil society and the state was to work as both a steering mechanism for the state and a buffer zone protecting private rights. It could work as a steering mechanism because it allowed citizens to communicate freely on matters of common concern. It could work as a buffer zone because it kept the government under public supervision. In this liberal model of the public

sphere, any empowered individual could enter public space, but only as a “citizen.” Because a separation of civil society from the state was constitutional to the public sphere, citizens were expected to repress or “negate” their purely personal interests when entering it: they were to speak as “no one,” or as “anyone.” And they were to assume that everyone was watching. So the norms of public discourse assumed that public speech was by no one for everyone. The Federalist papers, anonymously authored by “Publius,” exemplify this style of speech. New York newspapers published their content—composed in calm, lawyerly language—with the expectation of republication throughout the nation.

One particular area in which freedom of expression was jealously guarded was legislative privilege. It was a traditional right of legislatures like the House of Commons to enjoy freedom from prosecution in their deliberations. Ironically, this right meant also freedom from public supervision, and was interpreted to prevent all but authorized publications of proceedings. The eighteenth century saw continual maneuverings to publish legislative proceedings, with legislatures attempting to muzzle news outlets in the name of freedom of expression.

The bourgeois revolutions of the eighteenth century yielded an embodied philosophy of free expression in the form of bills and declarations of rights. The United States protected religion, speech, press, assembly, and petition in the first amendment to its constitution (1791). The French Declaration of the Rights of Man (1789) includes the following protections:

No one shall be disquieted on account of his opinions, including his religious views, provided their manifestation does not disturb the public order established by law.

The free communication of ideas and opinions is one of the most precious of the rights of man. Every citizen may, accordingly, speak, write, and print with freedom, but shall be responsible for such abuses of this freedom as shall be defined by law.

Such catalogs typically asserted that these rights were natural or divinely ordained. But the logic of the Enlightenment also included an

impulse toward empiricism that worked to undermine the notion of natural rights. Arguing that the book of nature could be understood without the assistance of divine revelation, the scientific revolution that accompanied the political revolutions in the Western world called into question all notions of divine order.

Utilitarian Notions and Tyranny of the Majority

If rights could not be justified by an appeal to the natural order, then the appropriate response called for an emphasis on utilitarian notions of the grounding of rights. In England, philosophers James Mill and his son John Stuart Mill articulated such notions, arguing that acknowledging a right to free expression had the practical effect of promoting the discovery of new truths and prolonging the liveliness of existing truths, resulting in a more dynamic social order and a more equitable political order. But utilitarian justifications could always be falsified by experience. One could argue that a panoptic society was more functional than a libertarian one. Likewise, in utilitarian or consequentialist notions of free expression, there would always be a question of balance. Free expression would be just one among a host of other goods, like the right to privacy or property rights.

A utilitarian justification of free expression was falsifiable by practice. In the wake of the eighteenth-century establishment of freedom of expression, as well as other individual rights of private security and political participation, a series of observers described shortcomings in the practice of free democratic societies. The most famous of these observations are Alexis de Tocqueville’s *Democracy in America* and John Stuart Mill’s *On Liberty*. De Tocqueville noted that freedom of the press had produced explosive growth in the number of newspapers in the United States, but that this had resulted in a general lowering of the quality of journalism. Any individual newspaper or journalist had little authority, but cumulatively the press was very powerful indeed. Its power was the power of democracy, a system in which a raw majority of the people could exercise power in every realm of social, cultural, and political life. Mill echoed de Tocqueville’s alarm over the

potential “tyranny of the majority.” Repeating his father James Mill’s arguments about the importance of free expression for the continual progress toward truth in a dynamic society, Mill pointed out that a “tyranny of custom” had appeared in Victorian England, and that this threatened the independence of the strong individuals on the creative periphery of the society necessary to drive continued development.

The rights talk of the bourgeois revolutions had been majoritarian. The point of protecting free expression was to allow the majority to deliberate, to form public opinion, and to assert it in the face of constituted authority. Constitutional law professor Akhil Reed Amar has convincingly argued that the U.S. Bill of Rights (1791) was a majoritarian document. This alarmed de Tocqueville and Mill. Though neither proposed restricting freedom of expression, their critiques implied that there should be policies aimed at countering majority impulses.

By the end of the nineteenth century, the industrial west had developed a minoritarian agenda for freedom of expression. Movements and groups outside the mainstream used the notion of freedom of expression as a political tool to protect core beliefs, practices, or identities from majority pressure. Sometimes these actors concentrated on concerns that might be considered private—sex and religion were frequent flashpoints. Sometimes the stakes were political or cultural. In many cases in Britain and the United States, the key issue was class power. In Britain, property restrictions on voting and the stamp tax on publications gave a class edge to questions of equal rights. In the United States, attempts to limit the labor movement’s exercise of free expression defined the issue at century’s turn. Arguably, these outsider groups invented the twentieth-century notion of freedom of expression. At the same time, some of these struggles generated anti-liberal notions of free expression.

In the United States, the World War I era marked a climax in the development of thinking about freedom of expression. In the background were fears about the tyranny of the majority—always also a fear of domination by the lower classes—intensified by new, more sensual media, especially motion pictures and recorded music, which seemed to undermine cultural authority by

directly entering the eyes and ears of morally, culturally, and socially vulnerable populations—women, children, exhausted workers. Against this background appeared all the abuses of political communication associated with a new age of total war—propaganda in every form, and official and informal repression of dissidents. In the wake of World War I, a civil liberties coalition emerged, consisting of lawyers, academics, librarians, artists, and journalists. This coalition aimed to protect individual expression. At the same time, the experience of the propaganda effort and the failure of the news media to counter it produced a new sense of apprehension about the power of the media. Thinkers such as journalist and political commentator Walter Lippmann called for some institutional corrective for commercial media—in Lippmann’s case, expert intelligence bureaus that would provide authoritative information to decision makers.

Libertarian and Public Service Models

These quite different legacies of World War I inspired two very different liberal traditions of addressing the problem of free expression. The civil liberties movement inspired a libertarian approach. Emphasizing the protection of individual freedom from government interference, this approach predicted that allowing the broadest exploitation of free expression to every conceivable actor, including both nonmainstream voices and the emerging corporate media industries, would produce a healthy and diverse realm of public discourse.

But the suspicion of the power of the media produced a very different approach. If media were becoming larger, more monopolistic, and more powerful, as the new terms *mass media* and *mass communications* suggested, then competition in the marketplace could no longer be counted upon to provide a healthy realm of public discourse. Instead, media outlets had to be tasked with the responsibility to provide a virtual marketplace, or *marketplace of ideas*, also a novel term in the middle third of the twentieth century. This approach to free expression viewed individual freedom as requiring media stewardship, and amounted to a public service or social democratic vision of media freedom.

The public service model of free expression seemed in the ascendant at the end of World War II. In the United States, practical moves like the breakup of the Hollywood studio system in the late 1940s and publication of the FCC's 1946 "Blue Book" setting standards for broadcast licensees gave concrete form to the abstract articulation of "social responsibility theory." The idea was perhaps most clearly articulated by the Hutchins Commission, whose 1947 report, *A Free and Responsible Press*, is credited with crystallizing this approach. Internationally, similar developments in European countries, which had already instituted a public service regime for telecommunications and were more advanced in developing media professionalism, suggested ways of fulfilling the "right to communicate" set forth in the United Nations' Universal Declaration of Human Rights (1948).

The UN Declaration's wording was designed to embrace more than these two liberal traditions, however. It also suggested a different approach to free expression coming from the Marxist tradition. Marxism rejected the assertion in liberalism that the realm of ideas operates by different rules than the material realm. In the material realm, goods are distributed in roughly a zero-sum fashion—more oil or gold for you is less for me. Liberals asserted that more speech is good for everyone, and that the solution to any equity problem in communication is simply more speech. Marxists pointed out that liberalism's notion of protecting freedom from government interference translated into a preservation of inequality in the private realm—more speech for the rich is less speech for the poor. So Marxists called for a redistribution of communicative resources.

Such a redistribution, while elegant in theory, was difficult to implement. In nations governed by Marxist authorities, like the Soviet Union and the People's Republic of China, Marxist theory translated into a combination of party control of media systems coupled with a kind of professionalization of media work with the agenda of creating a realm of correct political discourse. By the 1930s in the Soviet Union and by the 1960s in the People's Republic of China, apparently seamless systems of state-controlled media operation were in operation. These systems were supposed to be transitional, pending maturation of communist society. Few

Marxists claim these systems to be appropriate embodiments of Marxist principles, which would require a less alienated body of media workers and a more responsive, less centrally controlled, and more open news and media culture. Into the twenty-first century, no mature Marxist national media system offered itself as a paradigm.

Global Free Expression, the MacBride Commission, and Right to Recognition

By the second half of the twentieth century, however, the language of freedom of expression, like the language of democratic governance, had become the default language of the international community. As the Universal Declaration attests, a global consensus endorsed something called free expression, even though many different conceptualizations of it existed. The tension between these conceptualizations played out in the 1970s and 1980s in the United Nations Educational, Scientific, and Cultural Organization, or UNESCO.

Calls for a "New World Information and Communication Order" led UNESCO to create a commission, headed by Sean MacBride. Formally called the International Commission for the Study of Communication Problems (and informally the MacBride Commission), it issued its report, *Many Voices, One World*, in 1980. The report acknowledged a series of imbalances in communication that paralleled imbalances in wealth, with the north controlling international wire services, international markets in film and broadcast entertainment, and consequently the flow of images and information. The report responded to the principle of the free flow of information with a plea for a "free and balanced" flow and suggested a variety of principles and mechanisms to promote it. Critics, usually speaking from liberal principles, seizing on the human rights records of some proponents and on the commission's recommendations for licensing newswriters and for "right of reply," depicted the movement as a concealed attempt at endorsing censorship. The controversy contributed to the withdrawal from UNESCO of both the United States and Great Britain. In the decade that followed, the debate over the international communication and information order shifted from UNESCO to the World Trade Organization as

protecting intellectual property became the key site of struggle.

A continual erosion of the public service model in Western countries accompanied this shift. In the 1980s and 1990s, national telecommunications authorities went through a process of dismantlement or privatization, or privately owned commercial broadcasting and cable or satellite television and radio subsidized them. The collapse of the Soviet bloc after 1989 opened a new territory to commercial media development. In some countries, media entrepreneurs acquired tremendous political influence. The rise to political power of media magnate Silvio Berlusconi in Italy marked the emergence of a new kind of “media politics.”

The MacBride Commission report and the controversy it incited showed the difficulty liberalism as an ideology experiences when the subject of free expression is shifted from the individual to the community. In the MacBride Commission, which took its initial charge from the Universal Declaration, reference was made to the “right to *communicate*.” Liberals note that this is different from the right to free *expression*. Expression does not require that anyone else pay attention, and is in fact freest when no one does. Communication, on the other hand, only exists with some reciprocal action. So a right to communicate entails the imposition of a duty to be communicated with.

Within liberal societies, the parallel frontier involves the right to recognition. Nonmainstream and subaltern groups claim a right to recognition of their identity and culture by the public or the national government, arguing that otherwise their members are denied full equality under the law. Liberals are unaccustomed to thinking of groups as rights-bearing, however. Corporations, for instance, are rights-bearing only because liberalism treats them legally as “fictitious persons”—General Motors has the same First Amendment rights as any citizen. It makes no sense to think of the Quebecois as a fictitious person, however. So on what basis can liberalism require the acknowledgment of Quebec or Canadian francophone culture?

This dilemma has been keenly felt in multicultural nations, particularly those with competing

religious communities. The reception of Salman Rushdie’s 1988 novel *The Satanic Verses* in India and the Muslim world was one such spectacular case. In 2006, the Danish newspaper *Jyllands-Posten* published caricatures of the Prophet Mohammed that were condemned by Muslims as blasphemous and rioting followed in numerous countries. In both cases, Muslims claimed a kind of right to recognition; liberals responded by claiming the issue to be the individual right to free expression.

Such controversies became framed by the larger question of freedom and policing in the post-9/11 age of the Global War on Terror. Although the implications have been most visible in the realms of surveillance and procedural rights, the GWOT has also marked the return of the World War I dynamic, as propaganda has been matched by formal and informal attempts to oversee and curtail certain forms of expression, especially in combat zones. In the United States, “embedding” reporters, covertly funding “expert” sources for cable news shows, planting news in Iraqi media, restricting use of cell phones and blogs by military personnel, wiretapping electronic communication, and surveilling antiwar protesters have awakened traditional civil liberties concerns.

So the beginning of the twentieth century saw conflicting trends in the realm of free expression. On the one hand, the reappearance of patterns of state control and interference looks back to earlier generations of struggle and reenergizes older civil liberties organizations. On the other, technological change and neo-liberalization promise a new era of channel abundance that makes older forms of control, including journalistic professionalization, seem superfluous.

FREE FLOW OF INFORMATION

The idea of a “free flow of information” tends to elicit highly positive connotations, alluding to a world in which all forms of human expression may be transmitted or exchanged without interference from government or private interests for the benefit of humanity. In this respect, it is similar to the sister concept of “free trade.” In both cases, the “purr” qualifier “free” dangerously invites immediate endorsement. The history of the concept from the mid-20th century onward, as the following outline will demonstrate, nonetheless

pits this benign formulation against a number of sometimes less benign or simply rival values, interests, and concerns. These largely arise from a critical consideration of *whose* freedom is being addressed, to communicate *what*, precisely, under *which* conditions? Such considerations invoke concerns about reciprocity, morality, equality, and corresponding public interest regulation. This entry examines the history of the free flow of information, its implications, and use as an ideological tool.

History of Free Flow of Information

While the expression “free flow of information” existed prior to World War II (1939–1945), it was toward the end of that conflict and in the immediately ensuing years that the expression, or the ideas that it encapsulates, came to be embedded in texts of national and international significance. Important examples include (as “free flow of ideas by word and image”) the constitution of the United Nations Education, Scientific and Cultural Organization (1945), and (as “freedom of opinion and expression”) the United Nations Declaration of Human Rights (1948). The United Nations Economic and Social Council (ECOSOC) established the Subcommittee on Freedom of Information and of the Press in the early 1950s. This body addressed the problem of a global imbalance of information structure as early as 1961, as did the United Nations General Assembly in its deliberations in both 1952 and again in 1962.

The intellectual currency of “free flow” has demonstrated durability and adaptability over time, appearing (as “freedom to seek, receive and impart information and ideas of all kinds, regardless of frontiers, either orally, in writing or in print, in the form of art, or through any other media”) in the United Nations’ International Covenant on Civil and Political Rights (1966), and in the 1972 General Conference of UNESCO’s Declaration of Guiding Principles on the Use of Satellite Broadcasting for the Free Flow of Information, the Spread of Education and Greater Cultural Exchange.

Not long after the end of World War II, it came to be widely appreciated that the principle of “free flow of information” might potentially clash

with both the principle of equity between nations in their levels of technological and economic development and with the principle of *national sovereignty*, which can be said to encompass a nation's right to control what is imported into and exported across its national boundaries, even in such spheres as information, science, and expression over which the nation may be said to have some form of ownership interest. In this sense, the transnational delivery of television signals by satellite in the 1960s was widely expected to pose a severe threat to national cultural sovereignty even if, by the 1990s, it seemed that satellite had come to have greater significance at local, national, and regional than at global levels. The critique of "free flow" dovetailed with discourses of media imperialism, which essentially argued that the information environments of developing nations, many of them ex-colonies, were dominated by the former (and continuing) imperial powers, their geopolitical and media corporate interests, content, advertising (much of it for the produce of Western multinationals), and Western technologies.

The "free flow" principle was transmuted accordingly to the principle of a "free and *balanced* flow of information" in the 1978 UNESCO Declaration of Fundamental Principles Concerning the Contribution of the Mass Media to Strengthening Peace and International Understanding, the Promotion of Human Rights and to Countering Racism, Apartheid and Incitement to War. This document called for "greater reciprocity" of information, and for a "free flow and better-balanced dissemination of information"—reformulations that were reiterated in the McBride Commission report to UNESCO in 1980. The McBride report was the culmination of a series of debates at conferences hosted principally by UNESCO and by member countries of the Non-Aligned Movement, that discussed a proposed "New World Information and Communication Order" (NWICO), as a necessary sequel to an earlier proposal for a New World Economic Order (NWEO). The story of the NWICO debates and their conflicting philosophical foundations (including Western libertarianism, communism, and the ideology of national development) has been recounted in many sources, including Achal Mehra's 1986 book, *The Free Flow of Information: A New Paradigm*.

The spirit of NWICO had a positive impact in international telephony governance in 1973, when the International Telecommunications Union (ITU) eliminated its earlier, colonial system of voting whereby nations had voted according to the number of colonies they administered, and again in 1982, when the ITU altered its mandate to address the "special needs of the developing countries" (Winseck, 1997). Yet NWICO and the 1980 McBride Commission report met with sustained Western media attack, spearheaded by the United States and Britain (through such venues as the "Voices of Freedom Conference" in 1981 and, in 1982, U.S. Congressional measures against UNESCO, and in the lobbying of the World Press Freedom Committee). Their reaction was articulated in terms of a concern that UNESCO might endorse restrictions on "free flow" imposed by undemocratic governments. It was argued that these might require the licensing of journalists (although UNESCO itself never supported this concept). Western negative reaction should also be pondered in the context of an evolving postcolonial world in which the United Nations was no longer so pliable a tool for the promotion of Western foreign policy as it had been in its earliest days.

The United States (in 1985) and the United Kingdom (in 1986) withdrew membership and financial support from UNESCO, action that appeared to prompt conciliatory changes in UNESCO structure and policy. The United States and the United Kingdom returned to UNESCO two decades later in 2002. UNESCO had ceased to aggressively promote the ideas of the McBride Commission. Through its International Program for the Development of Communication (IPDC), UNESCO now concentrated on technical assistance, often in bilateral contexts. The discourse of "free flow" lost popularity for some years following McBride. McBride had exposed it as an ideological tool wielded mainly by the United States and its allies. Those responsible for such exposure were now roundly condemned by Western governments and mainstream media.

Inspired by the work of Manuel Castells and his disciples, some academics later abandoned metaphors of "flow." They proffered the alternative of "network" and similar concepts that promised a stronger purchase on, or visualization of the

complex interrelationships between communication, space, and time in a digital age. With the ascent of broader discourses of globalization, ideas of media imperialism faded from view, under attack for its alleged disregard, among other things, of the complexity of culture and the framing of media issues in terms of national interest (as opposed to class, race, ethnic, and other sources of cultural identity). These complaints drew the critical response of those who argued that ideologies of globalization simply camouflaged a resurgent neoliberalism that served to benefit, primarily, the imperial powers in a context of continuing competition and hostile propaganda directed by the West toward the newly capitalist powers of Russia and China, and they wondered whether the newer language subtly distracted attention from the continuing role of unequal communications power, gatekeeping, and control.

UNESCO, on the other hand, had found it useful, in the digital context, to revive the language of “flow.” “Promoting the free flow of information and the development of communication” appeared as a component of UNESCO’s Medium Term Strategy for 1996–2001, adopted at its General Conference in 1995. The report of the UN World Summit on the Information Society (WSIS) in Tunis, 2005, whose 170 governments recognized “that freedom of expression and the free flow of information, ideas, and knowledge are essential for the Information Society and beneficial to development,” was a very different text to that of the McBride report a quarter of a century earlier. WSIS had a strong government, corporate, technocratic character, focusing principally on computing, the new media and the Internet, and its patrons worked hard, not altogether successfully, to bracket off ideological and political controversy. UNESCO’s embrace of neoliberal frameworks, notwithstanding, the United States withdrew funding from UNESCO in 2011 and under President Donald Trump departed from it a second time in October 2017, alleging ideological bias (against Israel among other things) and mismanagement. The United Kingdom and Israel also announced plans to leave in 2018.

Benign Implications

In the earliest uses of “free flow of information,” the term had broadly benign signification. Later

attacks on the concept have generally targeted particular uses to which the expression is put, rather than the inherent ideals that it is intended to represent. The word *flow* is associated with fluidity, whether of water or of electricity, and the notion of a “free flow” of information is suggestive of a forceful, self-sustaining, and unrestrained movement of ideas. The limits of this positive interpretation of the metaphor, however, are suggested by the unidirectional character of flows of both fluid and of electricity and these in turn are pointers to those sources of criticism that maintain that the term is ideologically loaded.

The specific reference to “information” is sometimes deemed an unsatisfactory semantic vehicle for the full range of human communicative or expressive activity, seemingly confining the notion’s scope of reference to formal knowledge of a somewhat descriptive or scientifically uncontested character. Nonetheless, the term has acquired value as shorthand for the uncontrolled movement of information, ideas, creative expression within and, especially, *between* societies. It acquired considerable purchase during the 20th century, especially in those societies that had acquired democratic forms of government (in which processes of decision-making were said, unrealistically, to be founded solely on the interchange of rational argument among different interests and groups), and in which important ideas and information were nurtured and widely articulated by well-developed networks of communications media. A close symbiosis between democracy and media has often been postulated. The historical context of the Second World War and its immediate aftermath were especially receptive to the idea of “free flow of information,” as Western Europe and the United States recovered from the threats of fascist authoritarianism that had been posed by the Axis powers, threats that many believed to have been revived in a different guise by Soviet communism under the leadership of Joseph Stalin. Western powers represented an equivalent threat in their disingenuous disregard for the fact that “free flow” in a context of deep inequalities between nations would privilege the market advantages that accrued to Western producers and the interests of their respective nations.

Tool of Ideology

The deconstruction of what he called the *free flow* doctrine was perhaps most eloquently undertaken by Herbert Schiller, professor at the University of California, San Diego, in his 1976 book *Communication and Cultural Domination*, as well as in other of Schiller's writings. His second chapter of the 1976 book, drawing in part from an article he previously published for the *Journal of Communication* in 1974, was titled *The Diplomacy of Cultural Domination and the Free Flow of Information*. In this chapter, he recounted the intensive diplomatic efforts by the United States, in partnership with influential U.S. publishers, associations, and news agencies such as the Associated Press, to promote the "free flow" concept. Achal Mehra, in his 1986 book, referred to House and Senate resolutions in 1944 that called for "world-wide right of interchange of news . . . without discrimination . . . protected by international compact." Schiller (1976) referenced a 1944 resolution of directors of the American Society of Newspaper Editors in support of "world freedom of information and unrestricted communications for news throughout the world" (p. 31), a sentiment that had the support of spokespersons from both the major political parties and from Congress. The doctrine was espoused by the Inter-American conference on problems of War and Peace convened in Mexico City in 1945 and embedded in the earliest drafts of the constitution and organizational structure of UNESCO, not to mention during the outset of the United Nations itself, including the foundation of the United Nations Commission on Human Rights in 1946. In 1948, there was a United Nations Conference on Freedom of Information.

Writing in 1997 for the *Le Monde Diplomatique*, Schiller recalled U.S. Secretary of State John Foster Dulles as saying that "free flow" was the most important issue in foreign policy. In 1946, Assistant Secretary of State William Benton had said much the same thing: "Freedom of the press—and freedom of exchange of information generally—is an integral part of our foreign policy." In his article, Schiller referred to U.S. delegates in the contexts of the United Nations and UNESCO pressing "relentlessly" for the free flow of information. Financial incentives were later added to ideological exhortation. The Marshall

Plan, for example, tied dollar grants to a recipient's acquiescence to opening its market to U.S. cultural exports and film. Schiller referred to the "enormous significance" of U.S. state-funded research and development for such things as computer and surveillance technologies. The development of satellite was promoted, he argued, to purposefully "wrest global information control from Great Britain which at that time exercised worldwide domination of underseas cable."

In his 1976 book, Schiller linked these developments to the experiences of the United States in the period immediately preceding the Second World War, and in particular to the many decades during which the leading news agency of the United States, Associated Press, was subservient to the global leadership by British-based news agency, Reuters, of a news agency cartel. An influential polemic, *Barriers Down*, written by Associated Press managing director Kent Cooper in 1942, described Cooper's campaign over many years to liberate Associated Press from the influence of the cartel, which Associated Press had largely succeeded in doing by 1933. The book was an influential source for "free flow" enthusiasts. It chronicled how the United States was disadvantaged by the cartel restrictions that limited Associated Press's scope for independent news coverage, subjecting American readers to biased news of the world written through the lenses of journalists based in other countries, and subjecting foreign readers to biased news of the United States that had not been written by U.S. journalists.

The significance of Schiller's attack on the free flow doctrine, therefore, was that it revealed the extent to which use of the term had been put to ideological work on behalf of national and industrial interests, in particular, the interest of the United States in taking over from Britain the role of world superpower, and the interest of U.S. publishers, movie makers and broadcasters in securing unfettered access to global markets at the very time when many nations, such as those emerging from war-devastated Europe might, if left to themselves, have much preferred measures of market protection on behalf of nascent or recovering local industries. Yet, as Dwayne Winseck has noted, the "free flow of information" doctrine had wiped out the rights of states as participants in dialogue about important areas of communications policy.

Skepticism of what Schiller labeled the “free flow doctrine” was reinforced by the 1970s series of UNESCO-sponsored conferences that constituted the NWICO debates. Schiller’s deconstruction of the term exercised a powerful influence on many of those whose work contributed to the culmination of those debates, the UNESCO-commissioned McBride report, named after its chair, Sean McBride, and published in 1980.

At the start of this round, there was a development in Helsinki that struck a discordant tone, dislodging political discourse, at least temporarily, from uncritical acceptance of the rhetoric of “free flow.” Accounts have been offered by both Schiller in his 1976 volume and, in 1995, by Kaarle Nordenstreng, a Finnish communication scholar who participated in the 1975 Conference on Security and Co-Operation in Europe, known also as the *Helsinki Accords*. This brought together the Heads of State of 33 European nations, the United States (represented by U.S. president Gerald Ford), the Soviet Union (represented by Soviet president Leonid Brezhnev), and Canada. The states signed a document that called for increased international cooperation in practically all fields, including culture and communication. In his address to the conference, the President of the Republic of Finland, Urho Kekkonen, critiqued the concepts of “freedom of speech” and “free flow of information,” arguing that these were not unalloyed benefits in circumstances of severe inequality of access to the means of communication. Could it be, he wondered “that the prophets who preach unhindered communication are not concerned with equality between nations, but are on the side of the stronger and wealthier?” (quoted by Nordenstreng, 1995).

Resuscitation of the Concept

Signification of the term *free flow*, therefore, is an ambivalent one. In use, it has often elided over the issue *whose* freedom? Freedom of media proprietors, or of media consumers; of senders or receivers? Is there reciprocity of communication between parties to the communication? Ambivalence cloaks the play of *power* in situations in which some parties to communication are much better resourced than others in capital, equipment, know-how, technology, and talent. Where there are wide

discrepancies of power, reciprocity between the parties to any communication is much less likely. In addition, the term *information* seems to many critics of “free flow” doctrine much too narrow a concept for a phenomenon that embraces a vast array of publishing, educational, entertainment and cultural products, and activities that are disseminated in complex ways. Such a restriction may mostly serve the interests of those who stand to gain by the reduction and commodification of this vast array into marketable bytes. In its use, finally, the term often seems to assume that the primary enemies of “free flow” are governments, whereas increasingly the enemies of “free flow” are found to be private enterprises of both legacy and digital media, often in the service of government-originated propaganda conflicts whose purpose is to stymie absolute “free flow.”

Initiatives to stimulate privatization of previously government-owned or controlled media form a part of the bundle of trends that accompany policies of media “deregulation.” Their impact is to enhance the likelihood that private interests may reduce “free flow” through the political economy of “infotainment,” or the dominance of information flows by plutocratic, for-profit corporate agendas. This happens principally through the political power that is accumulated by the giant communications conglomerates. Their emergence was facilitated by the collusion of Western political and corporate interests in adoption of neoliberal principles of “free trade,” globalization and deregulation of capital under U.S. hegemony and military supremacy (accounting for a trillion dollars a year expenditure by 2018), becoming increasingly assertive in the wake of the so-called war on terror from 2001 onward.

These problems notwithstanding, the term *free flow* also possesses great rhetorical durability, as in the case of United Nations discourse of the World Information Society. In 1997, Winseck argued that the term had been resuscitated through the “trade in services” regimes of the North Atlantic Free Trade Area (NAFTA), the World Trade Organization (WTO) and their push toward the inclusion of media deregulation as a condition for membership of the emerging global economic order. Features of media deregulation as advanced by the United States and Great Britain—such as removal of regulations that had previously

restricted such things as foreign investment in domestic communications infrastructures and services, cross-ownership between newspapers and broadcasters, or the share of national audience that single broadcasters might reach—also promote the corporatization of media and reduce the potential for public participation in access to media and to decisions about media content. “Free flow of information” ideology, applied to such trends, cloaks the implications for a continuing colonization of communications space under the rhetorical fuzziness of the supreme “purr” word freedom.

An example of rhetorical durability was the proposal by U.S. Attorney Chuck Rosenberg (2005) and others for a freedom of information act: as a measure to delimit the circumstances and manner in which members of the media might be compelled to reveal sources in court. While out of line with uses of the term in the international realm, this instance begs the question, once again, of *whose* freedom—the freedom of courts to subpoena media as witnesses, or freedom of the media to protect sources in the interests of gathering information? We might conclude, therefore, that despite its demonstrated lack of intellectual precision, the term *free flow of information* exercises continued traction as a rhetorical tool in debates about the proper role of communications media.

Profound threats to the concept, however, surfaced following the election of U.S. President Donald Trump in 2016 and his invocation of the term *fake news* in protest against mainstream media coverage of his campaign even as he himself resorted to Twitter to propagate what his critics derided as further “fake news.” Accusations of collusion between the Trump campaign and Russia through covert Russian Internet propaganda and allegations of Russian hacking of Democratic Party campaign computers were supported by an official investigation chaired by Robert Mueller in 2019, but remained deeply contentious. Ensuing debate opened a hornet’s nest of anxiety about the supposed contamination of the public sphere by malign actors, with the witting or unwitting assistance of the new digital “platform imperialists” (such as Apple, Facebook, Google, Twitter, and Microsoft), and who exploited the Internet and social media for nefarious political and corporate

propaganda through nontransparent, often deceptive, means of microtargeting, the sale of “big data,” “bots,” “trolls,” and untold hordes of paid “influencers.” Exposure of the role of Cambridge Analytica in harnessing Facebook accounts (and their “friends”) to influence elections through micro-targeting merely revealed the tip of an iceberg of massive corporate and political gaming of the Internet, dwarfing the significance of any one player such as Russia or its Internet Research Agency. Technology-enabled “free flow” appeared to have subverted public confidence in the validity and reliability of media and communication systems as vehicles for the dissemination of truth. The result was a clamor for measures that might (but probably would not) bring the digital age to heel through government, industry, and technology regulation.

FREE PRESS AND FAIR TRIAL

The phrase “free press and fair trial” refers to a decades-long debate between the American press and the legal profession about balancing two rights guaranteed by the Constitution. One is the First Amendment right of the press to freely provide the public with the information necessary for a functioning democracy. The other is the Sixth Amendment right of the public to fair trial by unbiased peers. Both are fundamental rights, the importance of which, as they stand alone, has been acknowledged by both sides. The press and the legal profession, however, have at times been at odds with each other when the two rights clashed during the media coverage of criminal cases, especially high-profile ones.

Members of the legal profession have argued that in high-profile cases heightened media attention with speculative and sensationalized coverage makes a fair trial impossible, while the press has insisted that the comprehensive and transparent coverage of the judicial process open for public scrutiny is necessary to make sure justice is delivered. Both sides have held numerous discussions, organized committees, and delivered opinions and recommendations on the issue. This entry discusses cases that have raised debate over the balance of the rights to a free press and a fair trial in the United States and measures taken to address this debate.

Case History of the Free Press and Fair Trial Debate

The rapid advancement of communication technologies that revolutionized information dissemination

and enhanced the ability of the news media to inform the public generated a set of issues that, according to the American Bar Association, infringed on the right to fair trial. This section discusses several cases that have been used as examples of this problem.

The State of New Jersey v. Bruno Richard Hauptmann (1935)

Hundreds of journalists and thousands of spectators descended on Flemington, New Jersey, with a population of around 3,000 at the time, for the trial in what has been referred to as the Lindbergh baby kidnapping case. In 1932, the son of aviators Charles Lindbergh and Anne Morrow Lindbergh was abducted and later found dead. Two years later, a German immigrant, Bruno Richard Hauptmann, was arrested and charged in the crime. The press flooded the courtroom and, even though Judge Thomas Trenchard had banned typewriters and photography during the trial, managed to take photos. Journalists also recorded newsreel and transmitted the trial reports through teletype machines and snuck-in portable radio transmitters.

During the trial, the press had free access to both the prosecution and the defense, victims, relatives, and family friends, feeding the global interest amplified by the Lindberghs' celebrity status. Hauptmann was convicted of murder and later executed. Even though it is impossible to tell whether the coverage had any prejudicial effect on the jury, the trial was consistently disrupted by the press. Photography and cameras in all federal and many state courts were later banned.

Irvin v. Dowd (1961) and Rideau v. Louisiana (1963)

The U.S. Supreme Court in separate cases used the prejudicial publicity argument to reverse the convictions of two men, Leslie Irvin and Wilbert Rideau. In Irvin's case, law enforcement officials issued press releases saying that Irvin had confessed to six murders and newspapers, radio stations, and TV stations extensively covered Irvin's criminal background along with the charges against him. The Court concluded that the pretrial prejudice created by the media rendered a fair trial

impossible. In Rideau's case, the Court relied on its ruling in *Irvin* to determine that the environment created as the result of three broadcasts by the local television station of Rideau's interrogation and confession was so hostile that there could be no fair trial.

Sheppard v. Maxwell (1966)

The social prominence and the family legacy of Samuel Sheppard, a neurosurgeon from Bay Village, Ohio, paired with the exceptional gruesomeness of his pregnant wife's 1954 murder, thrust him into the center of press attention as the investigation of the crime, Sheppard's arrest, and his trial were unfolding. Local newspapers not only reported on the case but also ran editorials pointing to inconsistencies in Sheppard's account of the events and suspicious details and questioning Sheppard's character as well as the impartiality of the local police and their ability to handle the investigation. Newspaper editorials insisted on the involvement of Cleveland police and demanded Sheppard's arrest.

As in the Lindbergh case, the press had access to everyone involved as well as all the crime scene. Albert B. Lawrence in his 2018 article "A Murder that Mattered: Sam Sheppard, the Supreme Court, and Free Press/Fair Trial" recalls that after 2 weeks of selection and dismissal, only one juror in Sheppard's trial said he had not heard about the case. In 1966, the U.S. Supreme Court struck down the murder conviction on the grounds of prejudicial publicity, sending the case back to the district court. In a retrial later that year, Sheppard was found not guilty.

Kennedy Assassination and Lee Harvey Oswald (1963)

The assassination of President John F. Kennedy and the subsequent arrest and assassination of Lee Harvey Oswald became the center of media attention worldwide. The cameras were rolling when Jack Ruby shot Oswald during his transfer to the county jail.

Such high-profile crimes within days of each other in the era of television amid shock, grief, efforts to regroup, investigate, and inform the public of the developments resulted in chaos

and news reports riddled with errors and speculation. A 1964 report on the assassination from a presidential commission chaired by Chief Justice Earl Warren, commonly known as the *Warren Commission*, concluded that it would have been impossible for Oswald to have a fair trial because of the public prejudice triggered by the news.

The commission established that the police allowed the press free access to the areas where Oswald was moved from his cell to the interrogation room and from his cell to the transfer car, that the media were free to question Oswald on his way back and forth, and that the police shared the details of the investigation with the press. The report also put forward recommendations for the bar, police, and the media to jointly develop a set of ethical standards to guide the flow of information during criminal investigations and trials and ensure that the people's right to a fair trial is not violated.

People v. Boss (1999) and Amadou Diallo/NYPD Trial (2000)

Four plainclothes members of the New York Police Department's Street Crime Unit patrolling a Bronx neighborhood saw a suspiciously behaving man and decided to stop him under the state's stop-and-frisk law, which allowed police to detain and question people without making an arrest under certain circumstances. The stop ended in the fatal shooting of an unarmed 22-year-old immigrant from Guinea in the vestibule of the apartment building where he lived. Amadou Diallo was shot 41 times. Nineteen shots reached their target.

After the shooting, civil rights leader the Rev. Al Sharpton emotionally charged, highly publicized protests, some of which included Diallo's grieving mother. The protests also drew well-known New Yorkers such as the former mayor David Dinkins and actor Susan Sarandon. Both were arrested but later released. Sharpton, by his own account, wanted to attract as much media attention as possible to make the authorities pay attention to activists' concerns. An appellate court panel moved the officers' trial to Albany, New York, arguing that it would be impossible for the officers to receive a fair trial in New York City due to

the protests and heavy news coverage. All four officers were found not guilty of all charges.

Boston Marathon Bomber (2013)

Three people were killed and over 260 were injured when bombs went off at the finish line of the 2013 Boston Marathon. The brothers accused of planting the bombs, Tamerlan and Dzhokhar Tsarnaev, were located by the police several days later. Tamerlan, the older brother and the alleged mastermind behind the bombing, was killed in a shootout with police, while the younger, Dzhokhar, was arrested and went on trial.

In 2014–2015, Tsarnaev's defense team filed multiple petitions and motions to move his trial to a different location, arguing that the pretrial publicity was so widespread and the prejudice against Tsarnaev was so strong with so many people affected by the bombings and the subsequent lockdown during the manhunt, that he would not be able to have an impartial jury in Boston. All the petitions and motions were denied based on the logic that exposure to media coverage does not necessarily result in prejudice. The presiding judge screened the jurors, and Tsarnaev went on trial. He was found guilty on 30 federal counts and was sentenced to death.

In 2019, Tsarnaev's team took the case to the First Circuit Court of Appeals to try and lift his death sentence, arguing that he did not get a fair trial in 2015 because the jury was biased by the effects of the bombings and the relentless media coverage. According to the appeal, the jury screening process was flawed; two jurors had failed to disclose during the jury selection process that they had posted or exchanged messages on social media about Tsarnaev or jury selection. In 2020, the appeals court threw out Tsarnaev's death sentence, citing insufficient attention paid to potential juror bias, and ordered a new penalty-phase trial. Later that year, the U.S. Justice Department appealed the appeals court ruling to the U.S. Supreme Court.

Addressing Free Press and Fair Trial Debate

An array of measures taken during the 1960s after the Warren Commission report aimed to limit

what information the police and the attorneys could share with the news media. Examples included a ruling by the State Supreme Court of New Jersey that prevented prosecutors and defense lawyers from talking to the media about confessions, criminal records, or deliberations about a defendant's guilt or innocence. In addition, a committee convened by the American Bar Association investigated how news organizations covered courtroom proceedings in order to develop principles governing conduct for attorneys and limit potential infringement to a defendant's rights to a fair trial. The Advisory Committee on Fair Trial and Free Press was one of six committees that were part of the Special Committee on Minimum Standards for the Administration of Criminal Justice chaired by Justice Paul C. Reardon. The standards issued by the committee in 1968 included recommendations for lawyers and police officials to restrict comment on pending criminal cases. Media groups have taken their own measures to address the issue, including the development of internal ethical standards by a number of media organizations.

More recent arguments over the right balance of free press and fair trial have focused on whether pretrial publicity, especially in high profile cases, can be tied to any locale, considering the reach of the cable and online media, including social networks. In *Skilling v. United States* (2010), the Supreme Court established that only extreme circumstances warrant the assumption of prejudice. Mere knowledge of a case or exposure to media coverage does not necessarily mean individuals cannot make unbiased conclusions based on evidence. Work continues to find a balance between the two fundamental rights guaranteed by the Constitution.

FREEDOM OF INFORMATION ACT (FOIA)

The Freedom of Information Act (FOIA) is an information disclosure statute that provides the principal means of access to records of the executive branch of the United States federal government. The FOIA, codified at 5 U.S.C. section 552, was enacted in 1966 and has been amended since, significantly by the Electronic FOIA Amendments of 1996 and the OPEN Government Act of 2007. This entry discusses the history of the FOIA, its use today by journalists and others, variations in its interpretation, its influence on other governments, and related laws in the United States.

History

The FOIA was necessitated by the dramatic growth of the federal government in the 20th century. A confluence of circumstances brought open-government legislative efforts to fruition in 1966. The U.S. Constitution does not provide a right of public access to inspect or copy government records. The first statute to provide comprehensive public access was the Administrative Procedure Act of 1946 (APA), of which the FOIA today is a part. Initially, the APA was limited, vesting broad discretion in agencies and permitting access only to “persons properly and directly concerned” with records. Abuses of government secrecy were well publicized and frustrated Congress, journalists, and the public.

Attorney Harold Cross documented government secrecy in a report to the American Society of Newspaper Editors, published in the influential 1953 book, *The People's Right to Know*.

Responding to this frustration, Congressman John Moss, a Democrat from California, began in 1955 to press for access reform and to hold hearings on government secrecy. Legislation to expand APA access was introduced in Congress as early as 1957, though no bill gained traction until the APA came under review in 1963. Moss found long-sought bipartisan support for a bill in 1965. Federal agencies unanimously testified against the proposed legislation, and the Department of Justice doubted its constitutionality. Nevertheless, owing in significant part to press editorial pressure, the FOIA passed the Senate, and passed the House unanimously, in 1966. President Lyndon Johnson (1963–1969) signed the bill into law without ceremony at his Texas ranch on Independence Day, July 4, 1966. The holiday was coincidental; the president was unenthusiastic. He issued a signing statement asserting that the FOIA “in no way impairs the President's power under our Constitution to provide for confidentiality when the national interest so requires.”

FOIA Today

The FOIA applies to the executive branch of the federal government, including independent agencies, the military, and the Executive Office of the President, but excluding the president and vice president, and their immediate staffs. The FOIA does not apply to Congress, the courts, nongovernmental recipients of public funding, the District of Columbia, or state governments. As a general matter, the FOIA provides that when any person requests access to the records of a public agency, the agency must provide them unless they come within one of the nine FOIA exemptions. The FOIA also requires that agencies provide information and indexes for public guidance.

Pursuant to the FOIA, “any person” (not just journalists) may request records from a public agency. The agency must fulfill a request that “reasonably describes” the records sought. Records are defined broadly to include not only documents but video and audio recordings, and data stored in

electronic media. An agency must undertake “reasonable efforts to search for” requested records, including automated searching, but need not create new records.

Records must be produced in the form requested as long as the records are “readily reproducible” in that form. An agency may charge a “reasonable” fee for searching, reviewing, and duplicating records, but noncommercial and news media requesters may not be charged for searching and reviewing. A waiver of search and copying fees is available to requesters with noncommercial, journalistic, and other public interest objectives. Agencies are compelled to respond to requests, not necessarily to fulfill them, within 20 working days (4 weeks), absent “unusual circumstances” warranting extension. As a matter of practice, some federal agencies (such as the FBI) are renowned for backlogs running from weeks to years. An agency must offer expedited processing for the requester who “demonstrates a compelling need,” which may include urgent newsgathering.

Exempt from mandatory disclosure under the FOIA are:

1. classified national security records;
2. records of “internal personnel rules and practices”;
3. material specifically made exempt from disclosure according to a statute other than the FOIA;
4. confidential “trade secrets and commercial or financial information”;
5. agency memoranda and letters that would be privileged in litigation (sometimes termed “working papers” or “predecisional” records);
6. personnel, medical, and other records “the disclosure of which would constitute a clearly unwarranted invasion of personal privacy”;
7. certain law enforcement records, including those which “could reasonably be expected to interfere with enforcement proceedings” and those which “could reasonably be expected to constitute an unwarranted invasion of personal privacy”;
8. reports generated in the supervision of financial institutions; and
9. geological information about oil and gas wells.

The scope of some exemptions is controversial and subject to perpetual litigation. For example,

Exemption 4 balances commercial secrecy in the free market with government accountability, as regulated companies provide volumes of data to government. In 2019, the U.S. Supreme Court rejected a bid by investigative journalists to access information about retailers’ redemption of food subsidies. The holding lowered the threshold for commercial actors to resist disclosure of competitively sensitive data, despite the public interest in the accountability of public programs.

Records must be redacted of exempt information before their release. When an agency claims an exemption to support denial of access to records, the agency may produce (indeed, may be compelled by a court to produce) an itemized inventory of undisclosed records and claimed exemptions, termed a *Vaughn index* after a 1973 federal court case.

The FOIA requires that an agency publish in the *Federal Register* rules, procedures, and FOIA forms, as well as a description of its organization. Agencies also must publish online their final orders and opinions; policies and interpretations; staff manuals and instructions, such as they affect the public; annual FOIA compliance reports; and records previously produced under the FOIA that are likely to be requested again. The FOIA authorizes agencies to promulgate and enforce their own internal FOIA policies and procedures, as long as they do not contravene the law. The online publication requirements added by 1996 amendment have led agencies to create “electronic reading rooms,” websites where agencies post information as required by the FOIA and provide additional guidance to FOIA requesters about the agency’s own policies and procedures.

Every federal agency must designate an official to receive FOIA requests. If a requester does not receive a response to a request or believes the agency has improperly claimed exemption, the FOIA requires that the agency provide a process of administrative appeal. For the requester who is dissatisfied with the outcome of an administrative appeal, the FOIA authorizes suit against the agency in federal district court. If a court determines that FOIA noncompliance was “arbitrary and capricious,” disciplinary action may be taken against responsible federal employees.

Interpreting the Law

Influential in interpretation of the FOIA are executive orders of the president, memoranda and policies of the attorney general and Department of Justice, the Office of Government Information Services (OGIS), and the body of federal case law that has arisen from a half-century of FOIA litigation. Executive predilection has vacillated between greater and lesser disclosure. Executive orders of the president in 1982, 1995, and 2003 created and revamped the system for national security classification, leading to fluctuating receptivity to access. At the agency level, attorney general memoranda in 1993, 2001, and 2009 also varied in the approach to FOIA, with the successive documents instructing agencies to employ loose presumptions favoring disclosure, secrecy, and disclosure, respectively, when FOIA exemptions, such as those concerning agency memoranda, are discretionary.

The 2007 OPEN Government Act created the OGIS within the National Archives and Records Administration. Acting as a FOIA ombudsman, OGIS has become an important clearinghouse for FOIA policy and research. The agency administers public education and agency training on FOIA, assesses agency compliance, prepares an annual report on FOIA efficacy, and mediates FOIA disputes.

The federal courts have developed a voluminous body of case law interpreting the FOIA. A key U.S. Supreme Court decision involved journalist requests for access to “rap sheets,” or criminal information histories, maintained by the FBI. In *Department of Justice v. Reporters Committee for Freedom of the Press* (1989), the Court stated that the “central purpose,” or “core purpose,” of the FOIA is to inform people about “what their government is up to.” The rap sheets revealed information about private individuals, not about the government, the Court reasoned, so access was denied. Though the case ostensibly involved only the law enforcement-personal privacy exemption, the “central purpose test” proved broadly influential in FOIA interpretation. For example, though *Reporters Committee* was not cited, “central purpose” thinking animated the widening of Exemption 4 in the case discussed earlier.

The *Reporters Committee* decision was also an important interpretation of the FOIA privacy

exemptions because the Supreme Court accepted an argument predicated on “practical obscurity.” The federal rap sheets contained information aggregated from the records of state and local law enforcement agencies, and the information generally was available to the public from those underlying sources. That availability did not preclude application of the federal privacy exemptions, the Court decided, because the geographic dispersion of the source data rendered it practically obscure.

As FOIA turned 50 in 2016, it was swept into the vitriol of American politics on both sides of the aisle. In 2018, the Electronic Privacy Information Center failed in its bid to access tax returns of Republican President Donald Trump and his family in search of evidence of Russian election interference. Conservative watchdog Judicial Watch used FOIA to obtain hundreds of pages of emails sent by 2016 Democratic presidential candidate Hillary Clinton, and filed related lawsuits against multiple federal agencies seeking access to other documents from Clinton’s time as secretary of state.

Journalists and the FOIA

Because journalists historically have advocated vigorously for open government, the FOIA is commonly regarded as a law for journalists. But studies of FOIA usage consistently show otherwise. Though precise numbers are difficult to ascertain, estimates place journalist requests at just 5% to 10% of hundreds of thousands of FOIA filings annually. Commercial actors account for a plurality to a majority of requests, which include queries about government contracting and data mining by information brokers. Journalist requests are far outpaced also by requests from individual citizens, including researchers, historians, and the simply curious.

The FOIA is arguably ineffective for many journalists. They complain that the FOIA process is too slow for timely newsgathering because of agency resistance to disclosure, the 20-day time frame, agency backlogs, inadequate enforcement mechanisms, and sluggish courts. Important stories such as the Pentagon Papers in 1971 and the Iran–Contra affair in 1986 were based upon government leaks or investigative reporting, not upon voluntary government disclosures. Critics therefore charge that the FOIA is only as useful as the government is cooperative.

Nevertheless, the FOIA has made countless news stories possible and remains an important tool, especially in historical research and long-term investigative projects. For example, records disclosed under the FOIA brought to public attention the health consequences of dioxin exposure resulting from the use of “Agent Orange” defoliant in the Vietnam War. Public record disclosures were instrumental also in exposing programs of domestic government spying on civil rights activists in the 1960s and 1970s. Access advocates have observed that the existence of FOIA aids journalism even when the law is not invoked, because its presumption of access and potential for litigation encourage the fulfillment of informal requests for information.

Influence

Most states had open records laws before the FOIA was enacted in 1966. Nevertheless, the federal FOIA was influential in bringing about open records laws in the remaining states, and federal court interpretation of the FOIA is influential in state court interpretation of open records laws.

Though the FOIA was not the first such law in the world—it had antecedents in Sweden and Finland—it served as a model for a modern generation of statutory access regimes around the world. Access to information (ATI) is now incorporated as a norm in many national constitutions and is recognized as a human right by the world’s regional human rights courts. In a 2006 case about the environmental impact of development in Chile, the Inter-American Court of Human Rights—in a decision not binding in this respect on the United States—recognized a “right of access to State-held information.” Today, abundant nongovernmental organizations, such as the global Access Now, advocate for ATI within and among nations.

Related Laws

Several federal disclosure laws complement the FOIA. The Privacy Act of 1974 permits persons access to public records about themselves. The Presidential Records Act of 1978 governs access to, and retention of, records of the president and vice president and their immediate staffs. Public access to meetings in the federal government is

provided in limited fashion by the Government in the Sunshine Act of 1976 and by the Federal Advisory Committee Act of 1972.

Conclusion

Despite its shortcomings, the FOIA plays a critical role as an instrument for journalists and the general public to ensure government accountability in the United States. As a corollary to the freedom of speech and press embodied in the United States in the First Amendment, the right of access to information has become recognized as essential to a functioning democracy. The FOIA is therefore unusual among U.S. statutes in that it plays a fundamental role in American law and journalism to fulfill the promise of the constitutional freedom of expression.

FREELANCE WRITERS AND STRINGERS

Freelance journalism, work created by independent writers and stringers, not employed by any one media organization, has long been a career path for journalists who either favored the autonomy of self-employment or considered it a gateway toward full-time employment. The 21st-century media landscape has been shaped by financial, political, and technological upheavals that have challenged this employment model. The role of the freelancer is critical in any discussion of journalism practice, because of the growth in the number of journalists working as freelancers today and the increasing reality that more opportunities exist for journalists outside the newsroom than within. As demand for diverse media content continues to grow, so too have the demands on freelancers seeking to navigate a rapidly evolving landscape. This entry defines freelance journalism and explores how it has changed over time, especially since the popularization of digital media platforms.

Defining Freelance Journalism

The phrase “free lance” dates back to the Middle Ages and was originally coined as a term to describe mercenary knights. A “free” lancer was an available soldier who could defend a lord for a

price. By the turn of the 20th century, the *Oxford English Dictionary* officially recognized the term *freelance* as a verb. The term *freelancing* is now used to describe a person who is self-employed and earns a living by selling their services and skills to different employers.

Freelance journalism is work produced by journalists who are not employed by any one media organization. Freelance journalists are self-employed workers who contract their services to several media companies. This work can comprise news or sport reports, features, investigative stories, opinion pieces, photos, videos, podcasts, and increasingly more often a combination of all. Freelancers produce piecework (work paid for according to the amount produced), for a number of different outlets. Some freelance writers provide copyediting services or produce branded content (sponsored content funded by advertisers), in order to supplement their income. A stringer is a subcategory of freelancer who works under contract for a particular media organization but is not a full-time staff member. Like a freelancer, a stringer is paid for each piece of work that an organization publishes or broadcasts. Freelance journalists are generally paid a flat rate per article produced, or paid by the word.

A *kill fee* is the term used to describe a payment made to a freelancer when a commissioned assignment is cancelled. Larger news organizations often depend on local stringers for breaking news stories, when it’s not possible for them to reach a location quickly. In areas of conflict, locally based freelancers often operate as fixers or news gatherers for media organizations that have closed their international bureaus. Freelancers are used in all aspects of journalism work today, involving every media platform, some of which depend entirely on freelance labor. The increase in freelance journalists comes amid an increasing desire from employers for more flexibility from workers. Paradoxically, while this has resulted in more work opportunities for freelance journalists due to the growth of digital first media companies, it is often for less pay.

Freelance Journalism in an Evolving Media Landscape

From the mid-1990s it was clear that digital technology was going to transform the business

of journalism and play a defining role in its future. One of the key challenges facing the news media since losing its monopoly on information has been competition from both established and new sources offering free online content. This continues to present challenges for an industry reeling from more than a decade of digital disruption, and still searching for sustainable business models in a market saturated with free content. Despite determined efforts by the news industry, the 2019 Oxford Reuters *Digital News Report* reveals just a slight increase in the number of consumers paying for online news, whether by subscription, membership, or donation. The average proportion paying for news was 11% in nine countries surveyed and the findings suggested that most people were unlikely to pay for online news in the future, at least for the kind of news content they were already accessing for free. Growth in the number of consumers willing to pay was limited to a handful of countries mainly in the Nordic region (Norway, 34%; Sweden, 27%) while the number paying in the United States (16%) remained stable after a significant jump in 2017 (often attributed to the so-called “Trump bump”).

But technology alone is not the only challenge facing the news industry in a time of great political and economic upheavals. Indeed, newspaper circulations started to fall in the late 1980s and early 1990s, well before the arrival of the Internet, when old forms of broadcasting began to break up allowing people wider choices of TV and radio. But there is little doubt that the rate of decline in newspaper sales has accelerated since the rise of digital platforms. The shift from traditional modes of delivery to digital and mobile platforms resulted in significant downsizing of editorial staff and an increased reliance on freelance journalists and stringers. The 2015 American Society of News Editors annual newsroom census revealed a 40% decline in editorial staff at U.S. newspapers between 2006 and 2014. According to figures from the U.S. Bureau of Labor Statistics (BLS) in 2018 there were 37,995 reporters and correspondents employed as staffers by newspapers, publishers, broadcasters, and other outlets, while about 83,968 people were self-employed writers and authors, a

category which included those who write for digital news organizations and blogs. The BLS report also predicted that the number of employed reporters and correspondents would decrease by 10% through 2026, while the ranks of freelance writers and authors would grow by 8% during the same period.

This increased reliance on freelancers has meant that freelance journalism is no longer considered an “atypical” form of work in journalism, meaning work that does not offer income or job security, nor health benefits, maternity leave or other benefits attached to permanent jobs. By 2011, the European Federation of Journalists (EFJ) reported the proportion of freelancers working in some parts of central Europe was as high as 60%. A subsequent study, carried out by the EFJ in 2015 revealed how 50% of online journalists working in countries across Europe did not have a full-time contract. In the United Kingdom, the number of freelance journalists increased by 67% from 2000 to 2015 according to a survey carried out by the National Council for the Training of Journalists (NCTJ). Interestingly, some 44% of those surveyed stated they chose to freelance while 39% said it was a mixture of both push-and-pull factors. In its findings, the NCTJ predicted the rates of self-employment might vary over time and attributed the rise in freelance journalism to a possible “cyclical blip.” However, over four fifths (82%) of those surveyed believed they would be still working as a freelance journalist in 2020.

The NCTJ survey was also supportive of the common perception that freelance journalism earnings are relatively low. While the average pay for all journalists from national data sources in the United Kingdom is £30,884, data from the Freelance Journalist survey, published in 2016, suggested the average freelance earnings was in the region of £19,500, while 44% of those surveyed earned less than £15,000. A survey carried out by the Writers Union of Canada in 2015 revealed that writers’ earnings had declined by 27% from 1998; the average income of the 947 writers surveyed was \$12,879. According to the BLS, the median pay for writers and authors was \$61,820 in 2017, but that figure masks business expenses and benefits, such as health care, which freelancers must independently purchase.

Freelance Journalism Work

Successful freelancers enjoy the flexibility and freedom of being their own boss and the autonomy to pursue the type of work they choose. However, the work of many freelancers, including some of the most successful, is heavily influenced by the challenges of low pay, insecure employment relations, and the amount of unpaid time spent self-promoting, self-branding, and self-marketing, usually on social media platforms. The disappearance of freelance budgets, costly health insurance, and contracts that don't allow work to be resold or offer protection against libel, has made some freelancers less inclined to invest in more time-consuming research-heavy projects, such as in-depth investigative reporting. A survey of investigative freelance journalists called *Untold Stories*, undertaken by the advocacy group Project Word in 2015, revealed how 81% of respondents forfeited hundreds of important public interest reports due to resource constraints. It also highlighted a trend of declining incomes; nearly half the respondents (44%) reported getting paid less and nearly one quarter (22%) by half as much.

Many freelancers adopt a systematic approach to their work where they focus on regular news beats or work that is guaranteed to generate a stable revenue stream. In most markets, freelance journalists are not paid for the time spent researching work but only for the final product produced, so earning capacity is a key influencing factor on the type of journalism work pursued by freelancers. This has implications for journalism's watchdog role in society and the type of news discourse found in the media.

Despite the precariousness of their lives, much of the international research on freelancers indicate that they like their work. For example, 82% of UK freelancers surveyed in 2015 by the NCTJ said they liked freelancing so much, they had no plans to quit. Studies that have taken place in Belgium, Sweden, and Norway also indicated journalists were satisfied with their freelancing life notwithstanding the economic uncertainty, describing it as both a lifestyle and a job. In her study of Canadian freelance journalists, Nicole Cohen discusses that despite the thousands of journalists laid off in Canada between 2008 and 2015, the media force has grown with more

people working as freelancers but often not by choice. Cohen's research highlights the double-edged nature of freelance work, which can be simultaneously precarious and satisfying, risky, and rewarding.

Freelancing on the Frontline

As the news industry continues to weather economic storms, bureau closures and declining staff numbers, freelancers have become an essential part of the profession, in particular for international reporting. A lot of journalism, especially from areas of conflict, is built on the backs of freelancers who are often willing to cover stories that staff journalists are unable or sometimes unwilling to cover. This is often done with no insurance and uncertainty around pay. For freelance journalists working in conflict zones, the increased risk to their safety has elicited debate around how they should manage themselves. The dangers some journalists face, particularly working in countries like Syria, where hundreds of journalists have been killed since the beginning of the conflict in 2011, has seen some news organizations review their policies regarding the use of freelance work. Freelance war correspondent James Foley was beheaded in 2014 after being captured while on assignment in Syria. On February 12, 2015, more than two dozen news organizations and advocacy groups gathered at Columbia University's Graduate School of Journalism to endorse worldwide freelance protection standards. However, the principles do not address "on spec" work, which is when freelancers offer content to a news outlet that has not been commissioned. The Committee to Protect Journalists (CPJ) believe this is an area where editors can get the best of both worlds; enjoying access to content without having to take responsibility for its production.

Even before the COVID-19 pandemic in 2020, millions of freelancers were working in systems where they took risks. During lockdown periods and travel restrictions, freelancers, like many self-employed workers, grappled with new ways of remote working. The global economic shutdown sparked by the COVID-19 public health crisis saw many media outlets postpone or cancel freelance assignments, which further exposed the

vulnerability of freelancers who rely on commissioned work. Freelance photographers, sports reporters, travel writers, theater and music critics were among those hardest hit by the widespread cancellation of large-scale public events including sporting events, concerts, and arts festivals. During lockdown periods, even though journalists were classed as essential workers, many freelancers did not have the freedom to report on the public health pandemic in particular “on spec” reporting. This was down to lack of access to vital personal protective equipment needed to cover COVID-19 safely and not having proof of commissioned work. The impact of this affected not only the livelihoods of freelancers but also had implications for public interest journalism especially in countries where mainstream media rely heavily on freelance journalists. In an interview with the CPJ in April 2020, freelance journalist Neha Dixit, the recipient of CPJ’s 2019 International Press Freedom Award, spoke about the difficulties experienced by freelancers in India trying to work during the COVID-19 crisis, because in India there is no independent press body that gives press cards to freelancers. According to Nadine Hoffman, deputy executive director at the International Women’s Media Foundation, which launched a fund to support journalists through the crisis, many freelancers reported cases of media outlets refusing to pay kill fees for stories commissioned before the shutdown or for work that was in process. A survey carried out in April 2020 by the Southern African Freelancers’ Association revealed how more than half of respondents lost 70% of their income, while 33% lost 100% during the shutdown.

Funding Freelance Work

The Internet has made publishing more accessible than ever and freelance journalists are blogging or using other social platforms to promote their work. Freelancers must often compete with academics, business consultants, and industry or medical experts willing to write free articles in exchange for media exposure, to boost their professional profiles. Similarly, freelancers are often lured by the offer of exposure in particular those at apprentice or early career stage, where there are often less opportunities for paid work. The

concept of “hope labor” is sometimes used in studies of this type of arrangement where workers engage in unpaid or undercompensated labor in the hope that other paid opportunities might follow. Payment models used by some online news websites that employ freelance journalists link earnings to website traffic or “clicks,” which can give a publication a competitive advantage, as it does not risk paying a writer more than their content will earn for the site. However, it also means journalists may not risk investing time on a story that does not attract traffic or hit targets. This practice not only raises concerns for the type of journalism work produced but also has questions for labor management relationships, if for example managers of websites that pay writers a bonus based on traffic have an obvious incentive to manipulate traffic statistics to avoid making these payments.

In the past, freelancers were often free to sell the same article to different publications, however some of the current publishing contracts often allow media outlets to republish an article in other publications without paying any additional fees or reproduction costs. The migration to online platforms has also seen story lengths shrink, which means fewer words and less earnings for freelancers who are often paid by word. For freelance journalists seeking out new financing models, controlling the labor process can sometimes trouble the concept of autonomy. The practice of crowdfunding—whereby journalists rely on micropayments from donors to finance their reporting—can sometimes give rise to conflict for those who strongly believe in the journalistic norm of autonomy, but at the same time feel responsibility toward their funders.

The internet, according to the National Union of Journalists (NUJ), a trade union for journalists in the United Kingdom and the Republic of Ireland, has not only undermined the prevalent business model for the news industry, but it has devalued what most journalists produce—namely news and other content. The amount of content produced by the so-called citizen journalist, the term used to describe participatory or public journalism and the degree to which smartphone technology has handed everybody the capacity to be an ‘on-the-spot reporter’, and to publish news

and views to the world, has transformed the audience from a consumer to producer role. The use of user-generated content where readers' photos, videos and tweets are used—often without any return bar possible social prestige—has brought new voices into journalism discourse and has also stimulated discussion around the crucial fact-checking role of journalists when gathering and reporting verified information. Some digital publications such as the HuffPost often have a pool of content suppliers who write for prestige, which in turn can lead to the displacement of paid journalists and photographers. Some editors have even approached experienced freelancers with the same request, albeit with limited success as demonstrated in 2013 by freelance journalist Nate Thayer's highly publicized response to an editor at *The Atlantic* who asked him to repurpose a previously published blog piece for their site for free. As Thayer responded, I am a professional journalist who has made my living by writing for 25 years and am not in the habit of giving my services for free to for-profit media outlets so they can make money by using my work and efforts by removing my ability to pay my bills and feed my children. (as cited in Coates, 2013, n.p.).

Freelancing and the Future

Technology is transforming publishing and business models and freelance journalist are continuing to adapt and experiment within this time of great change. Historically, journalists believed in the separation of business and marketing concerns from editorial decisions. Consequently, the administration involved in running a business can sometimes come as a shock to freelance journalists. However, with commissioning budgets slashed; content freely available online; technology, delivery and, payment models constantly changing, freelance journalists, like media organizations, must continue to seek out sustainable business models. Maintaining an active social media presence is considered an essential, if not integral part of work in journalism today. Due to the increasingly competitive nature of the craft, freelancers are often afraid to "switch off" for fear of losing a story to a competitor, including the citizen journalist, blogger, or user-generated content.

This effectively means freelance journalists' commodity is not simply their finished work or content but rather their time spent as almost permanent eyes and ears for the newsmaking industry. For most freelancers this also involves the need to network, self-brand, and build profiles on social media. Moreover, if a key and growing part of the journalism corps—freelance journalists—cannot afford to spend time on investigative reports or public interest stories, this may lead to worrying silences in news discourse, as it leads to journalists only focusing on predictable events that guarantee income. Furthermore, the blurring of consumer and producer in an industry increasingly more reliant on user-generated content has implications for the professional role of journalism in society, as more and more journalists find themselves working as freelancers.

FULLER, MARGARET

Sarah Margaret Fuller Ossoli (1810–1850), known as Margaret Fuller, was a journalist, editor, and literary critic. She was the first U.S. woman to work full-time as a newspaper’s book critic and was the first woman to cover war for a newspaper. Her book *Woman in the Nineteenth Century* is considered the first major feminist work in the United States. Fuller was an advocate of women’s rights, especially women’s education and the right to employment. An important contributor to the articulation of Transcendentalism, which emphasized the inherent goodness of people, she also encouraged many other reforms, including prison reform and the emancipation of slaves. This entry explores Fuller’s early life and work and her career as a foreign correspondent.

Early Life and Work

Fuller was first taught at home in Cambridge, Massachusetts, by her father, a Harvard-educated lawyer who was elected to several political positions, including one term in Congress. Disappointed that

his first (of nine) child was not a boy, Timothy Fuller provided Margaret a rigorous classical education, including in Latin, of a kind not usually afforded girls; at age seven she was reading Virgil, Ovid, and Horace. Her father forbade her from reading etiquette books and sentimental novels, although her mother taught her sewing. The downsides to this intellectual development were nightmares and sleepwalking as well as other forms of mental and physical suffering, according to her published *Memoirs*. Fuller did have a few years of formal schooling, including at a school for girls. But she felt that she was unlike other women her age, or, for that matter, at all womanly. Fuller therefore studied on her own, learning several languages.

Already when she was in her 20s, Fuller hoped to earn her living through journalism and published works of literary criticism and reviews. Her first piece appeared in 1834 in the *North American Review*. But she was deeply affected by the death of her father due to cholera, and she wanted to take care of her widowed mother and younger siblings, so she sought better-paying jobs. Fuller became a teacher, first at the controversially progressive Temple school in Boston founded by the Transcendentalist and abolitionist Bronson Alcott and then for 2 years at a school in Providence. Although she thought she could not learn from women teachers, her teaching style followed that of Elizabeth Palmer Peabody, whom she succeeded at Temple.

In 1839, she returned to Boston, where, inspired by the nascent Transcendentalist movement and conversations with Transcendentalist figures, she launched *Conversations*, widely ranging discussions for women, to compensate for lack of quality education for women. The participants, many of them women’s rights advocates, discussed fine arts, history, literature, and nature, among other topics. Fuller also posed the “great questions” facing women, encouraging her conversational partners to state and examine their opinions. In 1841 Fuller experimented, unsuccessfully in her view, with opening up the series to men, including several major Transcendentalists, who assert that people can generate original insights without deferring to past masters. Transcendentalists emphasize subjective intuition and self-reliance; society and its institutions, they said, corrupted the individual.

Early Journalistic Work

In 1839, a group of intellectuals led by Ralph Waldo Emerson founded *The Dial*, a transcendentalist quarterly. Fuller edited it for its first 2 years. (She never got her annual salary of \$200 and *The Dial* died in 1844 for lack of subscribers and revenue.) Her “Short Essay on Critics” appeared in its first issue. She produced important writing for *The Dial*, including after she no longer was editor. Fuller’s *The Great Lawsuit: Man versus Men, Woman versus Women* appeared in 1843. An expanded book version of this, titled *Woman in the Nineteenth Century*, appeared as part of Horace Greeley’s “Cheerful Books for the People” series in 1845; a pirated version was published in England and Fuller earned no royalties given the lack of international copyright laws. Considered one of feminism’s major treatises, the essay and book proposed that, consistent with Transcendentalism, everyone has the power to become enlightened. Man was still burdened with selfish desires, according to Fuller. Moreover, having inherited depravity from Europe, America had not achieved equality. This explained the status of women and of Native Americans and African Americans. She urged abolitionists and women’s rights adherents to use similar language and logic. But Fuller proposed that humans were on the verge of a new awakening and women and men, whose souls are the same, would soon be equals. She claimed that each person must be a self-dependent individual. For women to achieve this, men needed stop dominating, but women also needed to remove themselves from man’s dominating influence. Fuller also warned women to be careful in marriage and not to become dependent on their husbands. Fuller also advocated equal educational rights for women, so that women could push for equal political rights and employment, so that they were not confined to what were seen then as “feminine” jobs, such as teaching. By 1893, *Woman in the Nineteenth Century* was reprinted 13 times.

Among the admirers of the book were Edgar Allan Poe, Henry David Thoreau, and William Cullen Bryant. Later admirers of Fuller include Eleanor Roosevelt and the many women suffragists, including Susan B. Anthony and Elizabeth Cady Stanton, who credited her as inspiring the

movement, specifically the Seneca Falls Convention in 1848.

But Nathaniel Hawthorne, who previously supported Fuller, criticized her, as did his wife, Sophia Hawthorne, who had attended some of her “Conversations” but now said she disliked the book’s tone and disagreed with Fuller’s characterization of women and men. Fuller, who was widely regarded as overly self-confident and ill-tempered, was apparently the inspiration for two of Hawthorne’s characters, Hester Prynne in *The Scarlet Letter*, and Zenobia in *The Blithedale Romance*. Well after Fuller’s death, her friends were urged to contradict nasty comments by Hawthorne’s son Julian, who wrote in a letter to the *Boston Evening Transcript* that few readers would be grief-stricken at the death of such a dismal fraud and who included in his book about his parents a cruel assessment by Nathaniel Hawthorne of Fuller’s (im)moral character. Thomas R. Mitchell asserts that the son was intentionally setting up Fuller as a fallen “new woman” to heighten the contrast to his manly father and devoted husband with the ideal wife.

Woman in the Nineteenth Century also reflects Fuller’s research for her first book. In 1843, she traveled to several cities on the Great Lakes, where, among other things, she met with several Native Americans. She described her experiences in an 1844 book called *Summer on the Lakes*; she also did research for the book at Harvard College’s library, becoming the first woman allowed to use Harvard’s library.

In 1844, Horace Greeley hired Fuller as a literary critic at the *New York Tribune*, making her the first full-time book reviewer in U.S. journalism and later, its first woman editor. To minimize both expenses and the scandal of working in a largely masculine newsroom, according to Carolyn Mitchell, she lived in and worked from the Greeleys’ home in New York, although she and Greeley often sparred, and was decently paid at \$500 a year. She reviewed American and foreign books, concerts, lectures, and art exhibits. During her 4 years with the publication, she published more than 250 columns, most signed with an “*”. Journalists at the time rarely used real bylines, however, and this does not seem to represent an attempt to hide her gender.

Fuller wrote about many issues besides art and literature, including political and social issues such as slavery and women's rights. Having visited Sing Sing, where she interviewed women prisoners and stayed overnight, she highlighted the problems of prisons and women inmates, many of whom were prostitutes. Fuller's reporting on New York charities exposed the squalor and suffering at an alms house, a mental asylum and the penitentiary on Blackwell's Island. She was just as passionate, or strident, in supporting the rights of African Americans, depicting slavery as toxic.

Career as a Foreign Correspondent

In 1846, the *New York Tribune* sent Fuller to England, France, and Italy, as its first woman foreign correspondent. Between 1846 and 1850, she wrote 37 pieces for the *Tribune*, having been advanced \$120 for her first 15 dispatches. Her reputation and her books, as well as personal friendships and professional contacts, opened doors for her. She interviewed many prominent writers. George Sand, the French writer and Socialist, however, disappointed Fuller, when Sand told Fuller that she chose not to run for the French National Assembly, because women were not prepared for political office. Fuller likewise expressed disappointment with the reactionary politics of the historian, philosopher, and satirist Thomas Carlyle.

Soon after getting to England, she met Giuseppe Mazzini, a journalist, politician, and spearhead of the Italian revolutionary movement that worked for the unification of Italy, as opposed to many separate states, some of which were controlled by foreign countries. Mazzini was then in exile in England, having been kicked out of Switzerland and France. When Fuller got to Italy, in 1847, she met one of Mazzini's supporters, the revolutionary Giovanni Angelo, Marchese d'Ossoli, who involved Fuller more deeply in the revolutionary movement. They became lovers, lived together, and had a son, Angelo Ossoli, in 1848. They may have married, although both scholars and contemporaries are divided about that. Fuller wrote her mother about Ossoli and the baby in August 1849, explaining that she had first kept silent to avoid upsetting her.

The couple even more actively supported the revolution, with the proclamation of a Roman Republic in early 1849. Fuller volunteered at a supportive hospital, nursing the wounded and carrying supplies to the post where Ossoli was fighting. Meanwhile, her "Dispatches from Rome" passionately detailed the bloody French siege of Rome. David Dowling credits her correspondence as the country's sole source of information on Italy's political turmoil and the Risorgimento. When the republicans were defeated, however, Fuller and Ossoli fled Italy. In 1850 they decided to move to the United States. Fuller had already started a book about the rise and fall of the Roman Republic and she hoped to find an American publisher, a British one having rejected it.

A few days before Fuller, Ossoli, and Angelo boarded a merchant cargo freighter, Fuller wrote about her fears, given various omens that gave her a dark feeling and even a vague expectation of a crisis. At sea, the ship's captain died of smallpox. On July 19, 1850, just at the end of their 5-week voyage to New York and less than 100 yards from a large barrier island near Long Island, the ship hit a sandbar. Some passengers and crew members survived. At the urging of Ralph Waldo Emerson, Henry David Thoreau went to New York to search the Fire Island shoreline. Angelo's body had washed ashore. But the body of neither Fuller nor Ossoli was recovered, nor was Fuller's manuscript on the Roman Republic.

Within a week after her death, Horace Greeley suggested to Emerson that he quickly write a biography of Fuller, believing that public interest in Fuller would soon dissipate. In February 1852, *The Memoirs of Margaret Fuller Ossoli* was published, edited by Emerson and two other friends, James Freeman Clarke and William Henry Channing. Much of Fuller's work was deleted or altered and the book omitted details about her love affair with Ossoli as well as an earlier relationship, even as it focused on her character and minimized her work and especially her radical ideas about politics, religion, and sexuality. In any case, while interest in Fuller's importance did fade, the *Memoirs* were reprinted four times by the end of 1852. Fuller's brother also collected many of her writings in two volumes, having omitted several of her letters

from Europe as too radical and socialist; these volumes were also reissued several times. Most of Margaret Fuller's extant papers are at Houghton Library at Harvard and the Boston Public Library, where readers can see how her biographers not only edited her image but also literally cut up her letters to serve the editing process.

GAG ORDERS

A gag order prohibits an individual from speaking or publishing about a particular matter. Although gag orders can take numerous forms, the term is commonly used to describe a court order restricting speech about pending litigation. Gag orders can impact journalists' reporting in two significant ways. First, a court may issue a gag order that directly prohibits members of the media from broadcasting or publishing information about a case. Such a direct restriction on the press is subject to a heavy presumption of unconstitutionality under the First Amendment and will rarely be upheld. Second, a court may issue a gag order that does not apply directly to speech by journalists but that restricts the speech of others—such as lawyers, parties, or witnesses—who journalists would rely upon to gather information about a case.

Most courts have applied a less stringent standard when considering the constitutionality of gag orders on attorneys, parties, and other individuals directly involved in a case. Because such gag orders impede journalists' newsgathering rights, however, courts have often allowed the media to challenge gag orders that apply to trial participants or witnesses, even if those orders don't directly prohibit speech by the journalists themselves. Gag orders may also take the form of statutes, administrative rules, or regulations. This entry further discusses the purpose of gag orders, the different groups to whom gag orders apply,

and media challenges to gag orders imposed on others.

Gag Orders as Tools to Manage Pretrial Publicity

Gag orders limit the dissemination of information about ongoing litigation in an effort to avoid pretrial publicity that may hinder the parties' rights to a fair trial. Gag orders may be issued in both criminal and civil cases. Because gag orders operate as prior restraints on speech, they raise serious concerns under the First Amendment and are generally presumed to be unconstitutional. This presumption may be overcome, however, when the government can show that the order is narrowly tailored to protect a compelling public interest.

In criminal cases, the Sixth Amendment to the U.S. Constitution guarantees the accused the right to an "impartial jury," which is considered a basic requirement of due process. The U.S. Supreme Court has recognized that sensational and hostile trial coverage can permeate the community from which the jury is drawn to a point where the defendant's due process rights are violated. As such, the Supreme Court has recognized that trial courts have an affirmative duty to minimize the harmful effects of pretrial publicity in criminal cases. (*Sheppard v. Maxwell*, 384 U.S. 333 [1966]).

This does not mean, however, that a jury must consist only of individuals who have no knowledge about the case. The Supreme Court has held that even "pervasive, adverse" pretrial publicity does not automatically lead to an unfair trial.

(*Nebraska Press Association v. Stuart*, 427 U.S. 539, 554 [1976]). The Supreme Court has noted that judges can use measures short of gag orders to mitigate the impact of pretrial publicity. These measures may include changing the venue of the trial to another location, postponing the trial until media coverage dies down, questioning prospective jurors about information they learned outside of court, and providing clear instructions to jurors that they may render decisions only based on the evidence presented in open court. Because these measures do not implicate the same First Amendment concerns as a gag order, courts have generally held that a trial judge must determine that these alternatives will not adequately protect the right to a fair trial before resorting to a gag order. If the trial judge does issue a gag order, a typical form of gag order may enjoin attorneys, parties, or witnesses from making out-of-court statements about certain matters that the trial court believes may bias the jury pool and endanger the defendant's right to a fair trial.

The Sixth Amendment right to a fair trial applies only to criminal prosecutions. Courts have differed on whether gag orders in civil cases should be subject to the same test as gag orders in criminal matters. For example, the U.S. Court of Appeals for the Third Circuit held that the standard should be the same, noting that because the Seventh Amendment preserves the right to trial by jury in federal civil cases, fairness in jury trials is a vital constitutional right in both civil and criminal cases. (*Bailey v. Sys. Innovation, Inc.*, 852 F.2d 93 [3d Cir. 1988]). The Seventh Circuit, on the other hand, concluded that the concerns about fair trials in criminal cases are stronger than those in civil matters and that restrictions on attorney speech in civil cases should thus be less readily justified by fair trial concerns. (*Chicago Council of Lawyers v. Bauer*, 522 F.2d 242, 257–58 [7th Cir. 1975]).

In both criminal and civil cases, courts have applied different standards to assess the constitutionality of gag orders, depending on whether the orders restrict communications by the media, the attorneys, the parties, or other trial participants.

Gag Orders on the Media

The U.S. Supreme Court has made clear that gag orders that directly restrict the media are

presumptively unconstitutional prior restraints on speech, which are the “most serious and least tolerable infringement on First Amendment rights.” (*Nebraska Press Association v. Stuart*, 427 U.S. 539, 559 [1976]). In *Nebraska Press*, the trial court sought to limit pretrial publicity regarding the murders of six family members in a small Nebraska town, a crime that attracted significant local and national media attention. Members of the press challenged a restraining order that enjoined them from reporting information about the defendant's confessions or other information that was “strongly implicative” of the defendant's guilt. This included restricting information about the defendant's confession that had been introduced in open court during a pretrial hearing.

The Supreme Court held that the gag order could not overcome the presumption of unconstitutionality. The gag order restraining the media could only be valid, the Court concluded, upon a showing that: (1) there was a clear and present danger of actual prejudice to the defendant's right to a fair trial; (2) alternative means of protecting the defendant's right to a fair trial, such as change of venue, were inadequate; and (3) the gag order would be effective in protecting the defendant's right to a fair trial. The Supreme Court concluded that the trial court had failed to demonstrate that it had considered measures short of an order restricting speech and that there was doubt as to whether the gag order would be effective since rumors could travel by word-of-mouth in the small community where the murders occurred. Finally, the Supreme Court found the gag order defective for additional reasons, including that it prohibited the media from reporting on information communicated in open court hearings and that its wording was impermissibly vague.

Just a year later, the Supreme Court held unconstitutional a trial court order enjoining the press from publishing or disseminating the name or picture of a juvenile defendant in a murder case. Reporters learned the juvenile's name during an open detention hearing, and a news photographer took the boy's photo as he was being escorted from the courthouse. After the boy's name and image were published and broadcast in local media, the judge entered an order prohibiting further dissemination of the name or photo of the juvenile. The Supreme Court held, however, that

the First Amendment did not permit a trial court to bar the publication of widely disseminated information that was obtained at an open court proceeding. (*Oklahoma Publishing Co. v. District Court in and for Oklahoma County*, 430 U.S. 308 [1977]).

Under the demanding standard of *Nebraska Press*, gag orders on the media have survived only in rare cases. In 2004, the Colorado Supreme Court upheld a trial judge's order prohibiting media organizations from revealing the contents of transcripts from closed hearings in the high-profile sexual assault prosecution of a National Basketball Association star that had been sent to the media in error. (*Colorado v. Bryant*, 94 P.3d 624 [Colo. 2004]). The state's high court upheld the prior restraint on publication, finding that the state had an interest of the "highest order" in protecting sexual assault victims' privacy relating to information that would not be admissible under the state's rape shield statute. The state supreme court, however, directed the trial court to make a quick determination as to what evidence from the closed hearing would be admissible and decide whether any or all of the transcribed proceedings could then be made public.

Gag Orders on Attorneys

Given the high bar that must be satisfied to issue a gag order that applies to the media, courts looking to control prejudicial pretrial publicity have instead often turned to gag orders on attorneys, parties, and other trial participants.

The Supreme Court has not addressed the standard for court-imposed gag orders on attorneys. In *Gentile v. State Bar*, however, the Supreme Court held that the speech of lawyers representing parties in pending cases may be regulated under a less stringent standard than the high standard the Court applies to restraints on the media. (*Gentile v. State Bar*, 501 U.S. 1030 [1991]). In *Gentile*, a defense attorney challenged his punishment for violating a Nevada state bar rule that prohibited attorneys from making out-of-court statements in connection with their representation of clients if the attorney knows the statement would have a "substantial likelihood of materially prejudicing" judicial proceedings.

Although the Court concluded that the state bar rule was unconstitutionally vague as

interpreted by the state in *Gentile's* proceeding, the Court held that the "substantial likelihood" of prejudice standard applied to out-of-court attorney speech did not violate the First Amendment. The Court found that there is a heightened interest in regulating speech by lawyers because they are considered officers of the court and have "special access to information" that makes their statements likely to be perceived as particularly authoritative. The Court concluded the rule imposed only "narrow and necessary limitations on lawyers' speech." The Court did not address whether the "substantial likelihood" test was a minimum constitutional threshold or if a less demanding standard could also be applied to attorney speech.

Although *Gentile* involved a state bar rule rather than a court-issued gag order, the Court's reasoning in *Gentile* has been applied by some lower courts to hold that gag orders on attorneys may be evaluated under a more permissive standard than the clear and present danger standard applied to gag orders on the media. Even so, the lower courts have still considered whether gag orders restricting attorneys are narrowly tailored and the least restrictive means of avoiding prejudice. Two years after the Supreme Court's decision in *Gentile*, for example, the Second Circuit overturned a gag order barring counsel for all parties in the World Trade Center bombing trial from publicly discussing any aspect of the case. (*United States v. Salameh*, 992 F.2d 445 [2d Cir. 1993]). Although the Second Circuit noted that the speech of attorneys representing clients in pending cases may be subject to greater limitations than could constitutionally be imposed on the press or other citizens, it concluded the gag order was broader than necessary to protect the defendants' Sixth Amendment rights and the integrity of the judicial system.

In 2014, the Alabama Supreme Court directed a trial court to rescind a protective order that prohibited the plaintiffs' counsel in a group of civil cases alleging fraud by a pest control company from making any out-of-court reference to the circumstances of the cases and to require plaintiffs' counsel to remove all mention of the cases or their facts from their website and social media pages. (*Ex parte Wright*, 166 So.3d 618 [Ala. 2014]). The state high court found the order invalid, concluding it was not narrowly

tailored and did not use the least restrictive means necessary to protect the defendant's right to a fair trial.

Courts have also tried to restrict attorney speech through local court rules. The Fifth Circuit considered an attorney's challenge to a local district court criminal rule that prohibited an attorney "associated with" either the prosecution or defense at a trial from making any out-of-court statement for public dissemination related "to the trial or the parties or issues in the trial." (*In re Goode*, 821 F.3d 553 [5th Cir. 2016]). The Fifth Circuit found that the rule operated as a prior restraint on the attorney's speech, but could be analyzed under the less demanding standard of *Gentile*. Even so, the court held that the rule was unconstitutional as applied to the attorney because it was not narrowly tailored to prohibit speech that was substantially likely to materially prejudice the case and was not the least restrictive means of guarding against such prejudice.

Gag Orders on Other Trial Participants

The Supreme Court has not ruled on the standard to be applied to gag orders that restrict the speech of nonlawyer trial participants, such as parties and witnesses, and lower courts have disagreed about what standard applies in such cases. Some courts have treated gag orders restricting speech by trial participants as prior restraints subject to the same stringent standard that the Supreme Court applies to gag orders against the media. Other courts have approved gag orders on trial participants under a lower standard, requiring only a "substantial" or "reasonable" likelihood of material prejudice. In addition to requiring an actual risk of prejudice, these lower courts have typically required that the trial court demonstrate the order is narrowly tailored and that less restrictive alternatives would not suffice.

The Fourth and Tenth Circuits have held that a trial court can restrain out-of-court statements by trial participants if it determines the comments pose a "reasonable likelihood" of prejudicing fair trial rights. In 2018, the Fourth Circuit applied this standard in evaluating a gag order imposing stringent restrictions on trial participants in a group of civil nuisance suits brought against the hog farm industry. (*In re Murphy-Brown, LLC*, 907 F.3d 788 [4th Cir. 2018]). With only limited

exceptions, the order prohibited the parties, their counsel, and all "potential witnesses" from making any extrajudicial statement to the media relating to the trial, the parties, or the issues in the case that could interfere with a fair trial. The court struck down the gag order on a challenge by the defendant hog farm operator, holding the trial court had failed to show there was a "reasonable likelihood" that a party would be denied a fair trial absent the order. The Fourth Circuit also questioned whether the gag order may actually increase the risk of prejudice, because it prevented parties from "disseminating accurate and timely information" while the media continued to cover developments in the case.

The Fifth Circuit has required a showing of a substantial likelihood of prejudice to justify gag orders on nonattorney trial participants. In 2013, the Fifth Circuit applied this test to invalidate a trial court order requiring the plaintiff police officers to take down a website used to communicate information about their case that contained critical statements about the defendant police department. (*Marceaux v. Lafayette City-Parish Consol. Government*, 731 F.3d 488 [5th Cir. 2013]). The appeals court stated that the case demanded a "nuanced approach" to the balance between "avoiding a tainted jury pool and the rights of parties to freely air their views and opinions in the 'market square' now taking the form of the electronic square known as the Internet." The court held that the trial court erred in concluding that the entire website was substantially likely to cause prejudice.

Other courts require a showing of an imminent threat or clear and present danger to restrict the speech of trial participants. The Sixth Circuit, for example, has held that the "clear and present danger" test that the Supreme Court applied to gag orders on media in *Nebraska Press* also applied to gag orders that restrict criminal defendants. (*United States v. Ford*, 830 F.2d 596 [6th Cir. 1987]).

Finally, where a court seeks to restrict parties from communicating information gained only through the court-ordered exchange of documents and information that is part of the litigation process, the Supreme Court has held that such orders are "not the kind of classic prior restraint that requires exacting First Amendment scrutiny." (*Seattle Times Co. v. Rhinehart*, 467 U.S. 20, 33 [1984]).

Instead, the court may restrict the dissemination of such materials upon a showing of “good cause,” as long as the court does not forbid dissemination of information gathered independently of the court’s discovery rules.

Gag Orders on Jurors and Grand Jury Proceedings

Courts recognize a special interest in protecting the secrecy of jury deliberations that is not applicable to other judicial proceedings. For trial juries, courts have explained that free debate among jurors may be stifled if jurors believe their individual arguments and opinions would be disclosed to a wide audience.

The Fifth Circuit upheld a posttrial order prohibiting jurors in a high-profile criminal trial from being interviewed “concerning the deliberations of the jury” without special permission from the trial judge. (*United States v. Cleveland*, 128 F.3d 267 [5th Cir. 1997]). The appeals court found the order was narrowly tailored because it prohibited only the disclosure of information about the discussions occurring among jurors within the jury room and did not prevent jurors from being interviewed about their own general reactions to trial proceedings. The Tenth Circuit, on the other hand, struck down a trial court’s order prohibiting jurors in a high profile civil case from discussing their verdict “with anyone,” (*Journal Publishing Co. v. Mechem*, 801 F.2d 1233 [10th Cir. 1986]). The court concluded that the order was impermissibly overbroad because it was unlimited in time and scope. The trial judge could not issue such a “sweeping restraint,” the appeals court concluded, absent a compelling reason.

In the grand jury context, the Supreme Court has recognized that the proper functioning of the grand jury system requires confidentiality to protect grand jury witnesses and jurors from potential influence or retribution, guard against the risk of flight by individuals who are about to be indicted, and protect the reputations of individuals who are suspected of wrongdoing but exonerated by the grand jury. In a 1990 decision, the U.S. Supreme Court struck down a Florida statute that prohibited grand jury witnesses from disclosing the testimony that they gave before the grand jury. The Court held that to the extent the law prevented witnesses from disclosing their own testimony

about information they possessed before they testified before the grand jury, the state could not prohibit witnesses from sharing that information once the investigation has ended. (*Butterworth v. Smith*, 494 U.S. 624 [1990]).

Media Challenges to Gag Orders on Others

State and federal courts have recognized that a news organization may challenge a gag order imposed on another individual when the gag order impedes the news media’s “rights under the First Amendment to gather news . . . and to receive speech from willing speakers.” (*In re The Wall Street Journal*, 601 F. App’x 215 [4th Cir. 2015]). Media organizations have been permitted to challenge pretrial gag orders on trial participants, as well as posttrial orders restricting juror communications. Some courts, such as the Third Circuit, permit such challenges by the media only when there is evidence that a person restrained by the gag order would otherwise be willing to speak. (*United States v. Wecht*, 484 F.3d 194 [3d Cir. 2007]).

GANNETT

Gannett is the largest newspaper publisher in the United States. Following its 2019 merged with GateHouse, it owned an assemblage of 260 daily newspapers. Despite its size, Gannett’s stock price fell 40% in the first 6 months following the

merger. The deal, financed with a \$1.8 billion loan from a private equity company, led one Wall Street analytics firm to predict there was a one-in-three chance the consolidated company would soon go bankrupt.

Gannett's troubles have not yet been as dramatic as other large newspaper chains, which have been sold and/or broken up, often by hedge funds and asset management firms operating through bankruptcy proceedings. But Gannett's place in the descending fortunes of newspaper chains, while unique, is also a commonplace story of how debt, dropping stock prices, incursions from Internet competitors, and the decline in print-on-paper newspaper circulation has decimated one of the once most profitable industry sectors in the United States. This entry examines Gannett's history, launch of the national newspaper *USA Today* and subsequent acquisitions, and legacy.

History of Gannett

Gannett has been a longtime player in the burgeoning growth of American newspaper chains. In 1906, Frank Gannett purchased a half ownership of the Elmira (NY) *Gazette* as a launching point for buying up smaller dailies throughout the Northeastern United States and beyond. In 1923, he combined his newspaper holdings into a solely owned operation.

The Gannett Company joined the New York Stock Exchange in 1969 and grew to 79 newspapers by 1979. In that year, Gannett acquired Combined Communications, which brought into the fold its first large newspapers, *The Cincinnati Enquirer* and the *Oakland Tribune*, along with seven federally licensed metro television stations. Gannett's national profile also received a boost when its Washington, DC bureau won a Pulitzer Prize in 1980. It sponsored the inauguration of President Ronald Reagan the same year, and the company relocated its headquarters from Rochester (NY) to twin high-rise towers in the D.C. suburbs of Rosslyn, Virginia in 1986.

Founded in 1943, the Gannett News Service provides the company's newspapers with national, state, and local angle news from bureaus across the nation. In the early 1970s, prominent national political columnist, Jack Germond, then Gannett's D.C. bureau chief, described the chain as an

anonymous bunch of "shitkicker newspapers" (Germond, 2005, p. 105). However, with the 1973 ascension of Al Neuharth as successor to CEO Paul Miller—a former Associated Press executive and Gannett's leader since shortly before the death of Frank Gannett in 1957—the company was quickly redesigned for high-profile success in the go-go atmosphere of 1980s' market-driven journalism and publicly traded newspaper chains as top Wall Street performers.

In 1974, Neuharth brought in company loyalist, John Curley, to replace Germond—an important figure in Timothy Crouse's book, *The Boys on the Bus*, about the 1972 Nixon-McGovern campaign press. Some saw the move as symbolic of the newspaper business' transition from raucous presidential press packs and *The Washington Post's* epic-making Watergate reporting to a new corporate environment. Curley was a dedicated news professional, but as Poynter Institute writing coach, Roy Peter Clark observes, he accepted the realities of maintaining a journalistic ethic within a company culture which valued "self-promotion and executive salaries" more than "a common good grounded in excellent news coverage."

Launch of USA Today

The centerpiece of Gannett's rise to reputation was the company's founding in 1982 of its national newspaper, *USA Today*. With its use of splashy color, reader-friendly factoids, and once-over-lightly news content, the paper can be seen as the quintessential product of the marketing principles percolating throughout the industry of the 1970s and 1980s. *USA Today* utilized the latest developments in readership research and computer and satellite technology to make the paper a ubiquitous presence—printed at Gannett newspapers around the country, sold in space-age news boxes, and pushed under hotel doors by the bulk-buying hospitality industry. Its bright and light content and promotional formulas were called *radically innovative* by its many imitators. But others felt the newspaper lent a franchisers' feel to daily journalism and labeled it "McPaper" and "junk food journalism."

The celebrity-seeking Neuharth ensured that his personality was associated with the company's growth and its relentlessly accelerating earnings.

He placed an emperor-style bust of himself in the lobby of Gannett's new headquarters and titled his autobiography, *Confessions of an S. O. B.* Neuharth "liked sticking thumbs in the eyes of the big guys," said Richard Benedetto, a top reporter at *USA Today*, after Neuharth's death in 2013. But he described the South Dakota-born Neuharth's belief in a "journalism of hope" as coming from "the heartland and unity was his vision."

In 1989, Neuharth turned over the chairman's reigns to Curley and left to head the Freedom Forum (as he renamed the Gannett Foundation). Although he was only occasionally heard from (Neuharth tried, for example, to manipulate the company from afar by threatening to sell off the foundation's Gannett stock), he made his last major splash when he engineered the 2008 move of the Freedom Forum's historical "Newseum" to a location close to the White House.

Meanwhile Gannett settled into a less attention-getting, but highly acquisitive, period under Curley's and his successors, Douglas McCorkindale's, Greg Dubow's, and Gracia Martore's, more modest leadership. The company had acquired additional stature when it added admired newspapers—*The Des Moines Register* in 1985, *The Courier Journal* (Louisville, KY) in 1986, and the *Detroit Free Press* in 2005—although some critics felt they lost their professional edge under Gannett's management. Increasingly the action in Gannett was in TV affiliate stations. While typically selling off radio properties it acquired, Gannett had collected 50 local TV outlets by 2015 when the company was split into two: TEGNA, which kept the television properties, and a newspaper company (retaining the name Gannett). This was followed in 2019 by the merger of Gannett's 92 newspapers, plus *USA Today*, with GateHouse's newspaper properties. Even though GateHouse investors hold a 50.5% interest—and its top official is former GateHouse president, Mike Reed—the consolidated company also kept the name Gannett.

In recent years, Gannett has accelerated digital growth by expanding its role in streaming video, online marketing, software management, and cloud-based computing. *USA Today*—which has a huge online readership but generally provides only a small percentage of Gannett's revenue—has seen a big drop-off in print-on-paper

advertising. But the newspaper is used to provide company synergy, and its national reporting has been incorporated as inserts in some of Gannett's larger newspapers. Nonetheless Gannett is viewed like other legacy media companies as encumbered with its "old" media structures and habits. Its newspapers have been followers rather than leaders in adopting paywalls or state-of-the-art websites. The coronavirus pandemic delivered a blow to the core of *USA Today's* target markets—affluent travelers, the hospitality industries, fans of sports statistics, and business news. This has trapped the newspaper within digital, demographic, and industry forces. Its news content is not substantial enough to beat out its national competitors, *The New York Times*, *The Wall Street Journal*, or *The Washington Post*, and its niche on the Internet not financially secure enough to fend off competitive threats. *USA Today* is an "oddly mid-market, Middle American medium with flyover country warmth," says the NiemanLab's Ken Doctor. The newspaper has "personality," he adds, "but not of this era."

One can see Gannett as a pacesetter within the newspaper industry's successes in the 1970s and 1980s, but falling behind in addressing newspapers' contemporary challenges. Gannett has continued to be a leader in promoting women, diversity in management, and press freedom issues. *USA Today* survives—but largely to perpetuate the company's brand. Gannett's many one-city newspapers have carried on without closing shop as in other cities. However, its unsparing budget and staff cuts throughout the 2000s have provided the "gravitational force" that has continuously pulled Gannett newspapers "back to the middle of the pack," Clark says.

Legacy

In historical terms, Gannett has a mixed legacy. The company has been an adroit utilizer of federal tax and inheritance laws favorable to chain acquisitions. But it also has been accused of using monopolistic tactics in its business practices, which triggered congressional hearings in 1977. It has improved some of its one-city newspapers but taken advantage of federal joint-operating agreements and left markets when faced with

competitor resistance. As it purchased more local TV affiliates, the company's effort in the late 1980s to expand *USA Today* into a national TV show was a bust. The company's attempt in 2016 to buy the Tribune Company fell through after depressed Gannett earnings reduced the value of its stock offer. This was followed by a narrow escape from a hedge fund-supported takeover company known for hollowing out distressed newspapers. As a final blow, the Newseum was closed by the debt-laden Freedom Forum in 2018. The totality of this has meant Gannett has not escaped the crushing damage to publicly traded newspaper groups—and, while it now sits atop the sector, it does so with a tarnished image.

GATEKEEPING

The term *gatekeeping* refers to the process by which information can be included or excluded by a mediator prior to reaching an audience. It has been conceptualized both as a normative journalistic role and as a theory. The concept was initially developed by David Manning White in 1950 through a published article “The ‘Gate Keeper’: A Case Study in the Selection of News” in *Journalism Quarterly*. White was inspired by the work of social scientist Kurt Lewin, who used the term to describe the organizations that could affect the distribution of food. As this entry shows, gatekeeping has proven to be a resilient concept in mass communication theory. Long before digital technology challenged the assumptions of numerous theories, gatekeeping theory had already been adjusted and reshaped in relation to changes in media.

The theory emerged from the observations made during the legacy media era—an era in which the content decisions for a mass audience were made by editors and, it was assumed, passive audiences would simply receive the content presented. In its earliest iteration, gatekeeping theory sought to understand how news was selected for publication in legacy media. Given this tie to legacy media, it is then unsurprising that theory has been critiqued—the theory’s vitality would seem to be inextricably tied to the vitality of legacy media. After all, while White’s “Mr. Gates” could only make room for one story out of every ten in the news, contemporary news platforms have either lessened or eliminated restrictions on the amount of content. Yet the theory has remained viable in part because the theory’s foundational interest in accounting for the fact that not all information is equally available. Through the lens of this foundational interest, gatekeeping then refers to the factors that inhibit or promote information flow. This remains essential in discussions of our contemporary mediascape. The transition in gatekeeping, Timothy Vos argues, has not led to the “termination of gatekeeping” (2015, p. 11).

It is at times postulated that gatekeeping is less consequential if such an array of gates is available, yet, as Vos points out, the array of gates does nothing to affect change in the role of the individual gatekeeper. Journalists generally argue that their function in the gatekeeping process includes tasks ranging from serving as a public forum to checking abuses of power—certainly these are also roles performed elsewhere. Hence, while many gates may be available, this does not change the gatekeeping role journalists play in news selection—and given the amplification of elite sources on social media and elsewhere—in some ways their role may be *more* valuable as opposed to less.

Rather than becoming obsolete, gatekeeping has been drawn upon in recent years as a concept useful for calling attention to the role played by digital platforms in the presentation of news, through supplementary concepts such as “algorithmic gatekeeping” or “gate programming.” These concepts subtend the argument that the process of gatekeeping is increasingly being done by artificial intelligence and computers. As Peter

Bro notes, there are three different models of gatekeeping characterized by information, communication, and elimination. In the information model, journalists decide what news is included or ignored in the news media as a result of interaction with news sources—the aim in this model is to provide the public with information. In the second model, gatekeeping occurs through a facilitative process through which citizens and decision makers interact with journalists and collectively help produce the final news story—the aim in this model is ensuring communication. In the third model, journalists are left out of the process. Citizens and decision makers interact directly through means of social media technologies and can produce and publish news of their own. This final model, Bro argues, actually represents a return to the bygone era of direct communication where powerful institutions took it upon themselves to communicate directly with citizens.

White’s initial study concluded that it was the personal traits of editors that motivated the selection of news, and while this finding was heavily critiqued, it served as a basis for research emphasizing the role of newsrooms routines and practices and newsroom socialization in gatekeeping news. Indeed, this finding has proven to be so helpful in the development of gatekeeping theory that, more than 70 years later, William P. Cassidy argued that routine forces had a greater impact on gatekeeping decisions for journalists than individual factors. One of the routines natural to the gatekeeping process is the application of a set *rubric* for assessing newsworthiness. Johan Galtung and Mari Holmboe Ruge argue that 12 values including “frequency, threshold, unambiguity, meaningfulness, consonance, unexpectedness” (1965, p. 70) have served as a means through which journalists assessed newsworthiness. A central question of gatekeeping has always been that, given the diversity of journalists, and the diversity of news organizations, how is it that journalists are capable of “producing such a narrow range of news messages” (Vos, 2015, p. 7)? In contemporary research, this concern has morphed into an examination of the wide array of gates—an array of gates that can allow information to the public even if hundreds of gates have been closed to the information.

In classical gatekeeping theory, there are five levels of analysis: individual, communication routines, organizational, social institutions, and social system. The individual level of analysis concerns the characteristics of the individual gatekeeper, such as is represented in the classic study by White, and might look at the communicative products of individuals such as emails, blog posts, and social media status updates. According to David DeJuliis, the communicative routines level of analysis concerns the “practices of a profession embodied in instincts and news values and judgments” (2015, p. 9). This routine level is where the application of news values comes into play with the values of newsworthiness, and the practice of the inverted pyramid style of writing shared throughout the journalistic field. The organizational level of analysis is where news organizations differ—the media environment affecting a community newspaper would naturally differ from that of a daily, city newspaper. The social institution level of analysis focuses on the actors on an organization, such as advertisers, governments, and activist groups; media outlets may adjust their news in relation to the expectations of such social institutions. Finally, the social system level of analysis focuses on the most abstract forces of culture, ideology, and economics on gatekeeping.

So, for example, in a research study on a national level newspaper, the study might acknowledge the social system in which the newspaper has operated—taking into account the media system and the underlying paradigm. At the institutional level, research scholars often look at the texts resulting from institutions—the sort of metajournalistic discourse—in order to assess the gatekeeping process. The organizational and routine level of analysis might apply ethnography and interviews in order to understand the media environment and the routines that operate within it. The communicative and individual levels of analysis might apply the use of surveys and interviews in order to understand the application of news values and how an individual selects stories.

In a synthesized model of gatekeeping proposed by Shoemaker and Vos, the authors argue that the constructs of gatekeepers, gates, forces, and channels are as relevant now as they were when the concept was first proposed. This model argues that raw information flows through three

gatekeeping channels: sources, media, and audience. Information enters the source channel through experts, commentators, and observers. The media channel is entered by reporters, editors, and production staff. The source and media channels flow together to offer news content. The third channel—that of the audience—takes information from news content and social media. In this model, messages move through blogs, news outlets, and public relations agencies, and in each, boundary gatekeepers make decisions about what information to allow into their channel.

Such research is not only valid but imperative in the contemporary mediascape, where content aggregators play an outsized role in the presentation of information to the public. Journalists play an essential role in processing raw information to be presented to the public, thus amplifying the work of the content aggregators. Furthermore, the research also clarifies the reality that significant amounts of information never move through a journalistic gate. This then raises the question of the processes occurring in computer-oriented gatekeeping. Altogether this suggests that the vitality of the concept is well supported given its implication for journalistic practice, news literacy, audience engagement, and news values.

GERMANY

Journalism in the Federal Republic of Germany has both a long tradition and a contemporary foundation that places it consistently at the top of the list of countries favorable to journalists and press freedom.

With a population of 83.1 million, the Federal Republic of Germany is the largest country on the European continent. A founding member of the European Union, Germany has maintained a robust economy and attracts immigrants from Europe and beyond. Twenty percent of the population are of immigrant background. German is the official language of this federalist parliamentary republic. Its media system is a blend of public and commercial broadcast, as well as print and online-only outlets and is considered democratic corporatist. With more than 41.4 million households in Germany alone and with large German-speaking populations in neighboring Austria and Switzerland, it represents a significant media market.

This entry offers a history of journalism in Germany leading up to the contemporary news media system. It also provides an overview of the nation's print, online, and broadcast journalism traditions; media ownership and regulatory issues; press freedom and education; and explores some future developments of journalism in the Federal Republic of Germany.

History

Journalism in Germany, as in many European countries, has a long history. Prejournalistic forms

of news production and dissemination were common during the Middle Ages and into the early modern age. These were random exchanges of information delivered by poets and bards. Printer, publisher and inventor of the printing press and moveable type, Johannes Gutenberg, born in Mainz, Germany around 1400, is credited with initiating the printing revolution in Europe. By the 1600s correspondence journalists published news bulletins and reports, mostly unedited, in dozens of small, regional papers with a circulation of no more than 200–300 each.

While the Enlightenment brought with it a more intellectual citizenry, censorship of newspapers during the 1700s prompted the emergence of various forms of narrative journalism written by what scholars have called *part-time literary journalists* whose work was published in magazines and weeklies. Physical newsrooms and dailies, journalists as full-time professionals, and editing became the norm after the German Revolution of 1848–1849 and into the latter part of the 19th century and the first decades of the 20th century.

The Third Reich brought an end to the free press in Germany. Under the National Socialist regime, publishing houses were seized and news stories were limited and censored under a policy called *Gleichschaltung*, requiring all sectors of society, including news organizations, to follow party line.

Journalism in the 20th Century

Following World War II, the fate of the free press in Germany depended on the licensing requirements imposed by the allied powers in each of the occupied zones. They determined who could resume or begin publication and under what conditions. The Soviet Union issued the first license to the East German *Berliner Zeitung* in June 1945. In August of that year, the United States granted the *Frankfurter Rundschau* permission to publish.

France, Britain, and the United States had not been as strategic in their plans to revive journalism in what would become the Federal Republic of Germany (FRG), as had the Soviet Union in the East where hand-picked publishers and editors were installed, laying the groundwork for a largely state-controlled media system in the future German Democratic Republic (GDR).

Radio stations in the British occupied north began operating as early as 1945 and, following the publicly financed model of Britain's BBC, a network of regional radio and television broadcasters began to take hold. In 1950, the *Arbeitsgemeinschaft der öffentlich-rechtlichen Rundfunkanstalten der Bundesrepublik Deutschland* (ARD) [Working group of public-service broadcasting of the Federal Republic of Germany] was founded, building cooperations between the regional entities, with the ARD as national broadcaster. Economic and political independence as well as a mission to provide unbiased information to all citizens, financed primarily with monthly fees paid by all households with a radio or television set, were the pillars of this construct. Although advertisement has since become an important second source of revenue for these public stations, the public service mission has not changed. A second, national broadcaster, *Zweites Deutsches Fernsehen* (ZDF) [Second German Television] was founded in 1963.

Print publications like the weeklies *Der Spiegel* [Mirror] and *Die Zeit* [Time], dailies like *Der Tagesspiegel* [Daily Mirror] and *Die Wirtschaftszeitung* [Business Newspaper] received licenses, as did the publishing house *Springer Verlag* in Berlin. The *Deutsche Presse Agentur* (dpa) [German Press Agency] was founded in 1949 and remains Germany's largest press agency. By September 1949, a general license to publish was extended throughout West Germany.

Journalism in a Divided Germany

Until German reunification in 1990, the two news media systems differed fundamentally. In the GDR, licenses to publish and broadcast were given only to parties and large organizations. Some privately run newspapers survived for a few years after the war, but by 1953 they were shut down. Although press freedom was formally included in the constitution, restrictions imposed on journalists essentially muted the notion of freedom of information and expression. The dominating papers in the GDR were the party organ *Neues Deutschland* [New Germany] and the youth organization FDJ's *Junge Welt* [Young World]. Many citizens of the GDR turned their television antennas toward the West and tuned into West German programs.

The Federal Republic of Germany's constitution, ratified in May 1949, included an article guaranteeing freedom of expression and communication. Article 5 specifically guards against state censorship of the press, the arts and the sciences. The news media landscape that developed was pluralistic and largely decentralized, with regional newspapers, as well as national news outlets, primarily print and the previously mentioned network of public service broadcasters providing both regional and national coverage. The 1950s and 1960s saw a surge in tabloids, fueled by the Axel Springer publishing house and its flagship daily paper *BILD Zeitung*. The 1970s saw a concentration of media outlets and by the 1980s commercial interests began to change the publishing and broadcast landscape. The public-service broadcasting system became what is known as a *dual system*, allowing for advertisement and commercial broadcasters to coexist within the publicly funded system.

Reunification brought little change to the media landscape in the Federal Republic. Many journalists who had worked under the state-controlled system in the GDR left the industry, while some found employment in the West. The regional broadcasting network now had member institutions like *Rundfunk Berlin-Brandenburg* (rbb), a merger of the West German *Sender Freies Berlin* (SFB) [Station Free Berlin] and the East German *Ostdeutscher Rundfunk Brandenburg* (ORB) [East German Broadcast Brandenburg]. In 1991, the *Mitteldeutscher Rundfunk* (mdr) became the broadcast network covering three states in the former GDR, Thuringia, Saxony, and Saxony-Anhalt, thereby completing the takeover of the media system by the Federal Republic. Journalists from the former East German states continue to be underrepresented in newsrooms, particularly at the leadership level.

Deutsche Welle (DW) [German Wave], founded in 1953, is a government-funded, yet independent international broadcaster, producing radio and television programs in 30 languages.

Journalists

Employment statistics for journalists in Germany are not particularly reliable. According to 2019 census data, there were 87,175 newsroom employees such as editors, reporters, authors, and

editors-in-chief, of which 52.8% were women and 5.3% were not German. Sixty percent of the 1,732 interns working in newsrooms are women. The majority (77.8%) of newsroom employees are between 25 and 55 years old. Seventy-six percent work full-time and 24% are part-time employees. Fifty-nine percent have a university degree. In 2018, the number of freelance journalists was estimated at 27,000, a decline of 3,000 compared to the 2015 census. Full-time freelancers earn approximately €26,000 per year, compared to €52,000 for full-time employees. Women in this category earn an average of €41,700, whereas men earn €57,000 per year, that is, male journalists earn 27% more than female journalists. A pay gap also exists between print and online journalists, with print journalists earning €3,800 per month compared to the €3,600 their online colleagues take home every month. Most journalists are employed by daily print and online news organizations.

Although several collective bargaining agreements have been negotiated with unions specific to the profession, for example *Deutscher Journalisten Verband* (DJV), *Deutsche Journalistinnen und Journalisten Union* (dju), in recent years publishing houses have avoided adhering to these agreements by canceling agreements, by outsourcing projects or by creating separate business entities that fall outside of the unions' purviews. Employees of public broadcasters, much like civil servants, are compensated along rigid pay scales, although there is always room for negotiation.

Regulation

The German constitution or Basic Law [*Grundgesetz*] includes several articles that provide a framework for a free and independent press. Article 5 specifically addresses citizens' rights to freely express their opinions and to engage in uncensored and free press activities and publication. Although constitutionally guaranteed, the German government has not always honored this article. For example, in 1962 journalists working for the weekly newsmagazine *Der Spiegel* were prosecuted and accused of treason after reporting critically about the German defense department. Charges were dropped and the affair resulted in a number of resignations including that of the Defense Minister Franz Josef Strauss.

While several articles of the *Grundgesetz* constitute the equivalent of the United States Constitution's First Amendment, each German state or *Bundesland* has its own state press laws. Yet there are no substantial differences and all aim, on one hand, to protect citizens from unprofessional and unethical reporting practices and on the other hand to guarantee uncensored professional news reporting activities. Some of these guarantees include right to information laws and source protection.

In 1956, German journalists founded a press association [*Presserat*] in order to protect press freedom and to uphold professional standards by establishing an ethics code [*Pressekodex*] understood as a form of voluntary self-corrective. State laws regulating press freedom lean on the framework established by this press association. The *Presserat* is comprised of two professional membership organizations and two newspaper and magazine publishing associations and is largely membership financed. Since 1976, the German government has been making annual contributions, mandated by law, to the association. Complaints against news organizations and journalists who are seen as having violated the *Presserat's* ethics code are discussed and voted on four times a year. An official reprimand must be published by the news organization but has no legal consequences. In 2019, the association received 2,175 complaints and issued 34 official reprimands. According to the *Presserat*, inaccurate reporting, victim identification, and protection are more often cited than in previous years. The number of complaints received has been increasing since 2017.

Broadcast Journalism

The German broadcasting market is divided into two competing playing fields—public, fee-financed, partly commercial, bound by law to certain standards of content and private, commercial, driven by audience demand. The states have a strong role in public broadcasting, their parliaments vote on broadcasting laws. They control the supervisory entities that represent stakeholders such as parties, unions, and churches and agree on the stations' annual budgets and fees that every household is required to contribute. The fees are meant to guarantee public broadcasters' independence from

profit orientation and their commitment to the common good as opposed to daily swings in mood or taste.

When more frequencies became available through advances in cable- and satellite technology, the Federal Constitutional Court [*Bundesverfassungsgericht*] in a 1981 ruling allowed commercial programming. This resulted in the establishment of private radio and television stations. The intent was to deauthorize broadcast television and to broaden media power by letting in market forces. Since then the private sector has developed into a second force in the media landscape, clearly distinguishable in content and appearance from public radio and television.

Fifty percent of viewers in 2020 tuned into public broadcasting channels with the ARD reaching a market share of 11.3% and its regional channels 13.3%, whereas ZDF reached 13% overall. The two major commercial television groups, ProSieben Sat.1 and the RTL Media Group Germany, had a market share of 16.7% and 21.8%, respectively. Pay TV is becoming more popular. The ProSieben Sat.1 flagship channels ProSieben and Sat. 1 reached market shares of 4.3% and 6% while the RTL Groups' flagships RTL and VOX came in at 8.4% and 4.8%.

International streaming and on-demand platforms have not only profoundly changed viewer habits, they have also challenged classic broadcasting structures and pose a strategic challenge for both public and private German broadcasters who must defend their user fees and modes of revenue generation.

Print and Online Journalism

327 daily newspapers were published in Germany in 2019, with 1,452 local editions amounting to a print circulation of 13.52 million. In addition, 17 weeklies with a total print circulation of 1.61 million and six Sunday papers with a circulation of 1.74 million were published that year. This represents a slight decline over the previous decade. On the other hand, there were 698 online news sites in 2019, showing a steady increase. Yet advertisement revenue for daily newspapers has seen a sharp decline as Internet use has risen significantly, without the necessary increase in online advertisement sales.

Weekly news magazines have a strong tradition in Germany. *Der Spiegel*, *Stern*, and *Focus* are three of the most read titles among the 1,625 popular and consumer magazines on the market. Of these, 40% were sold through subscription and 46% through retail sales. The continued and rising interest in weekly, in-depth news coverage has benefited those publications that have offered ePaper editions and that are experimenting with online payment models. One beneficiary of these strategies, along with young, online readers who engage with longform journalism, is the weekly *Die Zeit*, based in Hamburg.

Most German media organizations and publishing houses are located in the former West Germany and are owned by West Germans. A notable exception is the *Berliner Zeitung*, the paper first issued a post-war license to publish by the Soviet Union in 1945. In 2019 multimillionaire investor Holger Friedrich, a native of Potsdam in the former FRG, and his wife Silke purchased the paper, only to be criticized for using it as a platform to publish their own opinion pieces.

German print and online news organizations are owned by a relatively small number of publishing companies. Among them are Axel Springer, Bauer Media, Bertelsmann, Burda Media, and Holtzbrink, followed by several companies focused on local news media such as the Madsack Media Group. Bertelsmann is by far the largest of these, with interests not only in newspaper and magazine publishing but also in radio and television (RTL Group), book publishing (Penguin Random House), music (BMG), in education, printing, and investments. Two thirds of its nearly €18 billion total revenue in 2018 was generated outside of Germany.

Regulation of Media Ownership

In keeping with its federalist structure, Germany's regulation of broadcast media concentration and competition is up to individual state media authorities [*Landesmedienanstalten*]. Mergers, for instance, must be approved by the *Kommission zur Ermittlung der Konzentration im Medienbereich* (KEK), a commission that determines whether or not a merger might result in market domination defined as controlling more than 30% of TV audiences or reaching a market share of

25% if the company also holds shares in another company related to the media industry. Several companies have tried to circumvent these regulations, for example by establishing holding companies. Regulation of newspaper and magazine ownership is also aimed at preventing monopolies, yet crossmedia ownership structures have put regulators to the test. In 2015, for instance, ProSiebenSat1, Germany's largest commercial broadcaster and Axel Springer SE, the largest European newspaper publisher, attempted a merger in the hopes of creating a €14 billion European digital hub. The project was dropped due to numerous regulatory concerns. Two years earlier, Axel Springer had sold the majority of its local newspapers and magazines to the Funke Media Group and purchased the television news broadcaster N24.

While Bertelsmann, a media conglomerate active in 50 countries as media, education, and service provider, has consistently ranked first among Germany's top-earning media companies, followed by public broadcaster ARD, ProSiebenSat1, and Axel Springer SE have held positions three and four. The landscape began to shift when in 2019 U.S. private equity investor KKR launched a successful takeover of Axel Springer.

The four largest telecommunications companies are Deutsche Telekom, Vodafone Deutschland, Telefonica Deutschland, and the E-Plus Group. Deutsche Telekom is Europe's largest telecom and ranks 6th globally. Although broadband accessibility in Germany is above the European average, its necessary expansion has been deemed a political priority. Several ministries have been charged with implementing the *Digital Strategie 2025* that aims to expand gigabit networks and infrastructures to every region, community, and household by 2025.

News Agencies

The leading news agency is the Deutsche Presseagentur (dpa) [German Press Agency], founded in 1949. It is based in Hamburg with a large news office in Berlin and regional offices throughout Germany and bureaus worldwide. It is a shareholder owned, private LLC. Thomson-Reuters and the Agence France-Presse (AFP) follow dpa and its subsidiaries in supplying German news

media organizations with subscription-based news services.

Nonprofit Organizations and Investigative Journalism

Germany hosts several efforts in collaboration, crowdsourcing, and nonprofit investigative journalism. *Correctiv*, a nonprofit newsroom has been shifting attention to local reporting using data journalism and crowdsourcing in their investigative stories. The foundation funded newsroom that was founded with an initial donation of €3 million in 2010 has since published the results of their international collaborations and cooperations with public broadcasters and magazines.

Netzwerk Recherche (nr) was founded in 2001 as a nonprofit association of investigative journalists. It organizes seminars and an annual conference that attracts national and international speakers and offers workshops, for instance on data journalism, security, and press freedom.

Journalism Education

There are close to two dozen journalism schools in Germany. Some are operated or sponsored by news organizations that place students as interns in newsrooms across platforms as part of their training, others are privately run academies. These competitive programs range between 1 and 4 years and provide both theoretical and practical training, networking, and job placement opportunities. Students are paid, much like apprentices in other industries. There are a number of universities offering journalism as a course of study as well.

Press Freedom

According to the press freedom watchdog organization Reporters without Borders, Germany continues to offer journalists a secure working environment. Yet several worrisome developments are noted. Attacks on the press, particularly from right-wing groups and supporters of populist movements who harass and threaten journalists, have increased since 2015. In addition, overly enthusiastic efforts to control online hate speech, have resulted in the removal of

content and data. Concerns have also been raised over laws penalizing journalists' use of information that has been leaked to them. Finally, mergers, buyouts, and newsroom closures may limit the availability and diversity of opinion crucial to a free and healthy press.

Controversies

Germany has not been without media scandals. In 1988, for instance, journalists turned a hostage situation in the city of Gladbeck into a spectacle, entering the hostage-takers' vehicle for an interview, guiding them out of town as they tried to make their escape. Unethical conduct of a different kind was at issue in 1983 when the magazine *Stern* published what they claimed were Adolf Hitler's diaries. The editors had paid millions for these fakes in a case that remains one of the largest media scandals in German history. At least two instances of reporters simply making up interviews that never transpired, have been made public, yet none shook the German media establishment as deeply as the case of the award-winning reporter Claas Relotius, who had produced numerous feature stories for *Der Spiegel*, *Die Zeit*, *SZ-Magazin*, *Frankfurter Allgemeine Sonntagszeitung*, and several others. When a colleague tried to alert his editors at *Der Spiegel*, he was not believed. It was not until two Fergus Falls, Minnesota citizens who felt that Relotius had falsely portrayed their town, wrote a scathing article about him, that he confessed. An internal investigation was conducted, and personnel changes were made at the magazine. *Der Spiegel* profusely apologized to its readers and published its professional standards along with a promise to strictly adhere to them. The overemphasis on narrative journalism that relied heavily on description and the obsession with producing award-winning long-form stories were blamed and promises were made never to let this happen again. Whether the 2019 incident has long-lasting effects on trust in the German news media is an important question for future research. Despite the many challenges, surveys indicate that the majority of German news media consumers continue to place their trust in established news outlets.

Future Developments

Readership has been shrinking across news publications, while public broadcasters struggle to attract younger audiences. Shrinking revenues, diversification of portfolios, and take-overs are rapidly changing the German news media landscape and will continue to do so. Although news consumption during the Covid-19 pandemic of 2020 increased noticeably, many news organizations offered their content for free during the crisis. These newsrooms put journalists on furlough, cut their hours or their jobs altogether. As media companies search for new sources of revenue, traditional boundaries limiting and regulating media concentration will shift. In 2020, for instance, the tabloid *BILD Zeitung* was awarded a license to offer livestreaming services, further accelerating the demise of specialized media outlets. Calls for more diversity in newsrooms that do not reflect the evolving and increasingly multiethnic population persist while anti-immigrant, populist, and right-wing parties simultaneously accuse mainstream news media of lying and acting as mouthpieces for the establishment and government interests. Gender equality in the newsroom will also continue to be a topic after the initiative ProQuote demanded at least 30% women in newsroom leadership by the year 2017, subsequently raising their demand to 50%.

Tensions between regulations guaranteeing freedom of expression, data privacy, and protection from hate speech on social media platforms will continue to strain a system that has consistently ranked high in freedom of press rankings.

GOOGLE

Google is an important actor in the media and technology landscape in the 21st century with profound impact on news media and journalism. This entry discusses the history of Google, controversies surrounding the company, and the interactions between Google and the news industry.

Google is a multinational technology company headquartered in the United States. Its core service

is its search engine service Google Search, which is by far the most popular search engine in the world, with more than 90% market share. As of 2019, the Google home page was ranked number 1 in global Internet traffic and engagement. In addition, Google provides over a hundred Internet-related services and products for individuals, businesses, and developers, with many of its products important parts of people's everyday lives in the digital era with billions of users around the world. For example, Gmail, Google's free email service, is the most dominant online email service with over 1.5 billion users worldwide; YouTube, the video sharing site that Google acquired in 2006, has 2 billion monthly unique users globally; and Google Maps is the most popular mapping app in the United States.

History

Google Inc. was founded in 1998 by Sergey Brin and Larry Page, both of whom were PhD students at Stanford University's Computer Science Department. The company was based on the founders' research in web search and data mining with the goal of making it easier to find high-quality information on the web. The name Google was a play on "googol" (10^{100}) to reflect the company's goal to make huge quantities of information available to everyone. On September 4, 1998, Brin and Page incorporated the company in their friend Susan Wojcicki's garage in Menlo Park, California. In March 1999, Google Inc.'s headquarters were moved to downtown Palo Alto, California, and then settled in a complex of buildings known as the *Googleplex*, in Mountain View, California. In 2020, Google had offices at over 78 locations across North America, Latin America, Europe, Asia Pacific, Africa, and the Middle East.

Google was a privately held company when it was founded in 1998. The company grew rapidly since then. In March 2001, Brin and Page hired Eric Schmidt as Google's first CEO to help them manage the booming business. Three years later, Google went public on August 19, 2004, at its initial public offering price \$85 a share. Google sold 22.5 million shares and raised over \$1.9 billion in the offering. Shares of Google rose 18.05%

to \$100.34 at the close on its initial public offering date. In 2015, Google restructured its business with Alphabet as the parent company and Google as its leading subsidiary. After the reorganization, Google had a new CEO, Sundar Pichai, who joined Google in 2004, while Page and Brin became the CEO and president, respectively, of Alphabet. In 2019, Page and Brin announced they were stepping down from the top roles at Alphabet but would remain on the board, while Pichai would become CEO of both Alphabet and Google.

Google profits primarily from online advertising. Google's advertising programs such as AdSense and DoubleClick Ad Exchange allow Google to play an intermediary role between website owners who produce online content and advertisers who seek online advertising space by matching text and display ads to the content and visitor interest of the given website. Advertisers pay Google based on the clicks of their advertisements, which they can track through Google Analytics. According to the financial results announced by Alphabet on February 3, 2020, Google's revenue reached \$160.743 billion in the 2019 fiscal year, among Alphabet's \$161.857 billion total revenues.

Controversies

As Google grew rapidly, there have been many controversies around the company. These controversies cover a large variety of issues, ranging from antitrust, privacy, copyright, censorship, labor practices, energy consumption, and much more. As far as its key services are concerned, some scholars found that its algorithms that determine Google's search results bias toward popular websites. Google was also found to focus more on Western perspectives than non-Western perspectives. In other cases, Google was involved in controversies about gender and race bias. For example, in 2014, Emily McManus, then managing editor of TED, searched for "english major who taught herself calculus" on Google, and Google suggested "Did you mean: english major who taught himself calculus?" The incident triggered wide public criticism of Google. Google responded by attributing such suggestions to issues related to its algorithms. In addition, Google is also criticized about its role

in the spread of misinformation, hate speech, and other harmful information through its platforms, especially its video-sharing site YouTube.

While a technology company, Google has played a big role in U.S. politics. For example, Google as well as other large technology companies were found to have closely collaborated with political staffers and actively shaped political communication during the 2016 U.S. presidential primary and general election campaigns. Since the 2016 U.S. presidential election, however, Google has been under fire in the political realm. In 2018, then U.S. President Donald Trump claimed that Google search results were "rigged" to be biased against conservatives when users searched for Trump-related news. In 2020, the U.S. Justice Department and multiple states' attorneys general filed three different antitrust lawsuits against Google, alleging the company engaged in anti-competitive practices to maintain its dominance in online search and advertising.

Pressure to regulate Google and other large technology companies also has come from the U.S. Congress. In 2018, Pichai testified before the House Judiciary Committee on its data collection, use, and filtering practices, addressing allegations of political bias and censorship and concerns over data privacy and hate speech. Earlier that year, Google declined to send a representative to a Senate hearing on foreign election meddling.

Outside the United States, in June 2017, European Union (EU) antitrust regulators fined Google a record 2.4 billion euros (\$2.7 billion) for abusing its market dominance. Google appealed, and in 2020 told a court that the EU's antitrust enforcer had no legal grounds for imposing the fine. In January 2019, the CNIL, the French data protection watchdog, fined Google \$57 million under the General Data Protection Regulation (GDPR), claiming that Google failed to comply with the GDPR in terms of the transparency and consent requirements involved in user data use. Google said the company is studying the decision to determine its next steps.

Google and News Industry

Google's practices and technologies have a profound impact on news media and journalism.

First, the development of Google and other technology companies has introduced new business models that challenge news media's financial sustainability in the digital age. News media in the United States traditionally depended on advertising revenue as their major revenue source to support the expensive cost of producing news. In the digital age, however, advertisers spend more money on online advertising than on the traditional advertising that brings in more revenue for news organizations. The newspaper sector, in particular, has been hit badly by this trend.

Since the early 2000s, the growth of online advertising has correlated with the decline of the newspaper industry's advertising revenue. The decline in advertising revenue and newspaper circulation has led to a surge in newsroom employee layoffs and newspaper closures. Since the second half of the 2010s, Google and Facebook have built their duopoly to dominate the digital advertising market with Google leading the market share. In 2019, Google and Facebook made up a combined 60% of the digital advertising industry in the United States, up 3% from the previous year, which was roughly \$65 billion in revenue. Google accounted for about 36% of the digital advertising market. Since 2018, Amazon's market share has grown quickly to catch up to the Google-Facebook duopoly.

In addition to the financial impact, Google has also influenced news production, distribution, and consumption. In the digital age, Google and other large technology companies have become important distribution channels for news. More people, especially young people, are getting their news from digital platforms, such as search engines, social media, and mobile apps. As Google has become many people's starting point to browse the web and seek information, news media's online presence to a great extent depends on how well their news performs in Google's search results. As a result, some newsrooms have adopted the search engine optimization (SEO) strategies, such as strategically using keywords in news headline writing, to improve the visibility of their content in search results. Critics express concern that such strategies serve commercial interests at the cost of editorial standards, while others argue that SEO rules highlight the basic facts in news. At the

same time, there have been critical reflections in newsrooms in terms of how to balance technological adoption and journalistic values.

Due to these digital developments, there has been a complex relationship between Google and news organizations. While Google and the news media compete for advertising resources and audience attention, they also depend on each other to serve their respective needs in the digital information flow. Google depends on news media for news information and news media depend on Google for referral and online traffic. In fact, Google's news-related business started early in its history. One of the landmarks of Google's news endeavors was the launch of Google News in 2002.

Google News

Google News is Google's news aggregation service at the URL news.google.com. Google does not produce news itself. Instead, it aggregates news from news sources worldwide; it then processes and presents the news based on its own computational algorithms. This process is mostly automated. As of 2019, Google indexes over 80,000 news sources worldwide. Google claims that it sends over 10 billion clicks to publishers' websites per month. Data from 2020 shows that Google News is one of the most popular news websites in the United States with about 150 million unique monthly visitors. Google News is available in 127 countries globally covering 65 different languages.

Google News was launched in 2002 in its beta version. Its founder Krishna Bharat was a Google employee who joined the company in 1999. Bharat left Google in 2015 but rejoined Google in 2019 as a distinguished research scientist. In the wake of the September 11, 2001, terrorist attacks in the United States, Bharat attempted to develop an automated news aggregator that could crawl and aggregate news across different news sources. Bharat told people who interviewed him that this idea was inspired by his experience and observation during 9/11 when he found people were not able to get news about the attacks from different perspectives. He and his team first tested an internal version inside Google. After the success of the

internal version, Google rolled out Google News in its beta version about 1 year after 9/11. Google News was out of beta in 2006. Now Google News has become one of the earliest and most long-standing Google products.

Google News provides news organized in a range of news sections, such as U.S. news, World, Business, Technology, Entertainment, Sports, Science, and Health news. Google News has experienced several redesigns since its launch. Two major redesigns occurred in 2010 and 2017. In 2018, Google announced the new, AI-powered Google News, which uses real-time artificial intellectual and machine learning technologies to organize news. In that year, Google also introduced its new Google News mobile app that merged and replaced old apps such as Google Play Newsstand and Google News & Weather.

The Google News layout looks very different from the way it appeared when the site first launched in 2002. For each news section, there are story cards that hold related news stories about certain news topics. Users can click on the news headlines, which will lead them to the original news story. Users can also choose to go to the news website that publishes the given news story, share a news story via Facebook and Twitter, or save the news story for later. Google News also has a search function that allows users to search news topics, locations, and sources. In addition to the standard news sections, Google News also has features such as “Your local news,” which aggregates news from local news outlets depending on users’ geographic information; “Fact check,” which puts together a small group of fact checking pieces from news organizations and fact checking websites; and personalization features such as “For you,” which recommends news for users; “Following,” which allows users to follow certain news topics, locations, or sources; and “Saved searches,” which can save users’ search history. These features require users to log in to their Google accounts to get personalized news based on users’ preferences and behavior patterns.

What and how news is displayed on Google News is determined by Google’s own algorithms. Once news is automatically collected across different news sources worldwide, it is input into Google’s algorithm system as raw data. News is then labeled and clustered based on various

predefined features. Google algorithms score news items based on different criteria and formulas, and rank the news in certain orders. Google and other large tech companies’ algorithms are very complex systems. Since tech companies often keep their algorithms secret, algorithms are considered a black box, meaning that the public or other outside parties are not able to scrutinize how these algorithms are designed and made to function. Given that algorithms are powerful in determining what information the public is exposed to, some scholars argue that in the digital age, large tech companies such as Google are able to share news media’s gatekeeping role through algorithmic gatekeeping.

While Google claims Google News is a free of charge and ad-free news aggregation service, observers pointed out that the news aggregator might not make money on its own, but benefits Google in various nonmonetary ways, such as traffic and search. Google’s then vice president Marissa Mayer estimated in 2008 that Google News brought Google \$100 million in revenue, about 0.7% of Google’s total revenue in that year. Based on this claim, in 2019, the News Media Alliance, an organization that represents over 2,000 American newspapers, released a study estimating that Google made \$4.7 billion from the news industry in 2018. While critics held that the study’s methodology was flawed as the figure was an extrapolation based on Mayer’s comment in 2008, the study has been cited in support of legislation proposed in the U.S. House to allow news publishers a 4-year antitrust exemption to collectively negotiate with dominant platforms regarding how their content may be distributed.

Google and Copyright

How Google manages news through its news aggregator has triggered disputes between Google News and news publishers in different parts of the world. Many of these disputes focused on copyright. In its early history, Google crawled across the web to get news without having to pay news publishers. On Google News, Google displayed at least three elements of the news for each news story: news headline, news photo, and a short paragraph of news snippet.

Google’s news aggregation service concerned many news publishers. In the United Kingdom, for

example, Rupert Murdoch, the founder of News Corp, publicly accused Google and other technology companies of stealing from news publishers and profiting from their content without compensating publishers fairly. In 2010, News International, News Corp's UK subsidiary, blocked Google and Google News from indexing content of its newspapers. But given Google's power in determining news media's online visibility, the block only lasted for a short period of time. Ten years later, in January 2020, Murdoch's News Corp launched its own news aggregation service, Knewz, to compete with Google. In 2021, Google reached an agreement with News Corp. under which it will pay to distribute the company's news articles.

Google News Initiatives

In addition to Google News, Google, since the second half of the 2010s, has launched a series of initiatives worldwide to develop its news business. These initiatives are under the umbrella Google News Initiative (GNI). In March 2018, Google announced that GNI would invest \$300 million over 3 years aiming at, according to the GNI website, "building a stronger future for journalism." GNI works with news media in three ways through Google products, partnership, and programs. Google claims that its products address many challenges in the news industry in the digital age, including content distribution, revenue growth, data and infrastructure management, and reporting; and it encourages news organizations to use Google products to grow their digital businesses. In addition, Google builds partnership with the broader journalism community, including news organizations, publisher associations, journalism research organizations, and more.

Another important approach that GNI used to expand its partnership network is to offer various programs in the form of training workshops, online courses, fellowships, and awards. GNI has also developed a university network of over 200 universities around the world, through which Google is able to work with partner journalism schools and provide Google training to journalism educators. As of 2019, these training, fellowship, and university networks covered the United States, Europe, Asia, Africa, and Australia. Some

observers saw GNI as Google's public relations effort to sweeten its relationship with the news industry. In the aftermath of the disputes between Google and European news publishers, for example, Google, through its Digital News Initiative, invested 150 million Euros from 2016 to 2019 to fund projects for digital news innovation in 30 European countries.

GOVERNMENT, FEDERAL, U.S., COVERAGE OF

The press has long been dubbed the “Fourth Estate” of U.S. government for the active role the media play in informing the electorate, but also in holding institutions and those of influence and power accountable to the people. In the spirit of watchdog journalism, news outlets are charged with keeping the federal government honest and transparent.

The ever-changing news landscape continues to evolve, bringing new challenges to legacy news outlets and introducing new digital platforms used by political elites to communicate their agendas and policies, but also by journalists as a means of information gathering and as a means of disseminating news. Nonetheless, coverage of the federal government continues to be shaped by mainstream news outlets with national influence: newspapers (such as *The New York Times*, *The Washington Post*, *The Wall Street Journal*), network television news, cable news, news magazines, public television and radio, and political talk radio. In addition, specialized news outlets such as The Hill, Politico, Roll Call, and Congressional Quarterly contribute to national coverage of the beltway. Emerging digital news sources also play a role in covering the federal government and influencing the national discourse, including Vox, BuzzFeed, and the HuffPost. Political blogs such as

the liberal Daily Kos and the conservative Drudge Report, which cemented its credibility by breaking President Clinton’s Monica Lewinsky scandal in 1998, also play a role in informing the public and shaping the national conversation.

In 2020, many of the tried and true news norms and routines persist. For example, the U.S. news media continue to gravitate to conflict-driven coverage of the federal government; the tone of coverage continues to skew negative. This is especially evident in the adversarial relationship President Trump cultivated with the national news media. Second, U.S. news is more focused on domestic policy than foreign policy, and international events that hold direct implications for United States interests are more likely to receive coverage. Third, the emphasis on “official sources” in news coverage of the federal government persists, especially on matters pertaining to foreign policy. Fourth, journalists often emphasize the gamesmanship of politics, meaning policy is often conveyed to the public through a “game-frame” focused on which political elites and which parties are “winning” on a particular issue. These strategic narratives of political coverage are especially pervasive as financial constraints present challenges to covering the government, and as newsrooms become more attentive to audience metrics and audience retention. This entry examines U.S. government media coverage of the White House, Congress, and Courts. It also examines the impact of this coverage on public opinion.

The White House

Of the three branches of government, the executive branch is covered most extensively by the national news media. The most visible in U.S. politics is the president and key members of their administration, including the vice president and secretary of state. The relationship between the White House and the press corps has historically been a tenuous one, but also a reciprocal one.

Information flow has traditionally channeled through the communications staff, the press secretary, the White House briefing room, and routine press conferences. Although approximately 8,000 media personnel hold accredited press access, press conferences are typically attended by a few

dozen seasoned journalists; the White House briefing room holds up to 49 reporters. Since 2004, some bloggers have been able to obtain press credentials to cover various facets of the federal government. Reporters working the White House beat typically obtain information through press releases, press conferences, media briefings, leaks, and working various sources within the beat. Social media has also emerged as a dominant source of White House information. President Obama first utilized social media platforms to break policy news. For example, in 2015 his administration rolled out a paid family and sick leave policy on LinkedIn in efforts to reach working parents. Perhaps no president has relied as heavily on social media to disseminate White House information than President Trump, whose prolific use of Twitter has circumvented more traditional avenues of reaching the electorate. Journalists have treated presidential tweets as newsworthy; and President Trump has responded to mainstream media coverage—often with disdain—by taking to Twitter.

Despite the adversarial relationship between President Trump and political journalists, some critics contend that journalists are too cozy with Washington insiders to effectively serve as watchdogs of the federal government. James Fallows has suggested that journalists have more in common with the political elites they cover than the public they're serving. Others argue that the tone of reporting is unnecessarily antagonistic. Nonetheless, the research has shown that coverage often skews negative in tone; however, journalists are trained to treat conflict as newsworthy. The binary political system of the U.S. lends itself to no shortage of conflict and polarization, and President Trump has often embraced or incited conflict through his policies and rhetoric. Given that news is also event-driven, scandals within the White House and a polarized 2020 impeachment of President Trump underscore the somewhat hostile relationship between the press and the president. Nonetheless, effectively fulfilling the watchdog role of the press often means relentless and unabashed pursuit of truth.

News reporting of the White House provides a public service in keeping the electorate informed, but also keeping the president apprised of public

opinion and public priorities. Effective coverage of the White House is a necessary part of maintaining a healthy representative democracy. The news media provide an important platform for the White House to communicate policy, and advance agendas. In turn, political journalists help to make the presidency more transparent and more honest, holding the office accountable to the public.

Congress

Congressional coverage is often more complicated than the presidency. The grunt work of policymaking takes shape in the U.S. House of Representatives and the Senate. Nonetheless, the Congress typically generates less news coverage than the presidency. Coverage of Congress is a task shared by both national and local news outlets; however, some members of Congress receive little to no attention from national outlets.

The 100-seat Senate generally receives more news attention than the House, which has 435 voting members. Party leadership and those chairing high-profile committees are more likely to make the news. Congressional members who generate conflict within their parties also attract news attention, as journalists respond to conflict within their beat and the novelty of those who vote against their party interests. Senior members of Congress, especially those with active legislative records, often hold more influence and generate more news coverage. This is also true for moderate-leaning members who, at times, vote against the wishes of their political party. For example, Senator Susan Collins (R-ME) and late Senator John McCain (R-AZ) had long been considered a moderate courted by members on both sides of the aisle. Freshmen congressional members who are novel in some way (through social identity, youth, or their path to politics) may also generate news. Members of Congress who adopt populist rhetoric and or positions, and look to move their political party ideologically can also be adept at generating headlines. This is evident in the success Alexandria Ocasio-Cortez (D-NY) has had in generating news attention. Congressional members are more consistently covered by the local media within their home state and the local media within the districts they represent. Those local news

outlets are more likely to have a better understanding of the issues and policies affecting the constituencies of congressional members.

National news coverage of Congressional policy has been uneven at best and noticeably absent, at worst. Journalists working the Hill acquire information from news briefings, press releases, building a rapport with sources, and through social media. Although the news media devote more attention to domestic policy than foreign policy, policy news is often delivered through a “game-frame” that is focused on which policy-makers and political party are “winning” on a particular legislative issue. Such coverage is concerned more with the strategic implications of the legislative actions of Congress over the nuts and bolts of the policies. For example, coverage of health care reform focused attention on the infighting between the two parties and what the Affordable Care Act signaled for President Obama’s legacy and his political capital. Game-frame coverage seems amplified by interpretive cable news programs that deliver information through an often biased, or partisan, lens. Even in an era of 24-hour news, news coverage of Congress has been light on policy specifics—a trend also attributed to market demands and audience preferences.

The Courts and Beyond

The third branch of the federal government, the judicial branch, typically receives far less coverage than the executive and legislative branches. The way in which the courts conduct business and the legal expertise required to effectively cover the judicial branch both explain why the news media have historically devoted less coverage to the courts. As such, the public has often held more respect for and trust in the judicial branch; however, research shows that as the visibility of U.S. Supreme Court justices increases, public trust in the Court has begun to decline (mirroring trends for other federal institutions). Nonetheless, news coverage of the courts continues to lag behind coverage of Congress and the White House.

For one, the U.S. Supreme Court deliberates behind closed doors. The highest court in the land is shrouded in secrecy, and provides little access to the press. The Supreme Court does not hold news

conferences and the nine justices rarely grant media access. While the press is not privy to the deliberative process of the Supreme Court, court opinions—both majority and dissenting—do generate news. Newsrooms also devote fewer resources to covering the judicial branch; only a few dozen journalists are assigned to the U.S. Supreme Court. In addition, few journalists hold the legal expertise to effectively cover the judicial branch and effectively synthesize legal jargon for a general news audience. But given that journalists are trained to follow and cover conflict, the courts still generate national news.

U.S. Supreme Court cases that are highly controversial or split among the justices generate more coverage due to their inherent conflict. For example, the 2010 *Citizens United v. Federal Election Commission* case generated considerable coverage due to the polarization of the issue. Conservatives argued that the courts were correct in affirming money as a protected speech, while liberals suggested the decision placed democracy for sale. Game-framed news coverage was prevalent in news attention to the 2012 U.S. Supreme Court’s narrow decision to uphold individual insurance mandates stipulated in President Obama’s Affordable Care Act. Landmark social issues can also generate considerable news. In 2015, extensive coverage was devoted to the Court’s impending decision on same-sex marriage; the divisive court voted 5-4 that states must grant and recognize marriages to same-sex couples. In short, split and controversial court decisions are more likely to generate substantial news. The decisions made by the 94 district courts and 13 circuit courts may also generate news, especially if a decision sets unusual precedent or is likely to be followed with an appeal.

Also noteworthy are the lengthy and, often polarizing, appointment processes and subsequent congressional hearings for Supreme Court justices. An appointment of a new justice is newsworthy, but especially so when that appointment is controversial. For example, the sexual assault allegations made by Christine Blasey Ford during Brett Kavanaugh’s 2018 hearings dominated the mainstream news agenda, particularly cable news, and ignited a firestorm of commentary on social media. With the increased polarization in the political climate, high-profile judicial appointments are likely to

generate controversy and heightened news scrutiny.

Lastly, news coverage must also hold various departments and arms of the federal government accountable. Also under the purview of the Fourth Estate are the Pentagon, the Federal Bureau of Investigation (FBI), the Justice Department, the Environmental Protection Agency (EPA), the Internal Revenue Service (IRS), and the Department of Education, among several others. Coverage of these departments are often uneven and are largely event driven. For example, stringent immigration policies under the first term of President Trump placed new media attention on U.S. Immigration and Customs Enforcement (ICE) and immigration policies. While some journalists are assigned these various department beats, widespread national news attention remains inconsistent as newsrooms grapple with reduced resources.

Effects on Public Opinion

Despite changes to the news landscape and disruptions to traditional platforms of information, the news media continue to play an influential role in informing public opinion. Even in a more fragmented information environment, legacy news outlets still exert influence through its agenda-setting powers. In other words, government policies and issues emphasized by mainstream news still convey their importance to the public, although this influence on public opinion may become more indirect as people turn to social media for news.

News narratives also have a hand in shaping public attitudes by framing events and issues. These frames can affect how the public evaluates public officials and various federal offices. News frames, which emphasizes certain characteristics (or attributes) of an event over others, help to build the political agenda and can influence the behavior of legislators or shape public opinion. This power to shape public opinion was underscored when news anchor Walter Cronkite began questioning the Vietnam War. The power of the national press corps can work in either direction—it can facilitate public opposition to policy or rally support for it. For example, the news media was later criticized for echoing the frames of political elites in its coverage of the War in Iraq following

the attacks on September 11, 2001. In a related example, the news amplified the homeland security frames of the White House in covering President George W. Bush's PATRIOT Act in 2001, neglecting the civil liberties frames used by the legislation's opposition (subsequently resulting in a 98-1 vote in the U.S. Senate).

As news organizations continue to grapple with consolidation in the news business, they must navigate their political beats with fewer resources and with less public support. The erosion of public trust in the institution of news has helped create a climate where fake news has a market and disinformation moves with ease through the online environment. What is more, Pew Research Center reported that in 2018 those using social media as a primary source of news and information (20%) outpaced those utilizing print newspapers as a primary source (16%). Therefore, journalists work tirelessly to hold federal institutions accountable in environments that are increasingly hostile to news professionals and as they serve a public that is less willing to support traditional news platforms financially and less willing to put its faith in the Fourth Estate.

GOVERNMENT, STATE, U.S., COVERAGE OF

Journalistic coverage of state governments in the United States encompasses a broad spectrum of reporting on legislative, executive, and judicial affairs; civic and public safety issues; and elections. Like reporting on local governments, statehouse reporting has important implications for the effective and transparent function of government, for responsible use of public funds, for public information, and for public debates about issues and legislation. While newspapers lead in the staffing of statehouse press corps, changes in the news industry have led to a decline of dedicated journalists reporting on state governments—a gap into which nontraditional media, particularly public and nonprofit organizations, have stepped in the 2010s and early 2020s to provide focused coverage.

This entry explores the scope of reporting on state government, the status of statehouse reporting by traditional media, the growth of nontraditional and nonprofit reporting, and the corollary role of public information offices working to

facilitate media coverage on behalf of state-level executive, legislative, and judicial entities.

Duty of the Media in Coverage of State Government

Through power granted by the Constitution, state governments have jurisdiction over matters not specifically allocated to the federal government. This power includes intrastate commerce, the conduct of elections, and the administration of public health, safety, and welfare programs. Like the federal government, state governments can make and enforce laws, charter financial institutions and corporations, collect taxes, and regulate property. State executive departments collaborate with federal agencies in the administration of federally funded programs encompassing public welfare, education, transportation, safety and emergency response, law enforcement and corrections, and more.

Considering the direct and important impact of state governments on the lives of those within their jurisdiction, journalists play an important role in serving citizens when they report on the conduct of elected officials, the responsible functioning of state agencies and administrators, the transparent use of taxpayer dollars, public policy debates, and elections. The media thereby fulfills a number of traditional functions, specifically serving as a public watchdog, investigating wrongdoing, and ensuring government accountability. These functions are supported by sunshine laws in every state, mandating most government proceedings and records are accessible, much like the Freedom of Information Act at the federal level.

Journalists report on the wide-ranging responsibilities of state governments by investigating the many offices, agencies, and individuals that comprise them, a complex ecosystem of budgets, power, and jurisdiction. Coverage may begin with the governor's office and the executive branch, typically consisting of a lieutenant governor and senior office-holders, such as a secretary of state, attorney general, and others. The news media may also cover the executive departments that fall under the governor's office, including areas such as agriculture, commerce, environment, and health, with multiple agencies within each department. Coverage of state legislatures, which in all

cases but Nebraska comprise two houses, is highly demanding, as sessions may last several months to a year, as legislation and issues are actively debated, and as dozens to several hundred members formulate opinions, take votes, and pursue political agendas. Members of the media must be properly credentialed for access to legislative sessions. In some states, such as Alabama and Tennessee, access to the chambers is guaranteed by the state constitution. In others, the media may be allowed by tradition into specified areas, such as a press gallery or designated seating on the chamber floor. Where or when the media is not allowed into legislative chambers, alternate accommodations may be provided in onsite press rooms with audio or video feeds. The news media may also cover the state judiciary, comprised of courts at multiple levels, and their dispensation of civil and criminal cases.

State Government Coverage by Traditional Media

Newspapers have long led the coverage of state government with full-time or part-time reporters assigned to legislative affairs, executive offices, and emerging issues. Since the 19th century, the press has recognized the unique responsibility and discrete role of statehouse reporters, with several states forming Legislative Correspondents Associations (LCAs). New York's LCA, founded in 1890, Ohio's LCA established in 1893, and Pennsylvania's in 1895 are among the oldest in the country, chartered during a period of active professionalization of the industry as a whole. Representing journalists from newspaper, radio, television, digital, and wire service organizations, the Massachusetts State House Press Association has been accrediting and representing reporters in the Commonwealth since 1909, through power granted by the state legislature.

Where staffing and funding levels permit, reporters may be assigned to a state government entity or to a legislative or political beat. Sometimes reporters specialize not by governmental division but by news topic area—health, education, or environment, for example. Larger newspapers, especially those based in a capital city, may have a dedicated statehouse bureau or staff. The *Sacramento Bee's* Capitol Bureau, as one example,

has multiple reporters who cover the statehouse, which conveniently lies less than a mile from the newsroom. The Minneapolis *Star Tribune* typically has four individuals devoted to news from the Minnesota State Capitol. Highly circulating newspapers not located in the state capital may have dedicated reporters as well, but typically fewer, with the *New York Post*, as of 2021, maintaining one full-time and several part-time or general-assignment reporters in Albany, while *The Wall Street Journal*, with a different scope of coverage, employed one full-time capital reporter as of 2021. Midsize newspapers located in a capital region, such as the *Olympian* in Olympia, Washington, and the daily *State Journal* in Frankfort, Kentucky, may feature regular state government reporting, even though, overall, smaller newspapers are less likely to have journalists on duty at the statehouse.

For those media outlets that do not or cannot maintain their own regular statehouse reporters, national or state-level wire services provide regular coverage of state governments. The Associated Press maintains statehouse reporters in all 50 states and has actively recruited for these positions in recent years, as part of a collaboration with the nonprofit Report for America, a national service program for journalists. Gannett, the media holding company that owns *USA Today*, has expanded its statehouse reporting with capitol bureaus in multiple states. Massachusetts offers an example of a state-level news service, the State House News Service, a privately owned company that has covered state government since 1894.

While newspapers still deliver the largest share of statehouse reporting, television and radio also provide news from the halls of government. Television stations are more likely to support dedicated reporters within a capitol bureau when they lie within a capital region such as Raleigh, North Carolina, or Topeka, Kansas. While media consolidation may challenge the extent of local news reporting, some broadcasting companies are taking steps to ensure statehouse coverage. In Missouri, for example, the Nexstar Media Group announced the 2020 launch of a Jefferson City news bureau, to be housed inside the Missouri capitol building, providing television broadcasts and digital news to audiences across the state.

Public and state-funded television and radio stations can be important sources of news from state governments as well, with some offering original news programming in addition to livestreaming of legislative sessions. South Dakota Public Broadcasting, as one example, streams legislative and committee sessions, but also provides reporting on health care, education, and other public policy issues. In California, Capital Public Radio has a state government beat and public affairs programming that explores legislative policy and politics. Funded by the state's Broadcast Educational Media Commission, Ohio's Statehouse News Bureau provides written and multimedia reporting on legislative issues and events of public interest to public television and radio stations, including a weekly radio news program, "The State of Ohio." New Hampshire, Missouri, and Illinois are additional states where NPR-affiliated public radio stations have at least one long-term, dedicated statehouse editor or reporter.

Because of the importance and complexity of statehouse reporting, journalists are most effective when they have a deep and long-standing understanding of the issues. To prepare young reporters for these roles, some journalism schools offer one or more courses focusing on the field to strengthen students' ability to research and analyze state-level topics. Some programs include on-site reporting in statehouses or from government agencies. Courses may also explore specialized breaking news, documentary, and investigative reporting skills in areas pertaining to state government, such as public policy, health, environment, politics, and elections.

Decline in Statehouse Reporting by Traditional Media and Rise of Nontraditional Media

Studies in the 21st century indicate a slide in the number of reporters assigned to cover state government since the late 1990s. The 2014 study by the Pew Research Center, the most comprehensive profile of the statehouse corps of reporters, found the total number of statehouse reporters had declined by 35% since 2003, and that those remaining were more likely to be part-time and less experienced, leaving a knowledge gap that could impact the quality and depth of reporting.

The research also found that more than two-thirds of U.S. newspapers and more than four-fifths of television news stations did not assign reporters to cover state government at all, leaving regional and local media to rely on wire service stories and often on content provided by state public affairs staff. Such sources mean not only that news coverage will be less localized but also that it may lack the nonpolitical, investigative impulse that upholds government accountability.

Moving into this space are nontraditional and nonprofit news media. This category includes organizations spawned by traditional media outlets as well as digital-native platforms, with many characterized as self-funded or nonprofit. Citizens in many states, including Texas, Illinois, and Georgia, now benefit from multiple independent news organizations that provide journalistic expertise and often award-winning content from their state capitals. While some of these platforms lean slightly or strongly toward an ideological perspective, others strive to present balanced news coverage. In 2020, for example, multiple leading media organizations in Pennsylvania, including the *Philadelphia Inquirer* and Pittsburgh's *TribLIVE*, teamed up to form SpotlightPA, an award-winning newsroom employing a dozen investigative reporters and editors in Harrisburg, the state capital. SpotlightPA operates beside other watchdog media in the Commonwealth, such as the digital-only *Pennsylvania Capital-Star* and the longstanding Pennsylvania Cable Network, which touts itself as the nation's largest privately funded public affairs broadcast network. The *Capital-Star*, in fact, is part of States Newsroom, a syndicated network of affiliated and partnering news organizations in an expanding field of more than 20 states. Yet many nontraditional media reporting on state government are independent, as is the comprehensive *Nevada Independent* website; the digital-first *Texas Tribune*, founded in 2009, which boasts the largest statehouse bureau in the nation; and the Sacramento-based CalMatters, which provides statehouse coverage spanning reporting, data visualization, and multimedia content. Also providing strong statehouse reporting is *Capitol News Illinois*, a nonprofit initiative from the Illinois Press Foundation. Funding for such initiatives comes from public and private grants, donations, and subscriptions.

The Role of Public Information Offices

Although the relationship has often been strained, the media and state governments share a common duty to promote an informed citizenry and have long worked cooperatively to meet this goal. Communication staff housed in the governor's office and executive branch agencies, in state legislative bodies and the offices of individual legislators, and in the state judiciary use a spectrum of public relations tactics to support the media in their reporting duties. These tactics may include online newsrooms, news releases and media advisories, backgrounders and policy briefs, multimedia content, press conferences, and more. But as the number of statehouse reporters has declined in the 21st century, and those remaining are less likely to be full-time or long-term, government public affairs officials occupy a more prominent role in providing content to journalists—and increasingly, circumventing the media altogether, by providing news directly to citizens. With this expanded control over the flow of information, public affairs staff take on some proportion of the gatekeeping and agenda-setting roles traditionally ascribed to the media.

A press secretary or communication director typically leads the governor's office in its efforts to engage the media. Through a website or direct request, journalists can acquire an array of prepared news and announcements related to state budget and economic data, staffing and appointments, legislation, and current events, along with policy statements, speech transcripts, and proclamations. Content may be released as often as several times a day. In times of crisis, governors' offices may be a central point of information for media and the public, as in 2020 during the COVID-19 pandemic, when state governors such as Andrew Cuomo of New York and Mike DeWine of Ohio held daily press briefings and issued regular public health notices. Officials and agencies within state executive branches, likewise, are also supported by communication or public affairs offices that oversee a regular flow of news and information for the use of the media as well as the public.

State legislators and legislatures seek to promote media coverage of legislative action and

issues by providing a similar range of resources that identify and promote story ideas. Through their communication staff, individual legislators may participate in interviews or press conferences, provide news releases and policy statements, enable access to recorded legislative sessions, develop multimedia content, and more. Legislative bodies in each state, similarly, may maintain a director or office of communication to provide news content, but a corollary role is to facilitate the participation of media in legislative sessions by providing resources and protocols for reporters. The Montana State Legislature's communication office, as one example, provides a comprehensive website that provides information on members and legislation, as well as targeted guidelines for journalists, including credentialing, logistics such as parking and capitol workspaces, links to resources, and more. State legislative party caucuses may also provide media resources, or generate more politically charged, issues-oriented content in the form of blogs and podcasts.

Although public affairs staff may not be as visible in the judicial as in the executive and legislative branches of state governments, public affairs staff in the state judiciary not only provide public resources but also issue news, resources, and guidelines for the media. In Nevada and many other states, the media can find opinions, policies, hearing schedules, and even press releases online. In states such as Pennsylvania and Nebraska, media coordinators may be found at the county, district, and state levels, and in states such as Michigan, public information offices actively manage public inquiries and media relations for the state supreme court. With traditional media often assigning coverage of judicial news to general assignment reporters, some states are now providing print and digital educational resources to instruct reporters on legal issues, terminology, and procedures.

Looking to report on state executive, legislative, or judicial affairs, members of the media thus will find plenty of resources thanks to state public affairs staff. But while story ideas and supporting material are indeed at-the-ready, this content cannot replace the independent scrutiny, thorough investigation, and, ultimately, public accountability that results from a robust news media assigned to the statehouse.

Future Concerns

As the media landscape continues to shift, there is growing recognition of the urgent need for regular, objective, and expert reporting on state governments. Both traditional and nontraditional media organizations are responding by finding creative ways to fund and deliver meaningful content in the midst of widespread industry cutbacks. Yet new technologies, new platforms, and new collaborations are spurring a new era of statehouse reporting. And while state public affairs offices maintain a constant flow of information to the media and the public, there is reason to expect continued expansion of nontraditional media as important players in this field, protecting journalism that serves the public interest, promotes engagement with the political process, and holds state agencies and officials accountable.

GRAHAM, KATHARINE

Katharine Meyer Graham (1917–2001) was the publisher of *The Washington Post* from 1969 to 1979 and served in a leadership capacity at that newspaper for nearly 30 years, from 1963 to 1991. Her tenure included taking the Washington Post Company public, the *Post*'s publication of the Pentagon Papers, and coverage of the Watergate break-in and President Richard Nixon's criminal involvement. In 1998, she won a Pulitzer Prize for her best-selling memoir, *Personal History*. This entry traces the course of her life from her youth, her subsequent marriage to Philip Graham, through her years at the *Post* and her retirement; the entry concludes with a brief overview of her memoir and of the 2005 biography of Graham by Robin Gerber.

Early Life and Marriage

Graham was born in 1917 in New York City, the fourth child of the wealthy and cosmopolitan Eugene and Agnes Meyer. Eugene was a prominent financier who held several government positions during and after World War I, moving

between New York and Washington. Agnes had been a reporter at the *New York Sun* early in her career and continued to write, lecture, and lobby for political causes throughout her life. The Meyers had four girls and one boy, and Katharine was said to be the stoic Eugene's favorite, the one most like him. She also suffered as the continual butt of her mother's jokes about her supposedly plain appearance and intellectual deficits, a teasing that she and others believed affected her self-confidence for years.

In 1933, while Graham was attending Madeira, a private girls' school in Virginia, her father bought the struggling *Washington Post* at a bankruptcy auction and settled permanently in Washington. The newspaper had been founded in 1877 and had had several owners. Meyer intended for the paper to become politically independent and journalistically professional. He began to achieve that goal in his tenure as publisher, from 1933 to 1946, and the *Post* continued to prosper under the leadership of his son-in-law and daughter, growing into a nationally important newspaper.

After graduating from Madeira, where Graham was involved in student government as well as the newspaper, she attended the women's college Vassar in upstate New York for 2 years. She grew restless at the small liberal arts college and transferred in her junior year to the University of Chicago, from which she graduated in 1938. She had worked on newspapers in high school and in college, and after her college graduation took a job as a reporter at the *San Francisco News*. After a few months, her father convinced her to return to Washington, DC, where she joined him at the *Post* as part of the editorial page. There she edited Letters to the Editor, proofread, and wrote editorials. It seemed for a short time that she might be groomed as her father's successor as the publisher of the *Post*, since her brother—the most likely candidate based on his sex—was to become a doctor. Graham's future at the newspaper quickly changed when she married a man whose charm, energy, and ambition made him the family's choice to take over stewardship of *The Washington Post*.

Philip L. Graham, whom Graham married in 1940, was a Harvard Law School graduate, originally from Florida, and at the time of his marriage had been hired to clerk for the liberal Supreme Court Justice Felix Frankfurter. The couple lived

near Georgetown, where they enjoyed an ever-widening circle of professional and social friends who helped make their home a center of entertainment, gossip, and liberal intellectual life in the capital. From 1943 to 1952, the Grahams had four children: Elizabeth, known as *Lally*; Donald, whom the family decided would succeed his father at the *Post*; William; and Stephen. During this time, Graham was primarily a wife, mother, and homemaker. Her husband served in the Army Air Corps during World War II and in 1946 took over as the publisher of *The Washington Post* when his father-in-law, Meyer, became the first president of the newly established World Bank. Meyer served for 6 months, and when he returned to the *Post* he did so as chairman of the board, while Phil stayed on as publisher. The Meyers, especially Agnes, doted on their son-in-law, even arranging for him to have more of the voting stock of the family company than did his wife.

From 1940 to 1963, Graham supported her husband and kept as quiet as possible his increasingly erratic behavior and drinking, diagnosed as manic-depressive illness (now called *bipolar disorder*). Graham remained in the background—an active helpmeet to her husband and Washington hostess but inactive in the running of the newspaper or its acquisitions. By 1963, under Phil Graham's leadership, those acquisitions included the *Post's* rival newspaper, the *Washington Times-Herald*; the local CBS-affiliated radio station, WTOP; *Newsweek* magazine; television stations in Florida; and a joint news service with the *Los Angeles Times*. In August 1963, Phil Graham, after years struggling with mental illness and while conducting an indiscreet affair with a one-time *Newsweek* employee to whom he tried to transfer his ownership of the *Post*, shot and killed himself at the Grahams' country home in Virginia.

Leadership of The Washington Post

Graham spoke often of feeling unprepared for her leadership role at *The Washington Post* in the wake of these events but nevertheless decided to take over as the chief executive of the company until her son, Donald, then at Harvard College, could succeed his late father. In a few years' time, it was clear that Graham had become more than a

placeholder for her son, as she took over the Washington Post Company in her own right. In 1969, she took the title of publisher as well as president and embraced her role as an influential player in Washington media and politics.

One of her most significant early actions as president of the *Post* was hiring Benjamin C. Bradlee in 1965 as she worked to put in her own management team. Bradlee had briefly worked for *The Washington Post* in the late 1940s, and in 1965 he was at the Washington bureau of its subsidiary *Newsweek*. Graham and Bradlee edged out the two men who had run the newspaper since World War II, Alfred Friendly and J. Russell Wiggins, and Bradlee ran the newsroom as his own for the next 26 years. In her mission to grow the profits as well as the imprimatur of *The Washington Post*, Graham continued the strategy of making acquisitions that her late husband had pursued, most significantly, in 1966, buying a one-third stake in the influential *International Herald Tribune*.

Graham interfered little with the news and editorial judgment of her employees at *The Washington Post*, instead letting them pursue stories as they wished. Along with her closest business partner, Frederick "Fritz" Beebe, the chairman of the board of the Washington Post Company, she instead focused on growing their business and making it profitable. She also ran interference with the public officials—including Presidents Lyndon Johnson and Richard Nixon—who were frequently angry at the *Post's* news coverage. On June 15, 1971, Graham took the Washington Post Company public, making it answerable for the first time to Wall Street shareholders. Worries about the newspaper's finances and its new status as a public company weighed on her as she and the staff of *The Washington Post* decided what to do in the publication of the Pentagon Papers, the Defense Department's classified history of the war in Vietnam. The *New York Times* had secretly acquired the papers and on June 13, 1971, had begun printing their series of articles and classified documents, until a government injunction prevented them from further publication. The *Post* meanwhile acquired its own copy of the Pentagon Papers, as had other newspapers, and needed to decide whether to risk its own injunction and legal battle. On June 18, Graham and her staff decided

to publish the classified documents and, after two issues, were enjoined, as well. The resultant Supreme Court decision in *New York Times Co. v. United States*, decided together with *United States v. Washington Post Co.*, held that the government had not overcome the “heavy presumption against” prior restraint of the press, and that publication of the Pentagon Papers could continue. The move did not hurt the paper financially, and Graham and the *Post* leadership felt vindicated by the Supreme Court’s decision, while also feeling that the Court did not go far enough in ensuring future press freedom.

Prior to the Pentagon Papers publication and as far back as his time in Congress and as vice president in the 1950s, Nixon had had poor relations with the press, in general, and with the *Washington Post*, in particular. When Graham’s newsroom decided to pursue the story of the June 1972 Watergate break-in and the White House’s connection to it, she refrained from interfering. She remained committed to her newsroom’s independence and the public service journalism her father had valued, despite pressure from the White House to stop the relentless coverage of Nixon’s wrongdoing. Pressure came in the form of a Federal Communications Commission investigation into the *Post*’s ownership of two Florida television stations, as well as barely veiled threats that Graham received through acquaintances in the administration, including Henry Kissinger, with whom Graham remained friends even after Watergate. The *Post*’s coverage of Watergate earned the newspaper a 1973 Pulitzer Prize for public service journalism as well as national fame through the publication of *All the President’s Men*, by the two *Post* reporters who had covered the story, Carl Bernstein and Bob Woodward, and through the 1976 Robert Redford movie of the same name, starring Redford and Dustin Hoffman as Woodward and Bernstein. Graham was not featured as a character in the film, reportedly a result of her at one point trying to stop Redford from making the movie after having initially agreed to cooperate. Graham was eventually preserved in celluloid in 2017 in *The Post*, a movie about the Pentagon Papers in which Meryl Streep portrayed Graham.

Criticisms and Reflections on Her Own Life

Although Graham served as a role model for young women in business and media and achieved several “firsts”—including becoming the first female director elected to the board of the Associated Press and the first female chair of the American Newspaper Publishers Association—she has been criticized, and was later self-critical, for not being supportive enough of women’s workplace equality. In her memoir, written in the 1990s, Graham acknowledged that she had attributed any difficulties involved with her work to herself as an individual and not to structural biases against women. In 1970, when women at *Newsweek*, a magazine by the Washington Post Company, sued their employer under Title VII of the Civil Rights Act, Graham declined to become involved with the negotiations.

In 1972, employees at *The Washington Post* filed suits with the Equal Employment Opportunity Commission under Title VII, this time separate suits for both sex and race discrimination. The *Post* ultimately settled those suits and put affirmative action measures in place, but Graham had been critical of employees who took legal action instead of working with management. She only later acknowledged that employees had likely tried to talk with management for years without result and that she had been shortsighted.

Another criticism of Graham was for her anti-union labor practices. To counteract an anticipated pressmen’s strike in 1975, she brought in nonunion employees that a former *Post* editor had arranged secretly to train. Although the striking pressmen from Local 6 of the Newspaper and Graphic Communications Union had damaged the printing presses before leaving, Graham arranged to have the newspaper printed at the presses of six smaller newspapers while her own presses were repaired. *The Washington Post* successfully published without the pressmen. By February 1976, management had won, the strike ended in failure, and the pressmen of the *Post* were no longer unionized. The *Post* had assured its profitability with millions of dollars in savings from labor costs, earning Graham the reputation as either a profit-seeking union buster or a shrewd businesswoman, depending on who was viewing her.

Eugene Meyer had always intended for his grandson, Donald, to take over *The Washington Post*, and in 1979, after serving at the *Post* and *Newsweek* in a variety of editorial and business positions since 1971, Donald Graham succeeded his mother as publisher of the *Washington Post*. Graham remained with the newspaper, as CEO of the Washington Post Company, until 1991.

In the 1980s and 1990s, while she stepped back from the daily running of the newspaper, Graham continued to entertain friends, colleagues, and eminences at her famous Washington dinner parties, as she had done with her husband, and as her parents had done before them. She also wrote her autobiography, personally conducting interviews with people who had been in her life and drafting the book herself over 7 years. For years, Graham had refused to cooperate with writers producing stories about her of which she had not approved, and, in the case of one unauthorized biography published in 1979, convinced the publisher to recall and destroy 20,000 copies. She apparently had objected to the author's assessment of *The Washington Post's* connections with the Central Intelligence Agency (CIA), which were not as official or nefarious as the author suggested, but which were also so deeply embedded in the Graham family's personal-professional networks as to be ethically problematic. Despite a reputation of not being transparent, Graham's *Personal History* was well-received as a surprisingly candid, introspective, and well-researched memoir that in 1998 won the Pulitzer Prize for distinguished biography or autobiography by an American author.

In 2001, at age 84, Graham died after falling and becoming unconscious at an elite media retreat in Sun Valley, Idaho. A 2005 biography by Robin Gerber tells the story of her life through the prism of her role as a business leader and CEO and is a narrowly focused but useful companion book to *Personal History*. Graham's autobiography nevertheless remains the conclusive history of her life and a fascinating account of a woman who felt herself ill-prepared for the outsized role she eventually inhabited in the media world.

GRAPHICS

Graphics, also referred to as *infographics*, are visual elements used to explain information (as in a news story) in a way that text, photos, or video alone would not be able to do. Graphics present information in a more concise, succinct way. With the launch of *USA Today* in the 1980s and the development of the Internet, graphics have become a vital part of news presentation.

In 2019, Edward Tufte, an authority on graphics history, estimated that between 4 and 10 trillion graphics were used worldwide annually. With an increasing focus on news online ("web-first"), most experts expect the overall number of news graphics, including those used in television news, to continually grow.

This entry provides an overview of the use and development of graphics for news. It describes the common elements and types of graphics, and the impact technology has had on the creation and presentation of graphics.

Graphics for News Presentation

Graphics should be easy to understand. The best graphics do not call attention to themselves, but rather become an integral part of the story they support. Those looking at a graphic should not worry about how it was put together, but focus on

the information it provides. While some interpret graphics in print media to include photographs, most media organizations make a clear distinction between the two, often having separate departments for each. Collaboration between the two is common and stories often contain both graphics and photos.

Graphics may accompany a story, or may stand alone. Reporters and/or editors usually play a key role in developing graphics, since they provide the needed information. They also decide when a story needs a graphic. Information for the graphic is rarely repeated in a story to save space. Since graphics are supposed to replace text, most present information in a visually creative way, rather than relying on extensive use of text. Most media companies hire specialists not involved in the layout or editing of a story to create graphics on a regular basis.

While illustrations can be humorous, they still need to fulfill a specific informational goal. Knowing the purpose of any graphic, then, is central, as is the data on which it is based. In recent years, data have become more widely available, through websites such as Data.gov, the federal site launched in 2009 with the aim of providing the public with more data generated by the U.S. Executive Branch. With that, the field of data journalism—using data to tell the story—has created a renewed and increased interest in the use of graphics as a way of explaining significant and complicated numbers and information in more understandable and manageable ways for the public, making the data itself an increased focus of the storytelling.

New technologies have provided a huge boost to the use of graphics in journalism, by making their creation easier, quicker, and less expensive. News outlets continue to use now-traditional tools such as Adobe Illustrator and Photoshop to create graphics. However, a number of new websites and online tools have made graphics easier to produce and more widely used recently.

Common Elements in News Graphics

Most effective graphics, whether in print or online, share five basic elements:

1. The *headline*, or *title*, provides a short, clear introduction to the graphic, calling people to

read it. Often headlines in graphics can be confusing, calling for further explanation in the graphic itself.

2. The *chatter*, or *brief*, presents additional information explaining the graphic or its reason to be. It may serve as a complement to the headline.
3. *Art* is the visual core of any graphic. It may include a pie chart, map, one or more photos, or a meld of photos and graphic features.
4. The *source* explains where the information contained in the graphic was originally acquired. This may be the name of an organization, the title of an article or book, or other sources.
5. The *credit* lists the artist and/or publication that created the graphic.

Types of Graphics

Nowadays, graphics are often split into two main types: static and interactive. Static graphics contain fixed elements that do not require reader contact. Interactive graphics, on the other hand, depend on reader input—a click, scroll or more data—in order to present statistics or other information, and may vary depending on the reader input. Whether statistic or interactive, graphics now may include animations, sound, video, or other multimedia capabilities.

There are six most common categories of graphics: maps, tables, charts, timelines, illustrations, and breakout boxes.

1. *Maps* are the most common type of journalism graphic. They help answer questions about the location of places cited in stories; the distance between places; or the geography, typography, or other spatial relationships. Maps may focus on specific subjects, such as weather or population information.
2. *Tables* provide information usually displayed in columns and rows, with headings usually running horizontally across the top, and the categories listed vertically on the left side. Tables allow readers to compare two or more subjects, and can sometimes include much text. Tables may also include photos or drawings, to help illustrate the different categories or subjects.

3. *Charts* are, in a sense, graphic tables. There are three common types of charts: fever or line, bar, and pie charts.

A fever or line chart shows one or more continuous lines connecting several points on a grid. This helps illustrate changes in quantity or amount over time. A fever chart can contain multiple lines comparing elements over time. Stock market trends are often presented using a fever chart.

Bar charts, as the name suggests, present information by using bars to compare two or more items. All bars in a graphic extend in the same direction (either vertically or horizontally) and follow the same scale, allowing ready comparison of the measures illustrated.

Pie charts demonstrate all of a given category, as well as how different subcategories make up the whole. Each subcategory is represented by a “slice” of the pie, usually separated from others by lines and the use of different colors or markings.

4. *Timelines* illustrate how a trend of events developed over time. They nearly always include some measurement of time from moments to weeks or years. Timelines are especially useful in tracing developing events and are essentially graphic chronologies.
5. *Illustrations* or drawn pictures help add information to a story in a clearer fashion than text or photographs. Cartoonists use their illustrations to make comments by enhancing a person’s physical features to playfully poke fun at—or strongly satirize—their subjects. During the 2008 U.S. presidential elections, for example, illustrations often showed Barack Obama with large ears.
6. *Breakout* boxes present information by highlighting parts of the text in an attention-grabbing way. These may include highlighted quotes, a list of questions and answers; a fact box, listing an event’s time and location; a brief biography of a person; or checklists. Page designers often create breakout boxes as they lay out a publication, with the input of editors and reporters.

Development

In modern history, many consider Williams Playfair, Scottish engineer and political economist, the father of graphics. Joseph Priestley is credited with creating the first timeline. In 1806, *The Times* of London used maps to explain how a murder took place in a victim’s mansion in 1806, marking the beginning of graphics in news media. In the United States, the first newspaper maps appeared in the 1860s, to clarify important battles during the Civil War. The *Chicago Tribune* was the first newspaper to create a graphics department, in 1974.

USA Today

The best-selling newspaper in the country, *USA Today*, brought with it a revolution in the use of graphics right from its first issue in 1982. A committee was assembled in 1980 to design prototypes for the newspaper—then code-named “NN,” for “Nation’s Newspaper.” It included Gannett CEO Al Neuharth; Ron Martin, then editor of the *News American*; future deputy managing editor of design J. Ford Huffman; and designer George Rorick, among many others. Around 30 people worked in assembling prototypes for what would become *USA Today*.

Four prototypes were presented between 1981 and 1982. When the *USA Today* was launched on September 15, 1982, it introduced several new graphic elements that American newspaper readers had not previously seen. Perhaps the most famous was the color weather map. The idea was simple: run a wide map across the page and put weather patterns in it. Artist Ray Stanczak, editor John Bodette, and J. Ford Huffman did the first *USA Today* map.

Internet Influence on Graphics

Since it became a commercial medium in 1995, the Internet has changed how graphics are used in news media. The *South Florida Sun-Sentinel* was one of the first newspapers to present graphics online. Leavett Biles, graphics director at the paper, created the multimedia graphics department. The department launched its first animated graphic online in late 1996. It was a Christmas

project for the Science page of the online edition of the newspaper, created using the Macromedia Director and Shockwave programs.

Since then, a number of new tools, including various websites launched since 2012, have been developed that allow for easily creating even more interesting and captivating graphics. Those, however, now often require graphics specialists who also know coding, in order to properly adapt the tools to their needs.

Some graphics, for example, currently include animations, whether through long videos, short animated GIFs—first introduced online in the mid-1990s, but further popularized with the advances of mobile media since 2013—or even micro-animations (small, subtle animations that highlight very specific parts of a graphic).

Whereas, in the past, graphics had to be constrained to the width of a printed page or spread, the Internet and new mobile devices such as smartphones and computer tablets now allow graphics to expand through multiple screens. A common effect currently used in many online news graphics is Parallax, a technique developed for websites in the mid-2010s, where the background of graphics scroll at a lower speed than the information and images on the foreground, creating a 3D effect for the reader.

As the technology advances, the media are expected to not only enhance their graphics in print—by using, for example, more powerful 3-D software—but also online. News graphics online often now incorporate some personalization, inviting the visitor to enter personal data. Others use the concept of “interactive discovery,” requiring the visitor to click on specific areas of the graphic to enable more information, or allowing them to interact with the graphic to tailor the information they receive. Some news outlets have started, since 2018, experimenting using virtual reality to present graphics, creating an even more immersive and interactive experience for the reader.

Still, experts in the field predict that, no matter the technology, the future of graphics will be data driven, with the data and its analysis being the cornerstone of creating the news graphics.

GUTENBERG PRESS

The phrase *Gutenberg press* signifies a 15th-century technological innovation in publishing based on the use of a printing press featuring both moveable metal type and automatic inking to create multiple copies of text in large quantities. The use of ink and type to make impressions in printing

for publication was not a new process; the Chinese had used wooden block presses to create books as early as the 8th century CE. The problem with using wooden blocks was the short lifespan of the blocks, requiring frequent replacements. In addition, most of the blocks required the ink to be replenished by hand after only a small number of impressions. The limited lifespan of the images and the slow process of inking greatly reduced the utility, as well as increased the cost, of early press printing as a means of mass distribution of reading matter. The Gutenberg press created a means of more quickly and efficiently producing quality images with a reduced cost of production using an improved mechanical process. The descendants of this form of printing press still operate today, employing a vast array of modern technological improvements for printing.

This entry traces the origins and historical development of printing and moveable type and its effects on society generally, including efforts by established social institutions to control the flow and content of information that thereby became available to an increasingly literate public. Among the more transformative effects of wider access to the Bible was the questioning of religious doctrines and practices by reformers such as the German theologian Martin Luther, leading to the Protestant Reformation. Also described are the effects of the greater abundance of information, provided by a proliferation of broadsheets and newspapers, on the growth of mercantile activity and commerce generally, as well as increased participation of the general citizenry, especially the growing middle class, in political and civic affairs that were formerly the preserve of royalty and the landowning aristocracy. Following a section describing the advent of copyright protection for authors and publishers and the development, the entry concludes with a discussion of the modern technologies that have vastly extended the reach of mass communications far beyond that of the Gutenberg press, from radio to television to the digital computer and the Internet, and the resulting acceleration of social change across the globe.

Historical Development

The estimation is that Johannes Gutenberg and his partner, Andreas Dritzehn, started using the press

circa 1436 CE in Gutenberg, Germany. European presses previously used woodblock techniques largely as an extension of printing technology developed in China before the 7th century CE. Wooden presses required that blocks be hand carved and, between impressions, hand inked, while the new Gutenberg press used a metal matrix with movable type for setting, quick interchangeability, and reuse. Gutenberg, who was trained as a goldsmith, used his knowledge of metals in designing the new press. He was the first printer to utilize an alloy composed of tin, lead, and antimony in the casting of the type. This new alloy helped produce a durable metal type that resulted in higher-quality prints even after repeated use. Gutenberg's new process used a metal press with a much longer lifespan than its wooden predecessor and incorporated a mechanical means to automatically ink the type and images before pressing on to the paper or cloth.

The use of movable type, essentially the use of elements—individual letters, words, or phrases—that could be replaced individually, was new. The movable type permitted customization and alteration of print without the need to create a completely new block. The type would be placed in a special matrix, an adjustable metal frame, that held the type during the printing process. Gutenberg's type case contained an estimated 290 separate word boxes that housed letters, special characters, punctuation marks, ligatures, and other necessary symbols for printing. The physical press was an adaptation of the screw press commonly used in winemaking to crush grapes (replacing the ancient practice of persons stomping on grapes with their feet to crush them during the wine making process). To create print, Gutenberg would arrange the moveable type on a matrix, mount the matrix on the modified screw press, coat the matrix with ink, and lower the matrix until the type makes contact with the surface that was being printed on (typically paper, vellum, or cloth). The net result of the combination of metal press, automatic inking, and moveable type created a mechanical process that greatly increased the speed of printing. At the same time, the process reduced the cost of the materials. The development of the Gutenberg press to many represents the greatest technological innovation of that millennium because of the

various social, political, and economic impacts of the technology.

The process, once developed, provided a device quickly adopted and replicated in cities across Europe. Within a few decades, printing presses numbered in the hundreds, leading to the production of millions of volumes each year (compared with the tens of thousands previously). The ease of printing continued to increase dramatically the number of volumes of printed material available for reading; the increase was as much as a hundredfold. The importance of the press rose with the growth of literacy outside of the church and the aristocracy, within the rising middle class, including artisans and businessmen. The production of books not only made literacy possible (by increasing the number of educational materials) but also increased the value of literacy by generating a body of work that people could read. The improved economic status of the population provided the resources to purchase the available work. In combination, the changes in business, economic, and social practices enabled the Gutenberg press to exert a profound influence on social development. For example, a geography book once owned by Christopher Columbus is now on display in a Spanish museum, having been printed using movable type.

With the greatly decreased cost of reproduction of reading material and the accelerated speed of printing came the capacity to produce a huge number of books. The formation of libraries and the generation of bookstores grew with the rise of literacy. The idea of repositories of information, originally a primary role of monasteries, took on a civic or municipal function and became a practice of the burgeoning professional class. The function of libraries moved from the church to the state or city-state, thereby altering one element of power, the control over information.

One of the societal effects of the printing press was the ability to produce a wider range of materials for specialized audiences as well as for public education. Books dealing with, for example, techniques for fishing, books filled with bedtime stories or poetry, books of advice about agriculture became possible because an audience existed for the works and had the means to purchase them. Specialized audiences within the scientific community could create journals that allowed for the

regular exchange of ideas across vast distances. Such books and journals are credited with giving rise to the scientific revolution that started after the 1543 printing of the astronomer Nicolaus Copernicus's *De revolutionibus orbium coelestium* (*On the Revolutions of the Heavenly Spheres*). The usefulness of books on topics related to commercial development provided the basis of information that would eventually support both the exploration of the world and the industrial revolution. Technical drawings and manuals became easy to produce, permitting wider distribution of scientific breakthroughs and new manufacturing processes.

Religious Awakening

Probably the most influential or important book published by the press was the Bible. The Gutenberg Bible became synonymous with use of the printing press as well as the distribution of material associated with religion. The reduced cost and broader distribution of the Bible created both a benefit as well as a need for literacy. A rising middle class of merchants and artisans provided a ready market for books. One of the justifications for greater public literacy was the ability to read passages of the Bible, essentially increasing the scope of religion by enabling people to consume the original material. A printed Bible was easy to transport and permitted greater outreach by missionaries. The existence of a class of persons outside of the aristocracy with enough means to purchase books created an income opportunity for those producing the materials.

One of the effects of mass distribution of the Bible was a sense of entitlement on the part of individuals to read and interpret Biblical text. Such increased access to religious information facilitated to some degree the development of personal and shared orthodoxies inconsistent with a dominant or centralized view of faith. This, in turn, enabled the rise of a challenge to the Catholic Church from Martin Luther (1483–1546), an ordained priest, monk, and theologian. Luther's calls for church reform created the basis for the growth of religious populism, which ultimately challenged the primacy of the authority of the Catholic Church by creating the potential for decentralization.

The reaction by the Catholic Church in the Vatican as well as by secular authorities led to a focus on censorship and control of the press as a means of controlling the population. The Church then imposed the requirement for its imprimatur (Latin for “let it be printed”) to be granted in order for any book to be published. Without the prior approval of the Church, the authors and publisher risked the charge of heresy for publishing and distributing materials considered a challenge to the Church. The question of religious control of the press over all books served as one clash between secular and religious authority over the control over published material.

The primacy of the Church’s view was not restricted to religious text; the Church passed judgment on books dealing with politics and science. For example, the publication of a book expressing the astronomer, physicist, and engineer Galileo Galilei’s (1564–1642) heliocentric (sun at the center) view of the solar system challenged the official doctrine of geocentricity (earth at the center of the solar system), resulting in Galileo’s being sentenced by the Inquisition to house arrest on the charge of heresy. The Catholic Church’s view of all printed materials as relevant to religious dogma created a challenge between the desire for control by the religious authorities and the desire for independence by other elements of the social system. The religious leadership resolved the issue by evaluating all materials in religious terms, thereby often frustrating scientific progress.

The Gutenberg press permitted the rise of the use of vernacular languages for printing as opposed to Latin, used by the Church for documents and publications. Previously, most texts were printed in Latin, a shared language across much of Europe, and the official language for printed documents. The printing press made possible the printing of materials in the local language (e.g., French, English, German, Polish, Italian) and permitted a wider influence of written materials requiring no specialized literacy. The preference for the use of a local language reinforced a sense of nationalism and the separateness of the individual nations (city-states) while simultaneously providing the basis for national unity within the countries by creating the potential for a sense of shared information using a shared language.

Broadsheets and Newspapers

By reducing the cost and difficulty of publication, the Gutenberg press facilitated the generation not only of books but also of materials with shorter lifespans, such as broadsheets and what eventually became newspapers. Concurrently, with the growth of trading and connections between countries, the desire for news increased as the importance of issues such as exploration, taxes, and wars became apparent to a wider audience. This expansion of mercantile activity resulted in a shift in the feudal order of European society, with the prosperity of the new middle classes now rivaling the longstanding social and economic dominance of the hereditary land-owning aristocracy and forcing a redistribution of political power. Understanding the positions of municipal and secular leadership became a focus contributing to the rise of nationalism by generating popular understanding of shared interests. The citizenry became better informed and could therefore become involved in civic affairs and look after their interests on that basis.

The capacity to rapidly publish many copies of a given text allowed the producers of broadsheets and other printed ephemera to generate a disposable product. Thus began the profession and industry of journalism as means of finding and producing information for consumption by the general populace. Over time, the effect was to gradually accelerate the pace of change in those societies where literacy was advancing.

The growing distribution of broadsheets, pamphlets, and newspapers proved especially useful to certain elements of the society (guilds, political parties, government leaders, particular industries, and commercial interests), creating the basis for advertising as a technique for making potential buyers aware of products and for familiarizing potential supporters with political issues from a perspective that often favored specific interests. The Gutenberg press ultimately made possible the distribution of information related to local business conditions and opportunities, and as a means of political persuasion.

Growth of Censorship and Press Control

The development of the urban press also entailed a perceived need for the censorship of news

considered a threat to the existing social order. Controlling information became a central concern for both religious and secular authorities, particularly in response to any statements critical of the royals, the aristocracy, the Church, or governmental actions. Martin Luther, discussed earlier in this entry, used the press to produce copies of his 95 Theses and subsequent broadsheets to challenge the views of the Church, ultimately leading to his excommunication in 1521 by Pope Leo X and to his subsequent designation as an outlaw and heretic by the Holy Roman Emperor Charles V.

In the centuries that followed the Protestant Reformation in Europe, marked by a succession of religious and territorial wars and conflicts, arguments in favor of public access to information contested with arguments supporting the desire of established institutions to limit or suppress information seen as contrary to their interests. In the 18th century, the British Crown's restrictions on American colonists' liberties led to the War of Independence, and subsequently to the First Amendment to the Constitution of the United States, which guarantees a press free from government regulation and control. Indeed, the only specific industry mentioned in the U.S. Constitution was the press, to which the nation's founders granted as wide a set of freedoms as possible in order to ensure the establishment and maintenance of a free society.

Development of Copyright and Intellectual Property Law

The new ease with which the press could replicate an existing text meant that books produced by one company could be copied (exactly, or with desired changes) and then mass produced by a different press. This meant that writers (whether of fiction or nonfiction) as well as publishers of original work could reap little benefit from their efforts, since other presses could reproduce material without compensating the originators.

The development of legal copyrights and the concept of intellectual property ownership reflect the protection of value of the investment involved in the creation of textual material. The principle that intellectual work becomes property when expressed in writing represented something new as well as the reality of value that the Gutenberg

press had created by having made printing relatively cheap and quick.

Broadcast, Internet, and 3D Printing

The advancement of technology for communicating and distributing information continued with invention of the telegraph and the telephone in the 19th century; the invention of radio, television, and the electronic, digital computer in the 20th; and the rapid growth in the use of the Internet and platforms/servers in the new millennium. Whether such changes will prove as foundational as the Gutenberg press is for future historians to decide. Today's technologically enabled distribution of information continues to exhibit the initial centralization, decentralization (proliferation of sources), and subsequent recentralizing of the means of distribution of information as competitors are bought out and subsumed by larger corporate entities.

Project Gutenberg, founded in 1971, is the oldest digital library and is named to commemorate Gutenberg's legacy. The goal of Project Gutenberg is to digitize, archive, and disseminate cultural works by translating physical publications into eBooks. Most of the eBooks hosted by Project Gutenberg are in the public domain and free of charge, thereby promoting the spread of literacy by providing a large audience access to publications that further the legacy of the original Gutenberg press.

As we have seen, the Gutenberg press gave rise to the development of journalism as an industry, thereby introducing a major historical shift in the means of producing and distributing information that continues to this day. The central themes of access, censorship, participation, and diversity remain as vital and essential as they were 500 years ago. The forms and technologies of communication, and their range of applications continue to develop, as do the depth and breadth of societal effects and their implications. The current questions about restrictions on 3D printing for various designs (such as firearms) can be understood simply as an extension of the fundamental issues that arose with the origination of the Gutenberg press. Thus, the idea initially represented by the Gutenberg press, namely the capacity to increase the distribution of knowledge and decentralize

control of the flow of information, remains a driver of technological and social change throughout the world.

HARD VERSUS SOFT NEWS

While the terms *hard* and *soft* news are somewhat loaded, they represent the extreme ends of a continuum of standards in news value. Broadly speaking, most news stories can be separated into two types: the immediate and serious, and the less immediate and often less serious. Of course, there are nuances within each category, and the terms *hard* and *soft*, as well as *serious* and *less serious*, carry with them a wealth of value judgments about the legitimacy of journalistic efforts in relation to various subjects.

Hard news is the embodiment of the “watch-dog” or observational role of journalism. Typically, hard news includes coverage of political, economic, or military significance, or social issues with political, economic, or military implications (such as crime coverage and stories about political demonstrations). Hard news stories also carry temporal imperatives—hard news indicates events that are current and time sensitive.

Soft news, then, is everything else. The term *soft news* can be (and has been) applied to human interest stories, arts and entertainment, sports, celebrity gossip, society pages, and similar topics. In general, soft news stories are seen as less time-sensitive and covering topics that are not viewed as seriously or as having as great a societal impact as hard news coverage. Another way to think of soft news is as feature material. If the conventional wisdom about hard news is that its major

purpose is to inform, then it follows that the major purpose of soft news must be something else—to entertain, perhaps, as well as to inform. In the words of journalism historian Frank Luther Mott (1952), a hard news story is “interesting to human beings,” while a soft news story is “interesting because it deals with the life of human beings” (p. 58).

This entry introduces the concepts of hard and soft news and examines some common critiques of the terminology.

The Rise of Soft News

With the public inundated with news from a vast array of venues and media, from newspapers to television to the Internet, consumers often turn away from news entirely. Beginning in the 1950s but sharply escalating in the late 1970s, in order to offset the loss of readers and viewers, news organizations sought to increase the amount of entertaining, human interest stories they presented—and the manner in which those stories were presented. Dramatic content, faster presentation, shorter stories, and more happy endings became commonplace in the 1980s. Especially in cable news, in which demands of the 24-hour news cycle dominate the information landscape, more sensationalistic and “softer” news items are included, not only to attract and retain viewers, but simply to fill the hours of the day.

Sensationalism is often linked with soft news, although certainly not all soft news is

sensationalistic, and there is ample opportunity for hard news to be sensationalized. Media outlets do not have to simply focus on shock value, name recognition, or human interest to be sensationalistic—hard news stories can be sensationalized by focusing on emotional or dramatic elements of a story at the expense of context, background, or other information that may be more relevant to the public at large.

However, while this trend increased significantly as media venues proliferated toward the end of the 20th century, tabloid media and their sensationalistic leanings found roots as early as 1919. Published by Joseph Patterson and Robert McCormick, the *New York Daily News* focused primarily on scandals—the sexual peccadilloes of local well-knowns, violent crime stories, and the like. Its major rival, the *New York Post*, has taken the *News*'s sensationalistic, soft news-prominent approach and amplified the shock value with garish headlines and questionable photo doctoring. Then again, the *News*' influence is not simply limited to other tabloids; many of the particular stylings of the *New York Daily News*, such as the prominence of photography in its layout and extensive gossip and entertainment sections, have been adopted by major daily newspapers across the country such as *USA Today*.

To be fair, soft news does, in fact, attract viewers who might not normally take notice of daily events. However, the rise in soft news has also had significant impact on the public's perception of the quality and importance of news coverage overall. Despite efforts to attract more consumers, overall consumption of news (through almost all venues) is down and declining compared to years past. Public political engagement decreases as soft news coverage increases, as has been noted by scholars and media critics. According to Thomas Patterson (2001), soft news weakens "the foundation of democracy by diminishing the public's information about public affairs and its interest in politics" (p. 2). As the public's interest in public affairs and politics diminishes, consumption of news media decreases as well—with stark ramifications for democracy as a whole. According to a 2019 Pew Research Center poll, newspaper readership declined from 48,597,000 Americans to 28,554,000 Americans between 2008 and 2019; radio news listenership suffered a similar loss,

with decreases every year from 2008 to 2019. In addition, local television news viewing decreased by as much as 15% per year between 2008 and 2019. The largest blow, though, has been struck to network nightly television news, in 2019, only 5.2 million people, on average, tuned in to network news programs. Newspaper circulation has not reached levels so low since the 1940s; local television news is in a fairly steady decline. The only news sector in which there is marked growth is in cable news, and most cable news channels are programmed with a steady offering of soft news—sensationalized opinion in shorter segments with quicker paced presentation rather than traditional reporting. Whether it is because there are simply too many news outlets and it all becomes white noise, or because media critic Neil Postman was correct when he stated we are "amusing ourselves to death," public consumption of news as a whole is in rapid decline.

The format of presenting hard news is changing as well. Conventionally, hard news newspaper articles follow the inverted pyramid format of information structuring. That is, the journalist places the most important and interesting portions of the story near the beginning, with the less critical information coming at the end of the story. In this manner, readers can be sure they have most of the pertinent information in just the first paragraph or two of the story. However, as soft news styling has slowly crept into nearly every corner of journalism, the traditional inverted pyramid is being replaced by more narrative forms. Compared to the newspapers from as recent as the 1980s, nearly the entire contemporary newspaper is significantly softer than before. The "soft lead-in" to hard news stories is now fairly standard across news platforms, as stories begin with more descriptive and colorful tones before shifting into the more traditional reporting style.

As hard news reporting changes, so too does the nature of a great deal of soft news. Sports coverage is the most visible of the "serious" soft news genre, with its entrenchment in both print and broadcast news sources. The advent of ESPN, *Sporting News*, and other completely sports-related media outlets lends credibility and a hard news-type focus to the presentation of sports information. While entertainment news continues to maintain a softer approach, the legitimacy of

celebrity happenings, movie openings, record deals, and the like (as featured on programs such as *Entertainment Tonight*) have markedly increased in prominence with the expansion of entertainment coverage by many newspapers and entire networks devoted to entertainment news.

Coverage of the mid-2009 death of pop music star Michael Jackson provides an example of “gang” journalism—mobs of reporters and 24/7, often breathless, continuing coverage of every possible angle of the story, repeated endlessly. Where hard news was not available, speculation often filled in—or person-on-the-street interviews—to provide a measure of what viewers think. The Jackson story led evening network newscasts for several days, and again at the time of his funeral, and filled countless newspaper columns and even more cable news hours, blogs, podcasts, and tweets. The story was almost impossible to avoid and, argued some critics, crowded out other (often more important) stories.

Journalism has appreciably blurred the distinction between hard and soft news. The Pulitzer Prize has been awarded often in recent years not to breaking news presented in the traditional inverted pyramid format, but to the real stories of people’s lives as events unfold around them. Even in the wake of national disasters and tragedies, such as Hurricane Katrina in 2005 or the shooting of more than 30 people at Virginia Tech University in 2007, it is not the traditionally structured, “just-the-facts” approach that has been rewarded by the Pulitzer Prize committee, but the stories told through people’s faces, in their own words, that have impressed and moved the award body. For example, the Pulitzer for National Reporting was given in 1948 to the *Minneapolis Tribune* for stories on the Truman administration’s plan to “impose secrecy about the ordinary affairs of federal civilian agencies in peacetime”; in 2001, *The New York Times* received the same award “for its compelling and memorable series exploring racial experiences and attitudes across contemporary America.” In 1998, the *Los Angeles Times* received the Pulitzer Prize for Breaking News Reporting for its coverage of a bank robbery that led to a police shootout; in 2005, the award was given to the *Star-Ledger* for its coverage of the New Jersey governor’s announcement that he is gay and had an affair with a male lover.

Criticizing Terminology

The terms *hard news* and *soft news* are fraught with issues of vagueness and value relativity. One of the major criticisms of a distinction between the two is that, in the age of increasing media intrusion into the private lives of public figures and widespread access to media-producing technology, the line between what is public and private has blurred significantly in contemporary society. For example, a story regarding an uncovered tryst between a political figure and a prostitute would be hard news, as it may lead to the political figure’s resignation and possible prosecution. If the tryst was a legal one involving, say, the politician’s secretary, however, the story drifts into “soft” territory. In either case, the affair may constitute both political and social discussion.

The distinction between time-sensitive and -insensitive news is also not universal. For example, while sports are considered soft news, the reporting of breaking scores or player news often requires timeliness. A review of the weekend’s latest Hollywood release is sure to appear in the arts and entertainment section of major metropolitan dailies. Conversely, not all hard news stories require immediate distribution. An analysis of a candidate’s political platform, the reporting of this year’s crime statistics, or an article on the development of a particular technology may not need to be reported immediately. Soft news sometimes means feature or “evergreen” material that can run on slow news days. One manner in which researchers attempt to distinguish between hard and soft news is by examining the tone and style in which stories are delivered in an effort to discern if the intent is to inform or entertain—or, as is increasingly the case, both.

Finally, different news organizations make different judgments about what constitutes serious or timely news. There is no universal standard that signifies a clear distinction between hard and soft news. For example, if a major player in the National Football League is sentenced to prison, it would seem this would be a hard news report on the outcome of a criminal investigation. However, it could also be considered soft news, as the loss of a star player impacts the team’s ability to compete. This, in turn, becomes an economic issue, because the loss of the player could harm team revenue,

making the story, once again, hard news. The conviction of the player has legal, social, and business ramifications, which places it somewhere between the hard and soft labels.

Concluding Thoughts

The lines between hard news and soft news are not nearly as clear as they once were. There is a rapidly growing middle ground in which even hard news has adopted a more entertaining, human interest-oriented style, and in which some soft news has taken on a more serious, information-oriented tone. The major driver of the distinction, at this point, appears to be the market, and at this point in history, nearly all mass-distributed news is market driven. The “infotainment” style has come to dominate news presentation as news organizations chase the dollar as vigorously as they chase the story. Informing the public and entertaining the public are not only not mutually exclusive; in contemporary society, they are inextricably linked. As the chasm between hard and soft news shrinks, and the narrative blends in with the inverted pyramid approach to form a combined or melded category, the terms *hard* and *soft news* may slowly disappear altogether.

HAVAS

Havas was the world's first news agency, and after a century of operation, formed the core of the present Agence France-Presse.

Origins

Charles-Lewis Havas (1783–1858), a Frenchman of Hungarian background, began to develop an informal network of European reporters (today they would be called *stringers*) in 1825 to report about European financial and political events for French businesses, banks, and a few newspapers. Havas himself initially acted as translator. In 1832, he created the Bureau Havas in Paris, with an office located not far from the main post office, the French stock exchange, and several newspaper offices. A growing staff (which briefly included Bernhard Wolff and Julius Reuter, both of whom would go on to form their own news agencies) assembled financial news from other European capitals (some transmitted by semaphore telegraphs), translated it, and distributed it by messenger or mail to client newspapers in France and elsewhere.

Havas soon took over two small competing news bureaus. With approximately 200 client newspapers and a subsidy from the government, in 1835 the growing operation became known as the *L'Agence Havas*, usually recognized as the inception of the world's first news agency. By 1840, it was sending and receiving some news

reports by pigeon, enabling same-day news from London and Brussels to appear in major Paris newspapers.

By 1845, Havas operated as an effective monopoly in France and began to utilize the electric telegraph, initially with a line newly installed between Paris and Rouen. The founder retired a year later and his son Auguste-Jean took over direction of the expanding operation. In 1852, Havas took over a budding advertising agency, allowing the merged entity to provide both news and advertising to client papers and spreading the cost of operation. For many years, the advertising side of Havas helped to support the expense of newsgathering.

Beginning in 1860, Havas began news correspondence with South America, and in the 1870s with much of Europe. In 1879, family control ended with sale of the growing news and advertising agency to a Paris banker.

News Cartel

As early as 1856, Havas, Reuter in Britain, and Wolff in Germany signed an exchange agreement to share financial news from their own countries. It soon expanded to general news, and in 1859 to an agreement to create joint offices in different cities, subject at different times to the imperialist moves by the countries' respective governments.

By 1870, the three agencies established a cooperative news cartel, soon dubbed "The Ring," each agency taking responsibility for part of the world (Havas took the French colonies plus news of Spain and Portugal, Italy, and all of South America where no national agencies developed until after 1900), thus eliminating overlapping reporting and their related costs. All three made effective use of the growing web of undersea cables as well as land telegraphy and were accordingly often called *wire* services. With some changes, the cartel agreement was renewed in 1890 and again in 1914.

By World War I, Havas occupied a semi-official role in France. While the agency was a primary source of wartime news, it could issue only those stories approved by the French military command. Havas also refused to carry German military communiqués. Havas faced growing competition from new national news agencies after World War I.

A multiple address radio system was introduced in 1931 (thanks in part to government

financial aid), allowing Havas news to be more efficiently (and far less expensively) distributed across both Latin America and Asia. By 1933, a dedicated shortwave transmitter near Paris carried the service to some 2,000 newspapers worldwide, using automatic teleprinters. Any recipient could theoretically use such services, not just those with Havas subscriptions. However, with them, Havas was able to compete for a time with American news agencies in Latin America.

Teleprinters were also used by newspapers and radio stations within France (which relied almost totally on Havas for their international news), keyed to an extensive network of dedicated telegraph lines. Within the capital city, messengers and telephone links were used to distribute news. Havas controlled the national agencies in Spain and Italy until the mid-1920s. It received government financial support through the budgets of several ministries.

Demise

With the occupation of much of France by the German army in June 1940, however, Havas, cut off from many of its usual sources and clients, and operating from a country (and its colonies) in disarray, largely closed down. Indeed, many of its personnel became part of the French Resistance. News from Paris was controlled by Germany until 1944.

In August 1944, as Allied forces cleared Paris of the occupying German forces, the remains of Havas gave way to form the core of a new publicly owned Agence France-Presse.

HEALTH AND MEDICAL JOURNALISM

Health journalism provides news, analysis, and nonfiction narratives about issues of personal and public health. Print and digital journalism outlets across varying media types frequently cover news and advice about health matters directed to a lay audience. Indeed, health stories are some of the most prevalent and popular stories that run in the consumer media. Health news dovetails with several other journalism beats, including politics, business, public life, science, environment, sports, and lifestyle. Such stories are also referred to as *medical journalism*, *health reporting/writing*, and *medical/health news*. This entry examines historical precedents, the production and consumption of health journalism, and critiques of the form.

A Distinct Field

Health journalism is not a recent phenomenon in the United States. In fact, two prominent examples from the turn of the 20th century show just how enduring the fixation on health maintenance has been. Luther H. Gulick wrote for magazines (such as *Good Housekeeping*) and authored a 1907 book, *The Efficient Life*. Gulick obsessively outlined how to live a more vital, healthy life through good personal habits and mental attitude; he advised on how to battle common ailments; and he deemed prevention to be the “distinctively modern attitude toward disease.” Another was Bernarr Macfadden, a crusader for wellness and health, who wrote more than 100 health books and published a magazine called *Physical Culture* (founded in 1899) which included articles about nutrition, vitamins, fitness, and natural foods (decrying the “white bread curse”), remarkably similar to contemporary prevention coverage. A

focus on personal health was further entrenched by the birth of the “therapeutic society” in the 1930s, which appealed to a generally healthy, middle-class audience. Interest in health, especially from the historically therapeutic audience, has only continued to grow.

While health journalism in some cases grew under the umbrella of science writing and faces similar translational challenges, it is now considered to be its own field of reporting. Although information in science news is often relevant to health stories, the distinction is that science events have less direct bearing on individual action and are rarely given service-oriented treatment.

Health journalism is a primary source for the public to learn about personal health, medical developments, and health-related policy. Medical personnel often deal with patients’ questions and attitudes that are direct results of their exposure to mass-mediated health information (including direct-to-consumer [DTC] pharmaceutical advertising). Policymakers also rely on journalistic accounts of health to inform their decisions on laws and regulations. Because health journalism can have an impact on so many citizens, physicians, and legislators, media and medicine scholars analyze many facets of the field.

Health journalism is also a magnet for pharmaceutical and health care industry advertising dollars. The path from prescription products not being advertised to consumers before the early 1980s to the U.S. Food and Drug Administration’s revising the regulations on DTC advertising in 1997. Over the following 20 years, spending on DTC advertising tripled (totaling \$9.6 billion in 2016), and DTC advertising pays off with a \$9 return of every \$1 spent on advertising. Regulations on DTC advertising have emerged, distrust in pharmaceutical companies is high, and physicians have mixed responses on how DTC ads inform patients. From the journalism perspective, the explosion of pharmaceutical advertising has brought about an increase in editorial health content.

How It Is Produced

Health journalists’ primary function is to translate often technical medical science or health policy information into lay language. Although some

health journalists have a specialized background in medicine (as a physician or registered nurse, for example), many health journalists have not practiced medicine and come to the topic through other journalistic endeavors. Organizations to which people who produce health journalism belong include the Association of Health Care Journalists, the American Medical Writers Association, and the European Medical Writers Association.

Some scholars have investigated how health journalists do their work. Although many journalists lack specialized training in covering health news, they learn much of what they do on the job. Many health journalists consider the absence of a medical background a boon to their ability to present information in an understandable way. Rewording medical jargon, interpreting statistics, and extracting meaning from peer-reviewed articles are some of the skills that constitute their work as translators.

To explain health information, journalists use many tools. Journalism often serves as the public's only contact with people working in technical fields, and the presence of medical researchers and specialty physicians in journalistic health articles is no exception. Journalists often interview "experts" to help explain information in a clear, credible, and quotable manner. Depending on the subject, such authorities can include physicians, lead investigators for a medical study, nurses, trainers, malpractice attorneys, policymakers, psychologists, authors, nutritionists, spokespeople for pharmaceutical companies, social workers, and hospital administrators.

Another approach that health journalists use to present a story is interviewing "real" people to provide more of a human element or narrative component. Such people are experts in their own right, considering they have often suffered from a certain disease, faced a problem with the health care system, or participated in a clinical trial, among other experiences. Journalists often introduce a story with what is called an *anecdotal lead* (or *lede*) to hook the audience with a personal account or question and then get to the more complicated details later in the story. Journalists find that these personal stories give readers or viewers a way to identify with the issue and possibly diminish any stigma associated with it. Some

research has shown that audience members who read a personal narrative (instead of statistics, for example) are more likely to remember and take action upon the health information.

Data and statistics from medical research, which help impart credibility and explain risk factors, often surface in health stories. To help audiences understand data or other complicated medical ideas, stories will also include infographics or other visually informative elements (e.g., photos, videos, graphs, charts, tables, illustrations). Journalists also try to reword or define technical terms and often use metaphors or analogies to get across a concept that may otherwise be difficult to grasp.

Many health journalism stories include *mobilizing information*, another term for the how-to advice that offers directions for behavior or resources for additional information. The perception is that audience members want useful, practical tips they can use to take action. At times, health stories can be so condensed that the main focus is the takeaway information as opposed to the background research.

Where journalists get their story ideas and what they choose to cover is a central factor in their work. They often locate story ideas in recent medical journals, news releases from the federal government (e.g., the Centers for Disease Control, the National Cancer Institute), social media, newly published books, audience feedback, announcements from nonprofit advocacy organizations, press releases from universities, and other competing journalism outlets. Some story ideas stem from recurring calendar-based events (e.g., Breast Cancer Awareness Month). Pharmaceutical companies and for-profit health care organizations also jockey for coveted editorial space and airtime through publicists who seek source-initiated news. Sifting the good science from the bad is a challenge for health journalists in that they receive constant appeals, often via press releases, for coverage.

Health journalists cover topics that range from the hard-hitting, such as fraud in medicine or hospital mortality rates, to the more personal, such as deciphering nutrition labels and recommended screenings for cancer. These topics include, but are not limited to, research findings, health care policy, wellness/prevention, patient care, diseases,

public health, infrastructure, malpractice, pharmaceuticals, diet, and exercise. Considering how health journalism is disseminated, digital media excel at covering breaking health news, while print may be better for interpreting in-depth health information. Medical information is continually evolving as new research emerges; therefore, potential story topics are nearly infinite.

How Health Journalism Is Consumed

Health journalism is a form of health communication to the public. Although early definitions of health communication restricted it to medical settings (patient–physician communication) or public health campaigns, the focus has broadened to include health journalism.

What readers and viewers do with the information that health journalism provides is of paramount importance. Scholarship on how the audience evaluates and uses health reporting, however, is notably lacking. The extant research has shown that health journalism likely has its main impact in alerting readers to the existence of a health problem or new discoveries. It is unlikely that audience members will make a health behavioral change based only on information they learn about through health journalism. Especially with the pace of social media feeds, audience members often do not fully recall health information they get through news media and what they do recall and attend to is filtered through how it relates to them and their current attitudes and behaviors. Before making a behavior change, readers often seek more information online and consult an interpersonal source, such as friends, family, or a medical practitioner. The idea that health information could be a “magic bullet” for changing people’s health behaviors is flawed, though it plays a cognitive role in the decision-making process. The availability of substantial amounts of health information is not proof that audience members actually act on it.

As in other fields, there has been a surge in web use for learning about health. The widespread use of the Internet has prompted new paradigms in health communication and information seeking. Most web health sources are not affiliated with journalistic outlets. This is a logical extension of the fact that many people who search online are

motivated by a particular health situation, while those who read or see health journalism are often not seeking specific health information. People’s individual health needs are too specific and time dependent to coincide perfectly with a health journalism piece, which is one reason why most stories appeal to a general audience seeking prevention or wellness information.

Challenges

There are several critics of health journalism who offer valuable comment about both process and product. Physicians and scientists have criticized journalists for misleading the public with incomplete, incorrect, oversimplified, or premature medical coverage. Some researchers believe that poor health reporting constitutes a public health threat. Many of the problems that are commonly cited, such as simplification, single-source stories, premature reporting, and sensationalism, exist because health stories must satisfy traditional news values, such as impact, timeliness, and conflict. Moreover, some of the exaggeration found in health news stories has been traced back to press releases about the medical science findings and to the original research articles. One reason why people heavily criticize health journalism is because the stakes are assumed to be higher with such reporting than with most other subjects. Inaccurate medical reporting can cause panic, cultivate false hopes, or influence an individual’s health decisions.

Several scholarly studies have examined the quality of health journalism. Content analyses of accuracy, scientific evidence, and representations of risk have found health journalism to be lacking on each measure. The crux of the critique from those who seek to accurately present scientific findings is that health journalism is oversimplified. Original medical research is so reduced by the time it reaches audience members that it can be erroneous or misleading. Any caveats or expressions of uncertainty are downplayed or removed. Furthermore, because evidence of medical research rarely appears in full, the public cannot weigh the quality of the information. This, however, presumes a reader or viewer who has a high level of health literacy, which might not be representative of much of the general public. A concept of health

literacy, or a person's ability to obtain, understand, and act upon health information, is percolating among health journalists whose ideas of the audience members are factored into nearly every level of reporting. Using the lens of a moderately health-literate reader, a health journalist would likely simplify health information to make it comprehensible.

Scholars have also argued that most commercial media outlets cannot adequately respond to public health problems for two reasons. For one, informing people about health problems is not the panacea that many idealize it to be given that behavior change is a complex process. Also many health problems cannot be solved by individual action because they are related to social and environmental factors. These broader health problems are undercovered in health journalism because these are complicated and controversial, and they provide little direction for individual action.

Essentially, there is a gulf between the democratic function of making medical information understandable and the scientific function of advancing knowledge. All is not lost given that researchers have shown much health journalism to provide accurate and reliable health information. Thus, for many, journalism outlets are valuable vehicles for health communication.

In addition, several attempts to address these critiques have been made. Ongoing training for professionals, published field guides, and media criticism scorecards (e.g., those offered by Health-NewsReview.org until 2018) all serve to improve health journalism.

A separate but related problem is the spread of misinformation via nonjournalistic outlets, such as mock news sites, personal blogs and websites, social media memes, disinformation campaigns, bots, and viral videos, among others. Fact-checking websites that use credentialed expert crowdsourcing have sprung up to assist the public in deciphering evidence-based information from unsubstantiated claims (e.g., HealthFeedback.org, Metafact). In addition, some social media platforms have taken steps to block the spread of false health messaging (e.g., antivaccination misinformation). Although the spread of false health information long predated the term *fake news*, such as dangerous patent medicine advertising in the late 1800s and tobacco companies bankrolling sham cigarette

studies in the 1950s, the decrease in editors and fact checkers has permitted the proliferation of more deceptive health information.

Concluding Thoughts

Critiques help make clear why studying the production and consumption of health journalism is important to understanding the communication of complex issues. Sometimes derisively referred to as *soft news*, or *lifestyle journalism*, it is clear health journalism should not be so easily dismissed. Another reason why health journalism is important is that some audience members do act on the behavioral advice they encounter. This possibility is part of what drives health journalists to provide accurate information, and it also intensifies the significance of their work.

Health journalism, along with information received from family, friends, medical professionals, and websites, helps to shape an individual's perceptions about health and keeps people informed about health-related policies.

HEARST, WILLIAM RANDOLPH

William Randolph Hearst (1863–1951) is one of the most controversial and disparaged names in journalism. Hearst was a wealthy editor, publisher, entrepreneur, politician, art collector, and studio owner whose career helped define several periods of innovation and excess in American news media. He was a vigorous, larger-than-life character to whom the barnacles of media myth are firmly attached. That Hearst wielded such dark power as to foment a war is but one example. This entry examines Hearst's career, his journalism, his political aspirations, his private life, and his legacy.

Early Years and Rise in Journalism

Hearst was born in San Francisco in 1863, the only son of a Missouri farmer, George Hearst, who struck it rich as a mining entrepreneur in California. His doting mother, Phoebe, was a Missouri schoolteacher before her marriage. Afterward, she became a philanthropist and suffragist who hoped her son, who was shy and somewhat aloof, would settle into a place in high society. Although he enjoyed the trappings of privilege and wealth, Will Hearst opted for newspapering. After leaving Harvard University without a degree, he took charge of the *San Francisco Examiner*, which his father had acquired in part to promote his political ambitions. (George

Hearst was a U.S. Senator for four years.) Will Hearst was not quite 24 years old when he became proprietor and editor of the *Examiner* in 1887. It marked the origin of what is today a New York-based diversified media giant.

Hearst turned the *Examiner* into an aggressive, well-written, and self-promoting newspaper. He unselfconsciously gave the *Examiner* the tagline “Monarch of the Dailies” as it became the market leader. Its success was due in part to a diet of crime and corruption stories and in part to Hearst's inspired hiring decisions. Notably, he brought to his staff Ambrose Bierce, a gifted and lacerating essayist and short story writer whose column in the *Examiner* ran for years. Bierce recalled how Hearst, in offering him a job, spoke in a small voice redolent of “the fragrance of violets made audible.” Another important hire was Annie Laurie, the pen name of Winifred Black, a “sob sister” whose columns supposedly were so melodramatic they made readers weep. Annie Laurie was a lifelong devotee of Hearst and remembered the *Examiner* fondly as “a place full of geniuses” who happened to be newspaper people.

Hearst's work in rejuvenating the *Examiner* was preparatory for a cross-country move to New York City, where he intended to challenge for newspaper supremacy. Hearst understood that establishing himself in the country's largest market was key to establishing a media empire. In September 1895, he paid \$150,000 to acquire the money-losing *New York Morning Journal*. He dropped “Morning” from the title and promptly stirred up a newspaper scene marked by the advancing age and absenteeism of editors and owners who had towered over the city's journalism for years.

Prominent among them was Joseph Pulitzer, whose techniques Hearst had admired if not copied. Pulitzer, the owner-publisher of the *New York World*, was in such chronic poor health that he rarely was in New York after 1890, the year the copper-domed World building was opened along Press Row in lower Manhattan. Until his death in 1911, Pulitzer traveled almost ceaselessly, seeking to recover his health while running the *World* remotely, in barrages of letters and telegrams. Remote control also was practiced by James Gordon Bennett Jr., the bon vivant publisher of the

New York Herald. Bennett, known as *Commodore*, spent most of his time in Europe where sailing yachts and mixing cocktails were among his favored pastimes. Charles A. Dana of *The Sun* was another of the prominent journalists of the post-Civil War period. By the time Hearst arrived, Dana was in his 70s and in failing health. He had begun to distance himself from the day-to-day operations of his feisty newspaper.

Journalism of Action

Even with the eclipse of its most prominent figures, the New York market was still highly competitive and scarcely welcoming to upstart newcomers. For Hearst, the *Journal* had to stand out, had to be made irresistible. He often succeeded, offering a rich variety of accounts on the front page about crime, high society, politics, and sports. The stories were often accompanied by multicolumn line drawings and bold headlines. The *Journal's* appearance and content were vivid, provocative, and sometimes sensational. Hearst took to calling his approach "the new journalism" and, later, the "journalism of action." By that, he meant that newspapers had a responsibility to go beyond routine gathering, reporting, and interpreting of the news. They were obliged to take a conspicuous role in confronting the failings of government and society. The *Journal* injected itself as a prominent actor in solving murder mysteries, delivering charity, and filing court injunctions to block suspected abuses of municipal government.

It was a heady, activist style of daily journalism that borrowed indirectly from an 1880s theory in Britain of "government by newspaper" and mixed attention-grabbing stunts and adventures with uninhibited self-promotion. Such flamboyance helped make enemies among Hearst's rivals who saw presumption and arrogance in the journalism of action. They were not entirely mistaken. The *Journal* after all once proclaimed that the journalism of action represented "the final state in the evolution of the modern newspaper."

A high moment in Hearst's journalism of action came in October 1897 when Karl Decker, a reporter for the *Journal*, helped plan and bring about the jailbreak in Havana of Evangelina Cisneros, a 19-year-old Cuban political prisoner. She had been held without charges for more than a

year, suspected of plotting to kidnap and kill a senior Spanish officer in Cuba. Cisneros claimed the officer made an unwelcome sexual advance on her. Decker, who was ostensibly the *Journal's* correspondent in Havana, was under Hearst's orders to secure her freedom. To pull off the caper, Decker tapped into a clandestine smuggling network in Havana for crucial assistance. U.S. diplomatic personnel in Cuba lent quiet support.

After hiding in Havana for 2 days, Cisneros was dressed as a boy and smuggled aboard a passenger steamer bound for New York. Hearst organized an enthusiastic reception for Cisneros; a crowd of 75,000 people turned out to welcome the young refugee. Her jailbreak was a stunning if ethically dubious coup and the *Journal* played it up dramatically. Cisneros was "epochal," the *Journal* said, a "supreme achievement of the journalism of action."

Hearst's journalism of action was again on vivid display at the close of 1897, when he threw for New Yorkers a New Year's Eve celebration to mark the consolidation of Gotham's five boroughs into a mega-city. City officials were not inclined to celebrate; the outgoing mayor was a foe of consolidation and suggested a mock funeral would be more fitting. Hearst stepped forward to put on what the *Journal* called a *great carnival* featuring "volcanoes of fireworks and floods of pulse-quickenning music" near City Hall Park and Press Row. Perhaps 100,000 merry-makers braved rain, freezing rain, and snow to join in what the *Journal* called the "luminous starting point from which the history of the expanded New York will be dated."

The celebration costs the contemporary equivalent of at least \$500,000, which was emblematic of Hearst's willingness to spend money (or, more accurately, to draw on the fortune his mother had inherited after his father died in 1891) in making the *Journal* stand out. He sometimes paid lavishly to lure high-priced talent to his staff, to the annoyance of his rivals. He also recruited prominent names in literature and art for an assignment or two. Mark Twain went to London for Hearst to write about Queen Victoria's diamond jubilee. Richard Harding Davis, a novelist, playwright, and up-and-coming war correspondent, went to Cuba for Hearst in early 1897, to report on the island-wide armed rebellion against Spanish

colonial rule. Davis was paid \$3,000 for a month's work—the equivalent in 2020 of more than \$90,000.

Accompanying Davis to Cuba was Frederic Remington, the celebrated artist of the American West who was to draw sketches for the *Journal* of scenes of the rebellion. The Davis-Remington pairing was awkward and strains quickly emerged, in part because of long delays in reaching the island. At the urging of the headstrong Davis who disliked working in pairs, Remington left Cuba six days after arriving. The circumstances of Remington's departure have given rise to one of the most tenacious myths in American journalism.

According to an unsourced account published 4 years later by James Creelman, an unabashed admirer of Hearst who was in Spain when Remington was in Cuba, the artist asked permission to come home. He supposedly cabled Hearst from Havana, stating: "Everything is quiet. There is no trouble here. There will be no war. I wish to return."

In reply, according to Creelman, Hearst declared, "Please remain. You furnish the pictures, and I'll furnish the war" (Creelman, 1901, pp. 177–178).

Hearst's purported vow to "furnish the war" has become one of the most memorable and often-repeated lines in American journalism. It probably is the single comment most often attributed to Hearst. But the presumed Remington-Hearst exchange is almost certainly apocryphal because

- the telegrams supposedly sent by Remington and Hearst have never turned up.
- the anecdote founders on an internal inconsistency: Why would Hearst pledge to "furnish the war" when *war*—the Cuban rebellion against Spain—was the reason he sent Remington to Cuba?
- Spanish censors in Havana rigorously controlled incoming and outgoing telegraphic traffic and likely would have intercepted—and no doubt publicized—Hearst's incendiary vow, had it been sent.
- Remington left Cuba for New York, despite the supposed instructions from Hearst to "remain." Upon his return, Remington's sketches were given prominent display in the *Journal*—not the kind of treatment Hearst likely would have extended to an insubordinate artist.
- Hearst's supposed response to Remington ran counter to his newspaper's editorial position on Cuba in early 1897. The *Journal* then was not calling for U.S. armed intervention in Cuba. The newspaper's editorials at the time were anticipating the *collapse* of Spain's military efforts to put down the rebellion.
- the anecdote's sole original source, Creelman, had serious credibility problems. His reporting about a massacre in China was pointedly disputed by an official U.S. government report in 1894, for example. Creelman, moreover, never explained how he learned about the presumptive Remington-Hearst exchange.
- Creelman intended the anecdote as a compliment to Hearst's activist, forward-looking journalism. Creelman did not offer the anecdote as condemnation.

Over the years, the anecdote was transformed from compliment to evidence of Hearst's supposedly malign power. The dubious "furnish the war" vow has been frequently invoked to buttress a related and similarly tenacious myth, that Hearst and his newspapers brought about America's war in 1898 that expelled Spain from Cuba. The claim is simple enough: the sensational and exaggerated content in Hearst's New York and San Francisco newspapers supposedly stirred war fever in the United States to such an extent that American intervention in Cuba became inevitable. Congress declared war in April 1898, and the conflict was over in less than 4 months. Spain was ousted from Cuba, Puerto Rico, Guam, and the Philippines.

The myth that Hearst brought about the Spanish-American War lives on as an easy-to-grasp explanation about the derivation of a long-ago conflict. Serious historians of the conflict have dismissed the interpretation as superficial, media-centric, and deeply flawed. The war with Spain was the upshot of a three-sided impasse. The Cuban rebels fighting for independence would settle for nothing less. The Spanish would not acquiesce and imposed harsh measures in trying to put down the rebellion. Americans were horrified by the humanitarian disaster Spanish policies brought to Cuba and stunned by the mysterious explosion in Havana harbor in February 1898 that destroyed the battleship USS *Maine* and killed

266 U.S. naval personnel. Americans could no longer tolerate the disruption just 90 miles from their shores. Diplomacy failed to resolve the impasse; war ensued.

Hearst and his newspapers did not create the differences that resulted in the three-sided impasse. He and his newspapers had nothing to do with the imposition of Spanish policies that caused widespread death and dislocation in Cuba. The contents of Hearst's newspapers were not somehow transformed into military action. Hearst's newspapers did not summon Americans to arms in 1898. The conflict with Spain was assuredly not "Mr. Hearst's war."

Hearst did, though, spend heavily to cover the Cuban theater of the war and traveled to the front himself aboard a refitted fruit steamer—accompanied by a crew, cooks, reporters, a photographer, pressmen, and two female vaudeville performers (one of whom was his future wife). Hearst's timing was propitious. He arrived in time for the climatic land battle of the war near Santiago de Cuba and the naval engagement 2 days later that destroyed the Spanish fleet. A group of beleaguered Spanish sailors who had left their burning ships even surrendered to Hearst as his steamer maneuvered off southeastern Cuba. It was part terrific timing, part farce. In a way, it was the journalism of action gone to war.

Political Ambitions

The war's end left Hearst in a downbeat mood. Unlike his emergent rival, Theodore Roosevelt of Rough Riders fame, Hearst did not return to a hero's welcome in New York. It is sometimes said Hearst had encouraged the war as a cynical means to build circulation and reap the profits. War-related reporting did attract readers, but at considerable cost: Advertising fell off. Wholesale newsprint prices surged. The *Journal* figured its war-reporting expenses topped \$750,000—the equivalent today of almost \$23 million. His papers were losing money.

The war's aftermath was accompanied by a broad letdown across American journalism. A conflict with Spain over Cuba had been anticipated for many months and, rather abruptly, it was over. Spain had given up. An unexpected legacy of the war was that the United States

became a colonial power, a contradiction of its long-standing foreign policy. In the Philippines, one of the country's new possessions, a nasty insurgency went on until 1902.

For a while, Hearst toyed with the idea of seeking the Democratic nomination for New York governor in 1898. He had lived in the state only 3 years and demurred. Roosevelt won that election in a tight race. Hearst kept edging into politics while nursing national ambitions. In 1900, he became president of the National Association of Democratic Clubs. Two years after that, he was elected to the first of two terms in Congress from a New York City district. To support his ambitions and the Democratic party, Hearst expanded his newspaper holdings to Chicago, launching the *American* in 1900. It was a step in Hearst's pursuit of a nationwide media empire. Within a few years, he had started newspapers in Boston and Los Angeles. The expansion of titles increased Hearst's national standing, but it had a stifling effect on the journalism of action. Instead of honing and developing that paradigm, Hearst politicized his newspapers. They became platforms for his political ambitions, which reached a height in 1904.

Hearst sought the Democratic nomination for president that year, spending heavily to build a campaign organization that would deliver delegates' votes at the party's national convention in St. Louis. Hearst's platform was pro-worker, pro-union, and anti-monopoly. After early successes, Hearst's bandwagon stalled. He failed to win the backing of William Jennings Bryan, whom Hearst and his newspapers had eagerly supported for the presidency in 1896 and 1900. In voting at the convention, Hearst came in second to Judge Alton Parker, a conservative. Parker in turn was drubbed by Roosevelt in the 1904 general election. Hearst settled for reelection to Congress. It was to be his last electoral victory.

Hearst was never especially popular in New York City journalism, given his flamboyance and chronic self-promotion, and unpopularity carried over to local and state politics. During the first decade of the 20th century, Hearst twice ran for mayor of New York City and lost both times. He ran for New York governor in 1906 and lost. By decade's end, Hearst returned to expanding his media holdings, adding magazines and, later, a motion picture studio and radio network to what

was becoming a nationwide empire. In the 1920s, Hearst commissioned a headquarters building for his company—a six-story structure near Columbus Circle in New York City which, in the early 21st century, became the base for a glittering corporate tower that is the headquarters of the privately owned Hearst Corporation.

The early Hearst, the ambitious young publisher on the make in San Francisco and New York, invariably was a more fascinating character than the later Hearst, the aging media tycoon and art collector who became vigorously anti-communist, traveled extensively in Europe, and dabbled some in foreign affairs. Hearst once said as much, in recalling his early years in journalism. “Those were wonderful days, and happy achievements of youth,” he wrote in a column for his newspapers late in life. “No grandiose performance of later years ever equaled them in satisfaction. Life was not ‘one damn thing after another’ then. It was one wonderful adventure after another. . . . There was delight in work, happiness in service, joy in life—for we were young” (cited in Whyte, 2009, pp. 465–466).

Hearst's Private Life

Hearst always seemed ready to tweak or flout social convention. He did so in marrying Millicent Willson, a former vaudeville performer nearly 20 years his junior. Hearst had courted her for several years (and took her to Cuba in 1898 aboard the refitted steamer). Together they had five sons. She left Hearst in the 1920s after he became involved with a stage and screen actress named Marion Douras, who was better known as Marion Davies. Hearst never divorced Millicent but never returned to her after Davies became his companion. Davies was hostess for the lavish parties that Hearst sometimes threw at his opulent but never-finished castle at San Simeon, not far from the coast in central California.

Hearst's complicated private life was scandalous by norms of the time and became grist for Orson Welles's portrayal in *Citizen Kane*. The film was not a biopic and took liberties in depicting Hearst, his career, his parents, his wife, and his mistress. Hearst mustered his considerable clout in media circles and tried to block the film's release. He failed. *Kane* came out in 1941 to mixed reviews and was not a commercial success.

Years later, after Welles's genius was acknowledged, *Kane* gained recognition as one the finest motion pictures ever made. But it was a misleading caricature of Hearst. As biographer David Nasaw (2000, p. 574) wrote, Hearst “never regarded himself as a failure, never recognized defeat, never stopped loving Marion or his wife. He did not, at the end of his life, run away from the world to entomb himself in a vast, gloomy art-choked hermitage” as did the movie's lead character, Charles Foster Kane.

Hearst died in August 1951 and was buried in the Hearst family's private mausoleum south of San Francisco. His legacy endures notably in the Hearst Corporation, a diversified, multibillion-dollar media giant. The company's holdings include *Esquire*, *Cosmopolitan*, *Popular Mechanics*, and numerous other magazines; newspapers in Houston, San Francisco, and elsewhere; television stations, and financial stakes in cable television channels such as ESPN. It is a conglomerate that projects a modest corporate profile—a profile in decided contrast to the flamboyance of its founder and namesake, William Randolph Hearst.

HEMINGWAY, ERNEST

Novelist Ernest Hemingway, winner of the Nobel Prize in Literature, began his writing career as a journalist and continued writing nonfiction—dispatches, long-form pieces, and memoir—for the rest of his career. Although he occasionally made derisive comments about journalism and its practitioners, he also acknowledged the role his reporting played in forging his distinctive and oft-imitated style.

Early Life

Born in 1899 in Oak Park, Illinois, Ernest Miller Hemingway was the son of a physician, Clarence Hemingway, and Grace Hemingway. He was the second of six children and grew up as the only male child until his brother was born 16 years later. He was thus his father's companion on regular hunting and fishing trips to Michigan, adventures which inspired some of his early short stories.

Journalism Career

He worked on his high school newspaper and yearbook, which gave him a taste for journalism. After graduation, he went to work for the *Kansas City Star*, where he was immersed in the practices of professional journalism. The inverted-pyramid style—which required that the most important elements appear first in the story—was taught by the *Star*'s editors. Hemingway cited the *Star*'s terse style guide for reporters as a lifetime influence on his writing. He followed the guide's instruction to write using short vivid sentences and to omit superfluous details.

Hemingway left his job at the *Star* after 6 months to enlist as an ambulance driver during the First World War. After 2 months in Italy, he

was injured in a mortar attack, which was so serious that hospital doctors considered amputating his leg. After returning home, he found that his war experiences created a gulf between himself and his parents and left home for a job in Toronto.

While in Canada, he had made an alliance with the *Toronto Star*, marking a return to journalism. Soon after his marriage to Hadley Richardson in 1921, he returned to Europe as the Paris correspondent for the *Toronto Star Weekly*.

As European correspondent, Hemingway proved himself as a reporter, covering war in Greece and witnessing the burning of Smyrna. He covered hard-news stories, but also published comic tales of the French for the amusement of Canadian readers.

In Paris, he strayed a bit from the rigors of the style drilled into him by the *Kansas City Star* editors. He became part of the expatriate literary crowd—Ford Madox Ford, James Joyce, F. Scott Fitzgerald, and Gertrude Stein, among others. Moving away from the conventions of everyday journalism, he developed a dry, comic style for his lifestyle pieces about Europeans.

Literary Career

Soon he began to pursue a more literary career, publishing a chapbook of poetry and a slim volume of stories with a lower-case title, *in our time*. Fitzgerald became Hemingway's champion and recommended Hemingway to Charles Scribner, who had published Fitzgerald's first novel, *This Side of Paradise*. By 1926, Hemingway had joined Fitzgerald as a Scribner author, working with editor Maxwell Perkins (who would also guide Thomas Wolfe and James Jones). Hemingway's first novel, *The Torrents of Spring*, was a minor work, but later in 1926, *The Sun Also Rises*, his first major novel, appeared.

Hemingway began to publish his novels and story collections, which together comprise one of the most significant bibliographies of 20th century American Literature. After *The Sun Also Rises* came the novels *A Farewell to Arms* (1929), *For Whom the Bell Tolls* (1940), and *The Old Man and the Sea* (1952).

After he published his second major novel, *A Farewell to Arms*, in 1929, and then two book-length nonfiction books: *Death in the Afternoon*

in 1932 and *Green Hills of Africa* in 1935. Both were memoirs concerning two of his major occupations: bullfighting and hunting. The success and popularity of Hemingway's novels made him into an international celebrity.

Commingle Journalism and Literature

But Hemingway never fully left journalism—or rather his personalized version of journalism—behind. Simultaneously with *Death in the Afternoon* and *Green Hills of Africa*, Hemingway contributed personal reportage to *Esquire*, a new magazine founded by Arnold Gingrich. Gingrich urged him to stick to stories of hunting and fishing, in line with the theme of this new men's magazine. The “letters” (as they were called) were often like diary entries.

One of the most successful of these pieces was “Monologue to the Maestro,” in which a young acolyte from Minnesota—dubbed “the Maestro” because he plays violin—treks to Key West, Florida, to learn about writing from Hemingway. It is comical, but it also contains a telling comment about Hemingway's view of journalism. When the protege asks Hemingway about what differentiates serious writing from mere reporting, Hemingway says, “If it was reporting they would not remember it.”

Hemingway tells the Maestro that what gives writing life is the ability to describe action and events in such a way that readers then visualize what the writer is describing, becoming a collaborator in the storytelling. The reader's imagination, Hemingway lectures, will complete the picture. The element of immediacy—vital to daily reporting—is soon lost and in order for a piece of writing to endure, it must be “round and whole and solid,” as Hemingway says.

Even when he was ostensibly back in the world of reporting, his status as a celebrity affected his reporting. An example is Hemingway's coverage of the Spanish Civil War for the *North American Newspaper Alliance*. By the time he left for Spain as a correspondent in 1938, Hemingway had made it clear that he would not be an impartial reporter. He had signed on to produce a documentary to raise money for the cause of the rebellious peasants. This role as a fundraiser for one of the warring sides in the conflict compromised his journalistic credibility.

In much of his writings, Hemingway employed a direct, I-was-there reporting style. It was also not unusual for Hemingway to place himself at the center of the story. His stories from Spain often delve into his gathering of information, allowing readers to see the under-the-surface levels of his storytelling. In his journalism, Hemingway often resorted to direct-address.

Hemingway returned to journalism in his last years to write “The Dangerous Summer,” a series for *Life* magazine about the son of the bullfighter who had inspired a character three decades before in *The Sun Also Rises*. Hemingway produced a huge manuscript, which the editors spread over three issues. It was not published in book form for a quarter century.

A Moveable Feast (1964), his memoir of Paris in the 1920s, was filled with stories of his colleagues Fitzgerald, Stein, and others. A collection of his journalism dating from his *Toronto Star* days, *Byline*, appeared in 1967. A later collection, *Dateline: Toronto* (1985), collected previously unpublished pieces. *Under Kilimanjaro* (2005), though a memoir, was the complete manuscript of a book that had been published in 1999 as a novel, *True at First Light*.

Private Life

Hemingway was married four times—three times to journalists: Pauline Pfeiffer worked for *Vogue* in Paris, Martha Gellhorn was a celebrated war correspondent, and Mary Welsh, whom he met in London while they were both covering the Second World War. He had three sons: John, known as Jack, with first wife Hadley Richardson; and Patrick and Gregory, with Pauline Pfeiffer.

His most fecund years were in Key West, where he finished *A Farewell to Arms* and wrote most of *For Whom the Bell Tolls*. In the decade between the appearance of those books, he published two nonfiction works (*Death in the Afternoon* and *Green Hills of Africa*), a novella (*To Have and Have Not*), and two story collections (*Winner Take Nothing* and *The Fifth Column and the First Forty-Nine Stories*, which also contained the script for a play). He produced two documentaries about the war in Spain intended to raise money for the revolutionaries. This is also the era when he contributed regularly for *Esquire*.

He was remarkably productive, yet also maintained an active life as a sportsman and tavern raconteur. He made friends with fishermen, handy-men, and others, reveling in the live-and-let-live ethos of the village at the end of the road.

He later moved to Cuba but left for his final home, in Idaho, in 1959. It was there, in the village of Ketchum, where he took his life by gunshot on July 2, 1961.

HERSEY, JOHN

Reporter and novelist John Richard Hersey (1914–1993) created *Hiroshima* (1946), cited as the greatest work of American journalism in the 20th century. This book was a harbinger of the “new journalism” explosion of the 1960s, yet

within a few years Hersey had become a critic of the form. His fiction and nonfiction were driven by a concern for social justice, and he served as one of the greatest practitioners and the brooding conscience of the literary journalism movement he helped inspire.

Early Years and Education

Born in 1914 in Tientsin, China, Hersey was the son of American missionaries Roscoe and Grace Hersey, who were posted overseas by the YMCA. Hersey spent his early years in China, but at the age of 10 he returned to the United States with his parents, to Westchester County, New York. He finished his secondary education at Hotchkiss School in Connecticut and then enrolled at Yale University.

At Yale, Hersey made the football squad, and future president Gerald Ford was a teammate. Hersey also worked on the *Yale Daily News* and was a member of the secret society, Skull and Bones. As was the case for any Yale student who distinguished himself at the *Daily News* in that era, Hersey was offered summer work at *Time* magazine while still in college. Henry Luce, founder of the Time-Life empire, had a nearly identical life to Hersey's—born to American missionaries in China, Luce's educational and career path followed the same trajectory, a quarter century before. At Yale, Luce had worked alongside classmate Briton Hadden at the *Daily News* and they partnered to create *Time* magazine in 1923. A decade later, Hadden was dead and Luce had turned the company he started with a classmate into an empire that included *Fortune* and *Life* magazines.

Luce regarded Hersey as something of a protégé, but Hersey and Luce diverged radically on politics. Luce's inherent conservatism was offensive to Hersey, who bespoke classic liberal values. At first, Hersey resisted Luce's efforts to bring him into the Time-Life fold. After college graduation in 1936, Hersey studied at the University of Cambridge for a year, and then returned home to become personal secretary to Sinclair Lewis, the first American writer to win the Nobel Prize for Literature. Working for Lewis was a trial. The elder writer was in decline, and his early triumphs, including *Main Street* (1920) and *Babbitt* (1922),

were in the rear-view mirror. His writing was skidding downhill and Lewis often was drunk. Hersey's duties included mixing drinks and driving for Lewis. Yet this difficult apprenticeship exposed him to the life of a writer.

Eventually, Hersey joined *Time* magazine, where his dispatches were printed without his byline, which was the magazine's style. The magazine's prospectus had vowed that the contents would appear to readers as if written by one person, for one person. There was no room for a writer's voice or ego. This meant that Hersey and other reporters for the magazine were subject to the editing of Whitaker Chambers, whose position at the magazine gave him license to revise the copy of liberal reporters to reflect Luce's conservative worldview.

Early Works

Posted in Asia as the Second World War began, Hersey's ambition to write substantive nonfiction surfaced with his first two books of reportage, *Men on Bataan* (1942) and *Into the Valley* (1943), which was a hybrid of reporting and memoir. Written while employed by *Time*, Hersey worked Herculean hours to make publishing deadlines. The stateside audience sought stories from Bataan and Guadalcanal—though fellow journalist Richard Tregaskis beat Hersey to the publishing punch; *Guadalcanal Diary* (1943) came out nearly a month before *Into the Valley*. Both of Hersey's books had been best sellers.

After a return to the states, Hersey was deployed to the European theater by *Time* and covered the assault on Italy. This time, he produced a work more substantial than his slim nonfiction books from the Pacific. As he reported for the magazine, he felt a growing fictional narrative inside drawn from his experiences. He produced *A Bell for Adano* (1944) quickly, producing what critic Diana Trilling called "our first fiction of the American government of Italy" (Treglown, 2019, p. 81).

The book was soon adapted for the Broadway stage and for film. Celebrated journalist Damon Runyon, then hospitalized and silenced by throat cancer, passed a note to one of his bedside visitors, *New York Post* columnist Leonard Lyons. "Do you know Hersey?" Runyon wrote. "He is the

best writer that has come out of the war so far" (Treglown, 2019, p. 88).

Journalist and Literary Figure

Hersey's reputation was growing and the warm reception for his first novel—which would win the Pulitzer Prize for Fiction in 1945—made him ponder his future in journalism. He was with *Time*, but was being courted by *The Saturday Evening Post*. However, if he wanted to write journalism and build a literary reputation, the publication that made the most sense for a professional alliance was *The New Yorker*.

Luce was dangling the prospect of a major job—maybe even *the* top job—at *Time*. Ben Hibbs, editor of the *Post*, wined and dined the writer and his wife. But it was Hersey's experience working with the celebrated editors at *The New Yorker* that helped make up his mind.

Hersey and his wife Frances Ann Cannon met with her old boyfriend, John Kennedy, in New York. Kennedy was back from the Pacific, where he had lost his command, PT-109, one of the small wooden patrol-torpedo (hence PT) boats in the South Pacific. Kennedy's craft was sunk, and he and his crew had made it to a nearby island, Kennedy towing an injured crewman using a rope through his teeth. It was a 3-mile swim in treacherous water and, sitting in a New York nightclub months later with Hersey and his former girlfriend, he shrugged off the accomplishment. Hersey, however, smelled a story. Kennedy was embarrassed by the episode—he had lost his boat, after all—but was willing to talk to Hersey for a story, as long as the reporter talked to all of the other survivors to get a fuller picture. Hersey tracked down the crew and got the story but found *Time* magazine disinterested. Hersey had earlier done a feature for *Life* about PT boats and Luce wanted something new.

So Hersey took the story to *The New Yorker*. One of its top editors, William Shawn, had been at the nightclub when Kennedy first unfurled the story to Hersey. Shawn impressed Hersey with his meticulous editing of "Survival," as the story was titled in the magazine. Not long afterward, when Kennedy's older brother Joseph Jr. was killed in a plane crash, father Joe, the family patriarch, seized upon "Survival" as the foundation for the

hero-narrative that would lead his second son to the U.S. presidency.

The experience working with such precise and careful professionals as Shawn and *The New Yorker* founding editor Harold Ross so impressed Hersey that he determined that magazine would be his new home. He withdrew from an exclusive relationship with Time-Life and foresaw a future as a novelist with ties to America's preeminent literary magazine.

The war ended in Europe and then in the Pacific, after the annihilation of two Japanese cities in August 1945. From the moment Hersey learned the horrifying news, he knew he wanted to write about the devastation. Although he still felt an allegiance to Time-Life and all that Luce had done for him, he knew that whatever he wrote about the use of atomic weapons for *Time*, the editors would pervert his article into a testament of American might. Telling this story for *The New Yorker* made more sense to Hersey. Luce put the full-court press on his protegee, telling Hersey it was time for him to step into management. To Hersey this made little sense, as he was becoming recognized not just as a journalist but as a literary figure. Nonetheless, Luce agreed to co-finance (with *The New Yorker*) a Hersey trip to China and Japan.

To make himself morally and contractually free, Hersey resigned from Time-Life immediately after the war ended, but there was an understanding that he would remain a contributor. Indeed, from China, he filed stories for both magazines. But he was on a trajectory for Japan and the aftermath of the bombing.

Hiroshima

On the journey from China to Japan, Hersey read Thornton Wilder's novel, *The Bridge of San Luis Rey* (1927). It told of six people, five of whom are killed when a rope bridge in the Andes collapses in 1714. The characters are all connected in some way. The sixth character, a priest, sees the tragedy and is left to muse on the nature of a God who would allow such a thing to happen. Hersey claimed that Wilder's book gave him the narrative structure he would use for the story he had not yet reported, the story of Hiroshima survivors.

He arrived in the decimated city in May 1946 and began interviewing somewhat indiscriminately.

He needed the six characters, and the first people he found were the Reverend Kiyoshi Tanimoto and Father Wilhelm Kleinsorge, a Jesuit from Germany. These two clergymen led him to others who would become Hersey's primary characters: a clerk, a widow, and two physicians. Whether his characters were a good demographic representative of the survivors was not the issue. They all had compelling stories.

In part to set up the drama—but also to fit into the methodical, slow-to-reveal style of *The New Yorker*—Hersey introduced them all in the first paragraph, dwelling on their names, not readily familiar to American readers: Toshiko Sasaki, a clerk; Masakazu Fujii, a physician; Hatsuyo Nakamura, a widow; Wilhelm Kleinsorge, a German priest; another physician, Terufumi Sasaki; and Kiyoshi Tanimoto, a minister.

Already a novelist, Hersey knew how to build dramatic tension. After introducing his characters, he crosscut between them as a screenwriter would, building tension. Although he was describing the most chaotic moments in human history, he wrote with detachment. Instead of instructing readers how to feel about the death and destruction, he presented the narrative in clinical language. He wrote of horrific events—of flesh slipping off of bone, of humans vaporizing . . . just disappearing—and yet never once did the language rise to the level of hysteria. His goal was not to insulate readers by feeling *for* them, but in forcing them to feel. Paradigms seemed to present themselves. For example, Toshiko Sasaki, the clerk, is saved when she turns her head from the window at the moment of the bomb's noiseless flash. She is thrown to the floor, and a bookcase collapses on top of her. To conclude the opening portion of the narrative, Hersey presents the young woman's plight to demonstrate the realities of the world that has just irrevocably changed. The bookcase right behind Sasaki collapses on top of her, horribly twisting her leg. The irony is not lost on Hersey. As he wrote at the end of the first segment of *Hiroshima*: "There, in the tin factory, in the first moment of the atomic age, a human being was being crushed by books."

Hersey wrote quickly, starting on the manuscript while returning from Japan by steamer. *The New Yorker* editors realized that to serialize the work

might dilute its impact or trivialize it. Ross and Shawn decided to make it the entire editorial content of the magazine's August 24, 1946, issue. It was published in book form that fall by Alfred A. Knopf and to date has never been out of print.

In 1999, New York University polled historians, educators, and journalists and the conclusion was that Hersey's *Hiroshima* was the greatest work of journalism in the 20th century.

Prolific Career

Hersey began a long and prolific career as a novelist. He revisited the key elements of his life, including the Second World War—*The Wall* (1950), about the Warsaw Ghetto; *The War Lover* (1959), about a pilot who thirsts for battle; the role of American missionaries in *The Call* (1985); and relations with Asia in *A Single Pebble* (1956) and *White Lotus* (1965). His occasional forays into journalism included *Aspects of the Presidency* (1980), in which Gerald Ford, his former football teammate, gave him unprecedented access to the White House.

His other major work of journalism was *The Algiers Motel Incident* (1968), which was—to borrow a marketing phrase from Truman Capote—a “nonfiction novel” about the killing of three young people during a racially charged riot in Detroit in 1967. Unlike *Hiroshima*, Hersey did not withhold his feelings about the injustice in the story and the killings, carried out by police.

Legacy and New Journalism

With *Hiroshima*, Hersey had created a template for the “new journalism” (or literary journalism) revolution that would be inaugurated in the 1960s. However, at the end of that decade, he felt that too many writers had played fast and loose with the facts. In “The Legend on the License,” which appeared in *The Yale Review* in 1986, Hersey took many practitioners of literary journalism to task—primarily Tom Wolfe, whose book on the space program, *The Right Stuff* (1979), had irked Hersey with its errors and inventions. The legend on the license—the imaginary license borne by journalists—was that “none of this is made up.” Hersey thought his descendants had gone too far.

Hersey divorced his first wife in 1958 and married Barbara Day Addams the following year. In addition to his writing career, he served as master of Pierson College at Yale and had five children. He died March 24, 1993, in Key West, Florida.

HOAXES

Several well-known anecdotes in journalism have their roots in hoaxes—those dubious, inventive, and diverting tales that have buffeted the news media from time to time over the decades. Prominent media hoaxes have included published reports about exotic life on the Moon, about an 8-year-old heroin addict in Washington, DC, and about a 15-year-old computer hacker turned extortionist.

Media hoaxes can be thought of as dramatic, outrageous, clever, or sensational inventions (Boese, 2002, p. 2). They are deliberate deceptions circulated, wittingly or otherwise, by news outlets

or propelled by digital media. Typically, they are calculated fabrications bearing familiar markers of legitimate news reports. In prominent cases, hoaxes have ruined reputations, brought upheaval to newsrooms, and lingered in the popular consciousness as reminders of media credulity and fallibility.

Hoaxes speak both to the gullibility and the guile of journalists, and several factors help explain their emergence. Eagerness for career advancement, lax supervisory oversight, competitive pressures, shoddy reporting techniques, and an inability to fulfill personal expectations are among the reasons. Hoaxes usually reside on the cusp of plausibility: They may seem extreme but are not so outlandish as to be unbelievable on their face.

This entry discusses several infamous hoaxes perpetrated by practitioners in radio, print, and digital media.

Janet Cooke's "Jimmy's World"

Probably no media hoax was more stunning or consequential than Janet Cooke's 2,250-word saga about an 8-year-old boy in Washington, DC, who supposedly was a third-generation heroin addict. Cooke's vivid but bogus report was published on the *Post's* front page in September 1980, beneath the headline, "Jimmy's World." It won a Pulitzer Prize for feature writing.

Cooke's story began this way:

Jimmy is 8 years old and a third generation heroin addict, a precocious little boy with sandy hair, velvety brown eyes and needle marks freckling the baby-smooth skin of his thin brown arms.

He nestles in a large, beige reclining chair in the living room of his comfortably furnished home in Southeast Washington. There is an almost cherubic expression on his small, round face as he talks about life—clothes, money, the Baltimore Orioles, and heroin. He has been an addict since the age of 5.

The story was immediately controversial. Local police mounted an extensive, citywide search for "Jimmy" that went on for 17 days. At one point,

the mayor announced, in error, that the boy was known to authorities and receiving medical treatment. But "Jimmy" was never found and, the mayor later said, "I've been told the story is part myth, part reality" (Green, 1981b).

The hoax of "Jimmy's World" might never have been unmasked had the *Post* not nominated Cooke's story for a Pulitzer Prize for Feature Writing. When it won, the Pulitzer committee released biographies of the award-winners. Cooke's contained details that were at odds with what a former employer, the *Toledo Blade*, knew about her educational and professional background. Among other discrepancies, Cooke claimed to have graduated magna cum laude from Vassar College. Vassar said she had attended classes there for a year.

She was grilled about the discrepancies by the *Post's* top editors, including Watergate legends Ben Bradlee and Bob Woodward, but insisted the "Jimmy's World" story was no hoax. Finally, when left alone with another editor, David Maraniss, Cooke confessed, saying, "There is no Jimmy and no family. It was a fabrication" (Green, 1981b). Cooke, then 26-years-old, resigned. The *Post* gave back the Pulitzer.

"For The Post, it was inexcusable," wrote Bill Green, the newspaper's ombudsman, noting that before publication, "none of the editors pressed Cooke for confidential details on the identity of 'Jimmy' or his family. Reporters with doubts about the story discussed their skepticism among themselves rather than taking it up the line to editors who might have taken action. Some Post staff members, however, did express suspicions to editors who weren't listening. While some reporters and editors were talking up their doubts, The *Post's* top news executives, unaware of newsroom anxieties, were nominating 'Jimmy's World' for journalism's highest award, the Pulitzer Prize" (Green, 1981a).

Spectacular hoaxes are rare but can be quite disruptive when discovered—as the separate cases of Jayson Blair of *The New York Times*, Stephen Glass of *The New Republic*, and Jack Kelley of *USA Today* all suggest.

Jayson Blair

Jayson Blair was a driven, substance-abusing young reporter for *The New York Times* who in 5

years moved from intern status to filling high-profile national desk assignments. In covering those events—which included the shootings by snipers who terrorized Washington, DC, in 2002—Blair fabricated or lifted material from other news outlets in at least three dozen stories. What the *Times* later called a “remarkable run of deceit” ended in the Spring 2003 when Blair, then 27, was found to have plagiarized portions of an article published in a Texas newspaper.

He resigned and the scope of his scandalous ways soon unfolded. An internal investigation at the *Times* determined that Blair had repeatedly “misled readers and Times colleagues with dispatches that purported to be from Maryland, Texas and other states, when often he was far away, in New York. He fabricated comments. He concocted scenes. He lifted material from other newspapers and wire services. He selected details from photographs to create the impression he had been somewhere or seen someone, when he had not” (Barry & et al, 2003, p. 1).

The *Times*’ most senior newsroom leaders, Executive Editor Howell Raines and Managing Editor Gerald Boyd, both of whom had boosted Blair’s short career, resigned 5 weeks after Blair quit the *Times*. In an interview several years after his fabrications were exposed, Blair said fear and anxiety about not fulfilling his expectations, and the expectations of others, led him to plagiarize and fabricate articles for the *Times*.

Stephen Glass

A few years before Blair’s unmasking, a rising star at *The New Republic* was found to have committed serial fabrication in what has been called “the most sustained fraud in the history of modern journalism” (Bissinger, 1998). The fabulist was Stephen Glass who in the late 1990s was celebrated at *The New Republic*—and in journalism circles in Washington, DC—for stories on edgy topics that brimmed with colorful detail, provocative quotes, and eccentric characters.

His was an astonishing rise to prominence. But his career collapsed swiftly after a reporter for what is now Forbes.com began questioning Glass’s article highlighting a 15-year-old computer hacker who extorted protection money from a California software company. The story, titled “Hack

Heaven,” was published in *The New Republic* in May 1998. It was a complete hoax.

In subsequent fact-checking, *The New Republic* found that 27 of 41 articles Glass had written for the magazine were fabricated, at least in part. One of them, published in April 1998, told of a convention in suburban Washington that sold knickknacks and memorabilia about Monica Lewinsky, a former intern whose affair with President Bill Clinton nearly cost him the White House. Among the purported items on display was an inflatable sex doll with the word *intern* across its chest.

Glass, who was 25 when unmasked, wrote bogus articles for *Harper’s* and other magazines. *Harper’s* later determined that much of Glass’s nearly 8000-word article in 1998 describing his experiences as a phone psychic was “based on fabrications.” *Harper’s* repudiated the story in what was the venerable magazine’s first-ever retraction.

Jack Kelley

Cooke, Blair, and Glass were rising or aspiring stars who became fabulists. All of them were in their 20s. By the time Jack Kelley’s serial fraud was exposed in 2004, he had climbed the ranks to become a well-regarded international reporter for *USA Today*. During his 21 years at the newspaper, Kelley’s editors had nominated his reporting for a Pulitzer Prize five times.

Kelley never won, but his entry was a finalist in 2002 for the award in beat reporting. Included in Kelley’s entry was a graphic account of a suicide bombing at a Jerusalem pizzeria in August 2001. The article contained the following passage, which later was found to be exaggerated:

Three men, who had been eating pizza inside, were catapulted out of the chairs they had been sitting on. When they hit the ground their heads separated from their bodies and rolled down the street.

No adult victims were decapitated in the attack, a subsequent review of Kelley’s work determined. The review, conducted by three outside journalists after a *USA Today* staff member submitted an anonymous complaint, also found that no fewer

than 20 of his stories contained fabrications and that at least 100 passages had been taken without attribution from other publications.

The evidence also “strongly contradicted Kelley’s published accounts that he spent a night with Egyptian terrorists in 1997,” that he had “watched a Pakistani student unfold a picture of the Sears Tower and say, ‘This one is mine,’ in 2001,” and that he had joined in “a high-speed hunt for Osama bin Laden in 2003,” *USA Today* reported (Morrison, 2004).

Kelley insisted he had not fabricated his reports. But evidence of his deceptions was compelling. He was 43 when he quit under pressure in early 2004. Karen Jurgensen, the editor, and Hal Ritter, the managing editor for news, resigned a few months later.

Claas Relotius

No two hoaxes are quite alike, but reminders of the Kelley case emerged years later in the fabrications of Claas Relotius, an award-winning reporter for Germany’s respected *Der Spiegel* newsmagazine. Some of his work bore a decidedly anti-American streak and included made-up stories such as the tale about a woman who criss-crossed the United States to attend executions of death-row criminals.

Another article for *Spiegel* presented a mostly fictitious report from Fergus Falls, Minnesota. Relotius had spent several weeks there, researching an article about small town life during the presidency of Donald Trump. His article in 2017 ran to more than 7,000 words and was studded with falsehoods. Among them was reference to a sign advising, “Mexicans Keep Out.” Another was that the town’s theater still showed the patriotic film *American Sniper* years after its release.

Many of the fictions could have been easily detected but perhaps because they reflected anti-American stereotypes, they eluded *Spiegel*’s fact-checking staff. “The biases that Relotius stoked in his stories,” argued a writer for the *Atlantic* who is familiar with Germany, “are ones that Europeans, and Germans in particular, have voiced about America” for many years. “Relotius told them what they wanted—what they expected—to hear about America” (Kirchick, 2019).

The fabrications came to light after another journalist made known his reservations about Relotius’s methods while collaborating on a prospective story about vigilantes near the U.S.-Mexico border in Arizona. Relotius, who was 33 when unmasked in 2018, conceded to making up portions of no fewer than 14 articles for *Der Spiegel*. He had fabricated “on a grand scale,” the magazine later conceded, describing the scandal as “a low point” in its 70-year history.

“Hitler Diaries”

The Relotius case brought to mind the sensational “Hitler Diaries” hoax of 1983, when Germany’s *Stern* magazine and the London Sunday Times began serializing portions of 60 volumes of diaries purportedly written by the Nazi leader before his suicide in 1945. The diaries had been pronounced genuine by British historian Hugh Trevor-Roper but soon were found to be crude fakes, written on paper made after World War II.

A German dealer in Nazi memorabilia was accused of forging the diaries and went to jail for fraud. So did the German reporter to whom *Stern* gave \$3.1 million to acquire the journals. He claimed they had been retrieved from a barn in East Germany.

“A Gay Girl in Damascus”

The Internet can be a fertile place for hoaxes, as the case of “A Gay Girl in Damascus” demonstrates. “Gay Girl” was a web log supposedly written by Amina Abdallah Arraf, a 25-year-old Syrian-American lesbian. The blog’s postings purported to document Amina’s social life in Syria and her anti-regime views.

“Gay Girl” gained an international following during a 4-month run in 2011 before it was found to be the creation of Tom MacMaster, a 40-year-old married man from Georgia. He was studying in Scotland for a master’s degree. MacMaster’s hoax unraveled soon after he posted word that Arraf had been taken captive by men believed linked to the regime of President Bashar al-Assad. The news sparked an international outcry which, after a few days, gave rise to suspicions about the veracity of the site’s content.

MacMaster said he created “Gay Girl,” and Arraf, as a roundabout way of expressing his views about Syria. “I found that when I argued, debated and made points that I knew to be factually sound on issues relating to Middle East by myself, I got pushback,” he told *The Washington Post*, which was instrumental in his unmasking (Flock & Bell, 2011).

“It started as a casual thing, but it steadily grew,” he said of his hoax, adding, “I always knew that it was a role playing game for me. I just never expected it to get so out of hand” (Flock & Bell, 2011).

Orson Welles’s *The War of the Worlds*

Occasionally, a notable media moment is remembered as a hoax even if it was not necessarily intended as deception. A classic example is the radio dramatization of *The War of the Worlds*. The program aired over CBS Radio on the eve of Halloween in 1938 and made clever use of simulated but urgent-sounding news bulletins that said Martians wielding deadly heat rays were invading Earth. Ground zero for the attack was a hamlet in central New Jersey, near Princeton.

Orson Welles, the program’s 23-year-old director and star, had minimized disclaimers during the program but denied he meant to terrify listeners. At a news conference the morning after the broadcast, Welles said it was unfathomable anyone could have mistaken the broadcast for an alien invasion.

By then, a tenacious media myth was beginning to take hold: The radio show had incited nationwide panic and mass hysteria. This erroneous notion was promoted by newspapers eager to chastise radio—the new media of the day—as unreliable and prone to sensationalism. Newspaper headlines across the country told of terror and panic caused by Welles’s show. But evidence for such characterizations was exceedingly thin, and media scholars now reject the notion the program set off anything akin to mass panic or hysteria (Pooley & Sokolow, 2013). Available evidence about the show’s audience indicates that most listeners recognized it for what it was—imaginative entertainment on the radio.

Welles’s show is recalled in the United States at Halloween every year. It also was recalled in

Belgium in December 2006, when RTBF, the country’s public television station, reported the abrupt dissolution of the linguistically divided country and the abdication of its royal family. RTBF broadcast blurry footage purportedly showing the king and queen leaving the country. Flanders, the Dutch-speaking northern half of the country, was reported to have proclaimed independence.

It was a hoax, “done up to look as authentic as possible, complete with real reporters conducting live interviews with real politicians about the imaginary news,” *The New York Times* reported (Bilefsky, 2006). RTBF said the report was intended to provoke debate about the future of the majority French-speaking country. The prime minister’s spokesman was little amused, however. “It’s very bad Orson Welles,” he was quoted as saying.

The Great Moon Hoax

The hoax best remembered across the decades is perhaps *The New York Sun*’s six-part series in August 1835 about intelligent life on the Moon. The sensational stories, ostensibly excerpts from the defunct Edinburgh *Journal of Science*, described man-bats and other exotic lifeforms supposedly flourishing on the Moon. Authorship of what is called the *Great Moon Hoax* has been attributed to the newspaper’s editor, Richard Adams Locke. It is impossible to say how credulously the articles were received at the time, but the *Sun* embellished so lavishly that suspicion lingers that it was less a hoax and more a case of satire done too well. István Kornél Vida offered that interpretation several years ago, writing that Locke probably did not intend to perpetrate a hoax but to mock claims of the time that life flourished elsewhere in the solar system. “His satire failed not because it was bad,” Vida argued, “but because it was too good” (Vida, 2012, p. 439).

HUMAN-INTEREST JOURNALISM

Human-interest journalism deals primarily with ordinary people who have experienced some sort of emotional drama the audience can relate to. Human-interest journalism is part of what is often labeled soft news, a form of journalism that deals primarily with emotional storytelling, entertainment, ordinary people, and everyday life. Soft news, and thereby human-interest journalism, is traditionally contrasted by the fact-centered and objectivity-driven hard news coverage of current affairs, related to topics like politics, international affairs, the economy, and science.

This entry presents the origin of human-interest journalism, the various forms it has taken in print, broadcast and online media, and discusses the critique and defense of such journalism. Human-interest journalism has broadened the scope of journalism beyond politics and current affairs and contributed to making individuals, emotions, and the personal part of public discourse. This process started with the printed press and escalated in broadcast journalism especially in commercial news networks and later in online media. Some scholars argue this development has increased the public's interest in politics and current affairs, while others argue it has trivialized public discourse and rendered journalism irrelevant.

The Origin of Human-Interest Journalism

In *News and the Human Interest Story*, first published in 1940, Helen MacGill Hughes argues that human-interest journalism emerged as a vital ingredient in the commercialization of the press, starting with the penny press in the United States in the 1830s. The discovery and exploitation of human interest made newspapers relevant to the general public and not only elites, thereby contributing to a huge increase in circulation and sales of newspapers, according to Hughes. The term “human-interest” was first used in *The New York Sun* (established in 1833) to describe short accounts of tragic or comic happenings in the lives of ordinary people.

The initial purpose of human-interest stories was to provide entertainment. However, they had a deeper social function as they embedded normative ideals of good and bad, wanted and unwanted social conduct. In her analysis, Hughes shows how human-interest stories often were based in core emotions like passion, betrayal, loyalty, and ambition and established moral order and guidelines for how such emotions should be handled by the individual in socially acceptable ways. As such, early human-interest stories shared genre attributes with the folklore and ballads of previous times, which also established moral order and guidelines for social behavior.

During the yellow press era in the United States starting at the end of the 19th century and later eras of tabloid journalism in both the United States and Europe, the emphasis on the individual, personal, emotional, and morality embedded in the early human-interest stories spilled over to other areas of journalism. The so-called newspaper war between Joseph Pulitzer’s *New York World* and William R. Hearst’s *New York Journal* was key to this development, as the competition between the two newspapers caused increased use of sensationalist reporting emphasizing emotions and moral conduct of individuals related to, for instance, crime reporting and politics. This development was further escalated with the so-called muckraker journalism at the beginning of the 20th century in the United States, in which the personal lives and moral conducts of the elite were scrutinized, resulting in several public

scandals involving high-profile politicians and businessmen.

In its initial phase, human interest journalism was an integrated part of the general news in newspapers. It was not until newspapers were sectioned and objectivity became a dominant norm in news reporting in U.S. journalism at the beginning of the 20th century and later in Europe that the hard news/soft news dichotomy was established, and human-interest journalism was separated from other forms of news. The hard news/soft news divide meant that detached, facts-based news on politics and current affairs were placed in separate sections of the newspapers, while human-interest stories and other soft news were sectioned elsewhere.

Types of Human-Interest Journalism

Human-interest journalism has developed in many directions beyond the original short stories related to ordinary peoples’ dramatic and emotional experiences. One important development is related to feature journalism or feature writing in the United States and reportage journalism in Europe, which both developed as genres in which the journalists themselves exhibited personal and emotional behavior in their writing. Feature stories and reportages are human interest genres in two respects: (1) They are often concerned with experiences of ordinary people, just like other human-interest stories, and (2) they establish intersubjective connections between the writer and the reader through personal, subjective language and/or inclusion of the writer’s own experiences and observations. Many well-known fiction authors in both Europe and the United States have doubled as feature writers or reportage journalists for newspapers and magazines. Examples include August Strindberg, Knut Hamsun, Emile Zola, and Ernest Hemingway. This direction of human-interest journalism was further developed during the new journalism era in the United States in the 1960s and in later forms of literary or narrative journalism in many journalistic cultures around the world.

A second direction can be found in profiles. A profile is a journalistic genre that aims at capturing the person behind the public persona and giving the audience a glimpse of this person’s private

life. Public figures like politicians, successful entrepreneurs, businessmen, and celebrities are common subjects of profiles. Joseph Pulitzer made profiles an important ingredient of the *New York World* during the newspaper war at the end of the 19th century and instructed his journalists to paint vivid pictures of their profile subjects' domestic, private life, including their wives, children, and pets. The development of profiles in U.S. journalism is strongly connected to the rise of celebrity culture, while profiles in Europe find its origin as much in an interest in the lives of ordinary people.

A third direction of human-interest journalism can be labeled case-driven journalism, in which a hard news topic is exemplified with a case, typically an ordinary citizen who is affected by the hard news topic. This could, for instance, be pictures and interviews with someone who is affected by a natural disaster, a war, or similar current events, or it could be a story on how new economic policies, new legislations, or similar current affairs affect an ordinary family. Such human-interest stories serve as cases that illustrate a general phenomenon, and they can be published as separate stories or as integrated parts of a longer story on the general phenomenon in question. Such human-interest stories are therefore a reporting strategy more than a specific genre of journalism. Case-driven human-interest journalism was an important part of the tabloidization of journalism during the 20th century in both the United States and in Europe. A fourth direction, which was also important to the tabloidization of journalism, can be found in broadcast journalism, especially in commercial news networks, which started to use human-interest stories in their programming to provide the audience with entertaining and upbeat endings to their news casts. Such short human-interest stories typically involve ordinary people whom the audience can connect with, and they are produced with the aim of making newscasts more popular and less focused on problems and conflicts.

Online and social media have introduced additional directions for human-interest journalism. The utilization of user-generated content in the form of, for instance, audience comments to news stories or armature images in online newspapers provided new avenues to include personal

experiences of ordinary citizens in news coverage. The rise of practices like citizen journalism have had similar effects. Blogs and social media have also provided journalists with new platforms to not only publish and distribute journalism but also to express themselves in more subjective and personal ways. Moreover, software and tools to measure audience behavior and engagement with news have provided newsrooms with sophisticated ways of monitoring and analyzing what their audiences are interested in. This development has made journalism more aware of the wants and needs of audiences, and newsroom priorities are to an even greater extent than before organized around catering to these wants and needs as they are expressed through audience metrics. This development means that human-interest has become a strategy as much as a form of journalism in modern, digitized newsrooms.

Critique of Human-Interest Journalism

Human-interest news has often been portrayed as a form of journalism that ruined "proper" journalism because of its emphasis on ordinary people, emotions, and personal affairs instead of politics and other current affairs of perceived public interest. From the 1970s and onward, when commercial television diffused in the United States and Europe and newspapers had to adapt their news production to the new competition, scholars increasingly argued that editors and journalists sacrificed their mission of reporting on topics of public interest and instead became preoccupied with catering to the wants and needs of the public. Such critique was linked to the rise of tabloid, commercial, and popular journalism, in which human interest news was—and still is—a key ingredient. A notable example of such critique can be found in Bob Franklin's 1997 book *Newzak and News Media*, in which the author argues that the commercialization of journalism had led to increased emphasis on sensational reporting, scandals, personalization, and emotions, all of which were masked and defended by the industry as human-interest stories, and which, according to the author, resulted in a "dumbing down" of journalism. Consequently, journalism failed at addressing the deeper, structural layers of societies, according to Franklin and other critics. Topics like

climate change, poverty, war, international affairs, culture, and the economy would either be deprioritized because they are difficult to cover with a human-interest angle, or they would be reduced to individualized anecdotes, said the critics.

Critics also argued that with an increased emphasis on human interest, journalism diverted attention away from politics and other matters of public interest over to lifestyle and leisure issues, consumer interests, celebrities, and entertainment. An early and seminal example of such critique can be found in Neil Postman's 1985 book *Amusing Ourselves to Death*, in which the author argued that the news, especially broadcasted news, had been reduced to entertainment programming that could no longer be taken seriously. Moreover, journalistic coverage of politics were no longer about political ideas and arguments, but about the personalities of politicians, according to Postman and other critics. In more recent years, after the popularization of the world wide web and the changes to media markets and financial structures of journalism caused in part by the rise of global enterprises like Facebook, Google, Amazon, and others, critics have argued that journalism has become even more dependent on exploiting human interest news to sustain commercial success. The result has been a crisis in journalism in many countries, in which critics argue that journalism has left its societal mission of critical, independent reporting on current affairs to an even greater extent.

Defense of Human-Interest Journalism

The critique of human-interest journalism stands in stark contrast to how this form of journalism has been portrayed by, for instance, authors of handbooks on journalism and in more practice and audience-oriented research. Such scholars often portray human-interest as a form of news that made journalism more aware of what interested the public instead of just being based on elitists notions of what the audience *should* be interested in. In her 1940 book, Hughes argued that adding human-interest stories became a way of introducing journalism and news to people who otherwise would not be interested. As such, human interest stories taught people to read newspapers, according to Hughes. Others have argued

that adding a human-interest angle increases journalism's relevance, since people connect better with topics if the journalistic coverage contains a personal or emotional dimension that resonates with their own lives. This argument has been central to journalists' defense of human-interest journalism from the 19th century until today. A typical example can be found in former *Washington Post* journalist Walt Harrington's 1997 book *Intimate Journalism*, in which the author advocates for more reporting on everyday life in journalism because it "preserves journalistic integrity, expands the report, connects readers emotionally to their newspaper and makes journalists seem less like the unfeeling, uncaring hit men many people wrongly believe them to be" (p. XIV).

Moreover, journalists and scholars alike stress that human-interest stories and human-interest angles have increased the diversity of journalism, both related to the types of stories and topics covered, and by the sources used and voiced heard through journalism. Since human-interest stories often give voice to ordinary citizens, it may contribute to counterbalancing the perspectives offered by elite sources and thereby enhancing a diversified public sphere and creating greater opportunities for participatory democracy. Other scholars have argued that human-interest journalism, with its emphasis on personal narratives, morality, and guidelines for social behavior, create social cohesion which in turn might strengthen feelings of connectivity and social belonging.

Final Thoughts

Human-interest journalism has been a central part of journalism since the early 19th century. It was a key ingredient in the popularization of the press, as it connected news to ordinary people on an emotional and personal level. Human-interest journalism has expanded the formats, topics, sources, audiences, and practitioners of journalism beyond the domains of politics and the elites. It has been, and still is, of great importance to the commercial success of journalism in print, broadcast, and online media. Critics, on one hand, argue that human-interest journalism has turned journalism into entertainment and thereby undermined its core social function of providing people with the information they need in order to

perform democratic citizenship. The defenders of human-interest journalism, on the other hand, argue that this form of journalism has enhanced democratic diversity and participation, since more people get involved with journalism as both participants and audiences.

Scholars have also pointed to the fact that the assumed divide between hard and soft news does not withstand the test of empirical investigations. Hard news increasingly includes soft news elements and vice versa. Human-interest and emotions are often key ingredients in both award-winning pieces of investigative journalism and everyday reporting on matters of public interest. Furthermore, journalists and editors tend to view journalism on current affairs—be it on politics, the economy, foreign affairs, science, or other topics traditionally classified as belonging to the hard news domain—that does not manage to connect to audiences through a human-interest angle, as unsuccessful reporting. Much of what is considered good journalism today is therefore a mixture of hard news and human-interest elements, thereby rendering the hard/soft news dichotomy an unprecise description of journalistic formats.

HUMAN RIGHTS AND JOURNALISM

Journalism is a prime beneficiary of the human rights system that was established globally after World War II. Meanwhile, freedom of the press (or media freedom) is considered to be a cornerstone of all other human rights, as it enables their very possibility by providing a platform to defend their existence and flourishing. Journalism empowers citizens to criticize flaws in the implementation of human rights and make their demands to have the rights protect the public.

Although derived from the fundamental human right of freedom of expression, freedom of the media has become—at least in international affairs—a human right of its own. It remains the most important and visible manifestation of the right to free expression. There are particular reasons for the universal protection to freely exercise journalism. The dominant approach in explaining special guarantees for media freedom is based on an axiomatic argument that it is a condition for the press to play its inherent role of a public watchdog to take its influential place as the Fourth Estate. It thus contributes to the democratic process and the protection of all human rights through disseminating information and ideas on political issues and other issues of public

interest. Such information and ideas facilitate understanding issues relevant to democracy and empower citizens' participation in political life.

Journalism largely shapes the way that the public comes to understand current developments surrounding human rights. There are numerous examples of reporters, often at a risk to their lives and well-being, exposing fraud and abuse of power, and spotlighting discrimination, slavery, election-rigging, and arbitrary arrests, among others. Such stories, once known to the wider public, set the stage for redress of human rights violations and holding the powers that be accountable. At the same time, journalism, no matter how free, independent, and pluralistic it is, remains an empty word if other human rights, such as that of liberty, equality before the law, freedom of association, or the right to take part in the conduct of public affairs, among others, are not respected.

This entry examines the significance of human rights journalism, the challenges associated with reporting on human rights issues, the rise of citizen journalism, and journalists' ongoing role as human rights defenders (HRDs).

Significance of Human Rights in the Contemporary World

Human rights embody the dignity, equality, and the worth of the individual. Globally, the recognition of human rights is the product of the victory of the Allies in World War II. The United Nations (UN), which was established in 1945, then noted that the war was caused, in particular, by the gross violations of human rights by the aggressor states. Therefore, it was decided that a set of shared fundamental human rights should lie at the foundation of the postwar system of the international order.

At first, such rights were formulated and enshrined in the Universal Declaration of Human Rights (UDHR, 1948). Then, following long discussions, these standards were further promoted in binding treaties, both at regional and UN level. First and foremost, they are the International Covenant on Civil and Political Rights (ICCPR) and the International Covenant on Economic, Social, and Cultural Rights, which both entered into force in 1976. Of great importance for the

post-Cold War understanding of the role of human rights is the Vienna Declaration and Programme of Action adopted by the World Conference on Human Rights in 1993. Taken together, these acts have established an international order intended to limit the ability of rulers to violate, or allow others to violate, human rights of their fellow citizens.

This order, in particular, means that observance of human rights is a matter of direct and legitimate concern to all states and does not belong exclusively to the internal affairs of the state concerned. All human rights are supposed to be treated in a fair and equal manner, on the same footing, and with the same emphasis. While the significance of national and regional particularities and various historical, cultural, and religious backgrounds may be borne in mind, it is the duty of states, regardless of their political, economic, and cultural systems, to promote and protect all human rights and fundamental freedoms.

All human rights and fundamental freedoms are universal, inalienable, indivisible, interdependent, and interrelated. They also mutually reinforce democracy and development.

Journalism as Free Expression and Communication

Journalism can be seen as a skill, a talent, or a passion to pursue the truth and to inform others, using modern mass communication technologies, so as to empower the public with knowledge on matters of societal interest and facilitate access to information and ideas. In this sense, by the start of the 21st century, journalism has transformed from a profession to a function of disseminating information of public interest to a mass audience. While some commentators claim that this role has gradually diminished, it remains generally recognized. Other scholars also point to the need for stronger quality and accountability in journalism, linking it, in particular, with the requirements to better inform the public on matters of public interest and to contribute to the plurality of ideas.

Journalism is also a form of free expression, which itself is a fundamental human right. Journalists benefit from freedom of the media, freedom of information, and the overarching right to freedom of expression, enshrined under Article 19

of the UDHR and Article 19 of the ICCPR. Hence comes the vested interest of journalists to protect and promote the human rights order.

With the end of the Cold War and the appearance of modern technologies came international recognition of the new status of freedom of the media in relation to freedom of expression and freedom of information. Freedom of the media was raised to the level of a fundamental human right of its own significance, which has developed beyond the more traditional scope of freedom of expression. As in the case of other internationally recognized human rights, states have an obligation not just to observe, but also to enable and advance this freedom.

It is widely held that journalism allows the exercise of freedom of the media to be in conflict with other human rights, most often, the right to privacy. A popular case to illustrate such a conflict is the 2011 scandal with the News Group Newspapers company in the United Kingdom. It was caused by illegal hacking of telephones in the pursuit of stories by reckless and intrusive media company executives, editors, and reporters. Consistent investigative reporting by the journalists of *The Guardian* daily originally met with denials from the media company, finally led to a public outcry, resulting in a number of resignations among the executives and reporters from the News Group Newspapers, as well as in a police investigation, together with a parliamentary and a formal government inquiry. Once the evidence was disclosed that several outlets of the media company were involved in phone hacking, including the phone of a murdered teenager, and that journalists bribed police for information, criminal charges were brought against the offenders. This all led to the closure of one of Europe's best-selling weeklies, *News of the World*, after 168 years in print, and the demise of the national media self-regulation body, the Press Complaint Commission, that had failed to properly address the issue.

Although such cases do happen in the journalistic practice, generally speaking, interaction of freedom of expression with other rights is rather instrumental for coherent understanding, consistent interpretation, and wider implementation of the latter. It happens when journalism builds a sense of populations being human-rights holders.

Reporting Human Rights

Evidence suggests that there is a growing news interest in human rights since the early 2000s. Human rights issues have become news in their own right, as the human rights angle gained legitimacy in the newsrooms to bring various types of stories. The news media initiate and follow public and policy debates by raising awareness and interpreting individual human rights cases as issues for the public at large, generating empathy for the victims of abuses, forming public opinion that will demand the authorities to take remedial actions, to be, in their turn, duly reported on by journalists. Journalism increasingly approaches issues of asylum and migration, terrorism, health care, education, and social services in the human rights context.

In line with the general understanding of criteria for newsworthiness, Howard Tumber and Silvio Waisbord consider that human rights and their violations generally make headlines when the following conditions are met: (1) those affected are individual political and legal rights, (2) events relate to armed conflicts, (3) large-scale abuses are perpetrated, (4) there is easy access to sources and victims, (5) powerful players and geopolitical forces are stakeholders in amplifying public awareness, (6) better-off and urban populations are primarily affected, and (7) local and international organizations are active in gaining media attention. Consequently, under other circumstances, a range of otherwise relevant issues are likely to be downsized or even absent in the news media.

Like with many other topics that journalists cover, there are solid grounds to criticize the media for lack of accuracy, knowledge, and understanding of the human rights issues being reported on. Research conducted by the International Council on Human Rights Policy pointed to the following three areas of concern: (1) inadequate understanding by journalists of human rights law and existing mechanisms; (2) inadequate attention given to human rights as a dimension and category in domestic stories, such as on child abuse, refugees, unemployment, sexual, or racial discrimination; and (3) lack of historical, political, social, and/or local context in human rights stories, even when there is no urgency in their

reporting and there is time for journalists to develop such a context.

Public service media (PSM), while conceptually not necessarily designed to facilitate human rights, significantly contribute to their full enjoyment in society, primarily freedom of expression, but also the right to education, the right to freedom of association, and the right to public participation. PSM and community media contribute to protecting human rights by providing platforms for the diverse voices in society, in particular, those populations that may otherwise be marginalized or “forgotten,” thus heeding its strong voice for equal rights for all.

Attempts to limit the role of the media as a public watchdog endanger human rights in general. In authoritarian countries, journalists may not report on occurrences of human rights violations “at home.” Critical voices are stifled with oppressive criminal defamation and national security laws, intimidation of independent journalists, and/or governmental control of dominant news outlets.

Citizen Journalism and Human Rights

Today, journalism as it has been known for centuries is in crisis, which is caused by technological changes that weaken its traditional sources of revenue. Citizen journalism, a new phenomenon, fills the gap caused by the lack of professional journalism, a result of drastic staff cuts in news outlets, in particular the elimination of overseas bureaus and local correspondents. The gap—under other circumstances—would limit the scope of around-the-globe coverage on human rights and make it possible for their numerous violations to go unreported.

However, as technologies that were once exclusively used by a limited number of professional journalists become widely available, millions all over the world, usually without formal journalism skills, step forward to play an important role in the gathering and dissemination of information essential for the exposure of human rights violations.

Citizen journalists readily report from zones of military conflict or unrest, that are often inaccessible to conventional journalists, or where authorities or other parties involved in the conflicts specifically target professional journalists. Their

reports, often in the form of videos and other images, are then sent to social networks and/or the media, often with the aim of serving as proof of violations of human rights, including rights of the press. They are professionally assessed in newsrooms for accuracy before being further disseminated through news channels. Bloggers, additionally, raise topics of human rights abuses and attract popular support, when, for example, they call for public accountability of officials. Questions are often asked however of the quality of journalism produced by nonprofessionals and their observance of basic ethical standards.

Through blogs and social network channels, such as Telegram, citizen journalists reported on the mass rallies and marches that erupted in Belarus following the announcement of the results of the presidential elections in August 2020. Their images and other accounts chronicled systematic violations by the secret services and the police of the human rights to peaceful assembly, dignity, and freedom of expression and association.

Because of the potential impact that citizen journalists can have by reporting on human rights violations, those individuals are often threatened and attacked in an attempt to silence their critical voices.

Journalists as HRDs

The press, though generally not considered to be a public institution, performs an essential function of serving the general public. It has the power to publicize and prompt debates on the issues of societal concern. Freedom of the media, at least in Europe, presumes and even requires certain public services on behalf of journalists, by expecting them to play a watchdog role. In return, European law provides a protective requirement for any limitations on free speech to be “necessary in a democratic society.”

Although the professional activity of many journalists does not involve human rights work all the time, it occasionally links to the defense of human rights, most often the right to free expression and free media. In this regard, journalists and other media workers can be considered as HRDs when, through their reporting, they promote human rights in general and/or strive to protect the rights of others by raising public awareness. This happens

when journalists report on war-time atrocities, environmental issues, corruption, torture, impunity of perpetrators of crimes, human trafficking, migration, or forced evictions. Quite often, journalists consider themselves to have a moral obligation to report on these issues from a pro-human rights perspective.

The Declaration on HRDs (adopted by a UN General Assembly resolution in 1999) underlines the right of everyone to have access to information as to how human rights and freedoms are given effect in national systems, to seek and disseminate relevant views, information, and knowledge, to study and discuss opinions on their observance, both in law and in practice, as well as to draw public attention to those matters.

There is a significant overlap between groups of journalists and HRDs. When the latter report on social media and disseminate online appeals, they can as well be classified as journalists. This should allow them to claim and benefit from the protection mechanisms that traditionally apply to journalists.

Many journalists join civil society organizations, advocating for the rights of certain groups of people, such as vulnerable minorities, and make their democratic activism publicly known. As a result, there is a certain dissolution of the distinction between journalism and activism with regard to human rights violations, seemingly undermining integrity of the journalists. A closer look at this phenomenon allows claiming that such committed journalism in favor of human rights does not contradict professional standards but rather underscores them.

HYPERLOCAL JOURNALISM

Since the early 2000s, the practice of hyperlocal journalism has emerged from the informal, community, experimental, amateur edges of journalism practice to become significant in discussions of the future of the local and regional press. In countries with a market failure in the provision of local news, hyperlocal journalism has been viewed as a possible way to fill the gap and carry out the important roles of holding local power to account and bringing communities together.

With such hope invested in hyperlocal journalism, one might expect it to be easy to identify precisely what it is and what makes it such a powerful contender to solve critical issues of the future of local news. However, the reality is that a very wide set of practices and contexts are encompassed in the term. This entry discusses the defining characteristics of hyperlocal journalism, aspects that have been the focus of researchers as they study the value of the form and future possibilities for hyperlocal journalism.

Defining Characteristics

“Local” can mean different things to different people depending on where they live. For

communities living dispersed in rural areas, local may be a term used to refer to someone living 50 kilometers away. Thus, a local newspaper in some parts of the world could cover a large geographic area. In contrast, a city might have local titles that cover the entire city, or if it was a big city, local titles that covered specific groups of neighborhoods.

In the United Kingdom, a distinction made between the regional press (often covering more than one city or county) and the local press (usually confined to one city). In broadcasting, the use of local is often dictated by the footprint of transmission technologies, which often ignore political boundaries between regions. When considering hyperlocal journalism in geographic terms, one would expect the localities being covered by a hyperlocal newspaper to be smaller than those covered by a local newspaper. Many hyperlocals cover single villages or postal code areas and research in the United Kingdom has noted how many have emerged in small towns that have lost their mainstream local newspaper through closure.

The geographic has not been seen as the only defining aspect of hyperlocal journalism. Writing just as the term was gaining wider currency in 2011, Emily Metzgar and colleagues argued that being community-oriented and independent marked hyperlocals out just as much as their focus on place. Further, these were operations that were indigenous to the web and motivated to do original reporting by filling gaps in existing mainstream coverage in order to promote civic engagement. Kristy Hess and Lisa Waller, writing in 2016 and reflecting on the emerging research into the field, laud the civic intent behind the hyperlocal movement, noting that what drives those creating extremely local news is an authentic desire to champion place and develop social bonds between citizens.

Hyperlocal is more a subcultural practice than it is a journalistic one, not so much driven by journalistic norms, but cultural ones. It's not burdened by overheads or company debt but is lightweight in operation, often staffed by volunteers driven by a desire to champion their "patch" and defend it from the sometimes-negative gaze of the mainstream. Reputational geographies are at stake and hyperlocal journalists know which side they're on.

Examining the Value of Hyperlocal Journalism

Issues of place-making and community have occupied the focus of much scholarly work in the field. Within the wide range of experiments and approaches to hyperlocal journalism in different territories, there seems to be a hope that a model that points to a community-led future for local news might emerge. Research has been focused on understanding the value of the form in three ways. Firstly, as a participatory space for citizens to engage in news creation and circulation. Secondly, as an alternative public sphere of communication that could offer a genuine challenge to mainstream news production that many have argued has become debased through cutbacks, reliant on clickbait news to drive traffic to its ad-heavy websites. Thirdly, as a space for enterprise through which new business models for sustainable public service news might develop.

Citizen Participation

In the late 1990s and early 2000s, something of a utopian discourse emerged about the potential of the internet to give voice to ordinary people via blogs and emerging social media platforms. Dan Gillmor, in his influential 2004 book *We the Media*, makes the connection between the alternative radical press of the late 18th century and what seemed like an inexorable rise of bloggers and citizen journalists in the early 21st century. In each case, people turned to the latest technology to find wider audiences for personal concerns and citizens shifted from consumers to users of news. Into this vibrant networked public sphere came those who focused on everyday local, and indeed hyperlocal, issues. The hyperlocal journalism on these websites often elevated ordinary and seemingly insignificant events to the level of news. This banal content that so often features in hyperlocal journalism presented something of a challenge to established ideas of what news is.

Research in the United Kingdom saw how such everyday stories were often the most reshared and liked on social media: lost pets, the opening and closing of shops, minor traffic holdups, the activities of small community groups, requests for recommendations of tradespeople, and a host of other seemingly trivial news items. Content

focused on local politics and other formal civic matters were often covered but rarely got the same levels of engagement.

Hyperlocal journalists drew on well-established, but perhaps no longer affordable, journalistic practices such as walking a “beat.” In research by David Harte and colleagues in the United Kingdom, journalists mentioned working from local pubs and cafes and building up relationships in order to find a steady supply of news items. These relationships have been theorized as being reciprocal in nature. At one level, there’s a direct exchange of information from audience to producer but in a more developed, sustained reciprocal relationship audience members becomes networked nodes themselves, using social media to not just exchange information but to act on it and create real-world impact in their communities.

An Alternative Public Sphere

If the potential for developed citizen participation was a key aspect of hyperlocal journalism, then so too was the sense that what was emerging was a renaissance in the radical alternative local press; or at the least, the development of alternative local information ecologies. Radical and alternative news has always been a feature of the news landscape and has been the focus of much research. Counterculture movements in the United States and Western Europe in the 1960s and 1970s saw a flourishing of radical magazines and newspapers, many focused on local communities. Offset lithographic printing had become widespread and relatively cheap by the early 1960s, placing it within financial reach of community and small political groups. Hyperlocal journalism may not share the radical, alternative edge of some of the content of these publications, but they do share a similar resistance to established production hierarchies and in their positioning of citizens as participants.

Tony Harcup has outlined how the alternative local press of the 1970s, in the United Kingdom at least, operated as something akin to an alternative public sphere, engaged in a hegemonic struggle with a homogenized public sphere where news services act in the interests of big business and elites rather than ordinary citizens. Hyperlocal journalism, as much as other alternative journalism movements, can offer alternative ways of seeing,

against which mainstream media can be judged. The ability for audiences to see their everyday lives and places reflected back to them in hyperlocal journalism is itself something of a radical act, given that mainstream local journalism is either absent or no longer sufficiently local.

Enterprise and Innovation

Without a doubt, hyperlocal journalism has become a lively space to develop new models of journalism enterprise. The wide range of models used to sustain fledgling publishing operations have included the purely volunteer-led, crowd-funding, co-operative-based, profit-focused, or grant-funded. Forms of subsidy for hyperlocal journalism have been central to its sustainability to date and have come largely via the provision of free labor or philanthropic grant funding. Some government-funded initiatives have supported experimentation in the hyperlocal sector in the hope of finding a solution that would support other market entrants. Success has been mixed and the attitudes of hyperlocal publishers to financial sustainability has been variable, with some welcoming the market opportunity that presents itself as the mainstream press retreat from the local advertising market, while others offer vociferous resistance to any form of income generation, rejecting in particular established advertising-based funding models. They seek instead to operate within a civic discourse that situates them as public servants more than news entrepreneurs and this, as much as anything, has raised issues about long-term sustainability of these hyperlocal news operations.

Yet hyperlocal journalism isn’t simply the preserve of the small-scale entrepreneur or not-for-profit sector. There has been a move from the term being solely used to describe citizen-led, place-based news services to becoming a description of a market opportunity which has attracted the interests of large news corporations. With falling print circulations, the newspaper industry has attempted to develop novel digital products to appeal to readers who no longer purchase printed newspapers. These services have been geared at trying to reclaim advertising funding that has been drifting from the sector since the beginning of the 21st century. Their success has been variable with some closing due to overreliance on citizen

journalism contributions, while others have been little more than rebadged versions of existing content or curated material from social media.

One newspaper executive described in 2013 how their hyperlocal platform, rolled out across towns and villages in the United Kingdom, would primarily be about “harvesting” content rather than creating original news stories. Technology companies have also entered the hyperlocal market, spotting the chance to compete with these news companies for local advertising income, creating products that make the most of the geo-locative affordances of mobile phones. Here too though success has been limited with Hess and Waller putting the failure of commercial operations down to a misunderstanding of what makes more amateur operations a success. That is, sustainability comes from the enjoyment of being at the margins, from participating in a cultural activity as much as it comes from producing news content.

Hyperlocal Possibilities

Hyperlocal has become something of an umbrella term to describe a range of mainstream and non-mainstream news operations. What they have in common is the belief that there’s still value to be had in engaging people in news about the everyday aspects of where they live. It would seem that the economic value is limited with the few financially successful operations relying on free or cheap labor and surviving on modest incomes. Some subsidy may be on the way, be it via governments concerned about the democratic participation of citizens, or

global internet companies looking to deflect from their role in spreading fake news and offering redress for their soaking up of local advertising revenues.

That hyperlocal journalism has attracted so much interest from scholars is due to the ways in which it offers a space for innovation and passion in equal measure, where citizens give voice to their concerns and find like-minded others who can help sustain their operations and find audiences for their content.

IMAGES, OWNERSHIP OF

Copyright law is central to the ownership of photographs, yet photography has consistently been a cause of dispute in the context of how copyright law should be applied to this subject matter. Starting from the early days when photography was struggling to be regarded as an artform rather than merely a mechanical process, questions continue to be asked about whether and how copyright should protect photographic expressions particularly those of a more functional nature. The law on the ownership of images has become more settled in recent years yet it is not without its controversies with the increasing awareness and use of the fair use provisions under U.S. law, the complexes of issues of authorship and ownership under the works for hire doctrine and also due to the realities inherent in the move from an analog to the digital environment. The latter development has hugely improved the ease of dissemination of images but has also consequently allowed for more prevalent use of unauthorized images.

Photography and Copyright Law

Photography has been a troublesome subject matter when it comes to copyright law. From the outset, there has been a tension as to whether the act of taking a photograph is either a creative act of authorship or, as photography was widely viewed at its outset, simply an engagement with a process of mechanical reproduction. In *Burrow-Giles*

Lithographic Co. v. Sarony (1884), the Supreme Court clarified the status of photographs under copyright law. This case concerned a photograph of the Irish playwright and poet Oscar Wilde. It centered on the question of whether a photograph, in this case one taken by the renowned portrait photographer Napoleon Sarony, was a work of authorship protectable by copyright. Sarony had sued the Burrow-Giles Lithography Co. over their unauthorized sale of large numbers of the photograph in question. The defendants argued that photographs did not involve authorship and were therefore simply the result of a mechanical process and lacked originality.

Copyrightable works must demonstrate *authorship* in order to be protected. This is according to the U.S. Constitution which provides the basis for copyright protection with Article 1, Section 8, stating that Congress has the power “[t]o promote the progress of science and useful Arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.” Thus, works must be *writings* of an *author* in order to be protected. A core requirement for copyright protection is that works must be *original*. The originality requirement was also grounded in constitutional provisions by the Supreme Court in both the *Burrow-Gilles* and *In Re Trade-Mark Cases* (1879) decisions.

In deciding that photographs should be protectable subject matter under copyright law, the Supreme Court in *Burrow-Giles*, Christine Haight Farley in her 2004 article, “The Lingering Effects of Copyright’s Response to the Invention of

Photography,” has noted, “the Court focuses only on the pre-shutter actions and processes. In this way, the work of the author would appear to be entirely separate and distinct from the work of the machine.” The Court stating that Sarony,

gave visible form by posing the said Oscar Wilde in front of the camera, selecting and arranging the costume, draperies, and other various accessories in said photograph, arranging the subject so as to present graceful outlines, arranging and disposing the light and shade, suggesting and evoking the desired expression, and from such disposition, arrangement, or representation, made entirely by the plaintiff, he produced the picture in suit. (111 US 53, 55, 1884)

The Court held the photograph therefore to be original as it was the product of the *intellectual invention* of the photographer and thus copyrightable under the aforementioned constitutional provisions. After the judgment in *Burrow-Giles*, the Copyright Act was amended in 1865 to expressly extend protection to cover photographs and photographic negatives. Section 102(a)(5) of the Copyright Act of 1976 now specifies protection for “pictorial, graphic, and sculptural works” and under the definitions contained in Section 101 of the act it is expressly stated that this category includes photographs.

There has historically been some tension between competing notions of originality in the U.S. Courts. Some Courts favoring an approach that simply demanded that a work be independently created while others requiring a work to have some element of creativity in order to gain copyright protection. The Supreme Court in *Bleistein v. Donaldson Lithographing Co.* (1903) dismissed considerations of aesthetic merit in originality analysis and held that to gain copyright protection works must not be copied but also that an extremely minimal, almost negligible, amount of creativity was required to satisfy the originality standard. Justice Holmes stated,

The copy is the personal reaction of an individual upon nature. Personality always contains something unique. It expresses its singularity even in handwriting, and a very modest grade of art has in it something irreducible, which is one man’s

alone. That something he may copyright unless there is a restriction in the words of the act.

Originality was purposely left undefined in the 1976 act but the Supreme Court in *Feist Publications, Inc. v. Rural Telephone Service Co. Inc.* (1991) endorsed a creativity standard and reaffirmed the constitutional status of the originality requirement *stating*, “the constitutional requirement necessitates independent creation plus a modicum of creativity.” The Court continued to state that “[t]he sine qua non of copyright is originality.” The *Feist* Court also acknowledged that the threshold was a low one stating, “[t]o be sure, the requisite level of creativity is extremely low; even a slight amount will suffice. The vast majority of works make the grade quite easily, as they possess some creative spark, ‘no matter how crude, humble or obvious’ it might be.”

The Copyright Act of 1976: Ownership and Reuse of Images

The 1976 act states that “copyright in a work protected under this title vests initially in the author or authors of the work.” Section 106 of the 1976 act grants authors including photographers the exclusive rights to reproduce, create derivative works of, distribute, and publicly display their works. In a recent high-profile case, *Naruto v. Slater* (2018), taken by the animal rights group People for the Ethical Treatment of Animals, they sought to argue that Naruto, a macaque who had taken a selfie photograph when it pressed the shutter button on a camera, had copyright of the resulting photograph. The Ninth Circuit Court of Appeal held that the monkey did not have standing, the case reaffirms the principle that an element of human authorship is necessary for copyright protraction to arise. It should be noted also that while copyright registration is not a prerequisite for protection, which begins when a work is fixed in a tangible medium of expression, it is necessary if one wishes to bring an infringement suit in relation to U.S. works. Since February 2018, the U.S. Copyright Office has also changed its rules on group registration, the new rule allows for the registration, through the Office’s electronic registration system, of groups of both published and unpublished

photographs, up to a total of 750 in each claim. This change may well be of help to photographers in the fast-paced digital news environment of today.

Work for Hire

In the United States, under Section 201(b) of the 1976 act, the general rule that initial ownership of copyright in works created as part of an individual's job responsibilities is well established, the employer being treated as the author of the work unless it is expressly agreed to be otherwise in writing. This gives an employer the right to the entire work with the employee retaining no ownership rights whatsoever. The definition of works for hire in Section 101 of the 1976 act is inclusive of commissioned works, and these may be considered works for hire if two conditions are met. Firstly, the work must be in one of nine specified categories of works including, for example, supplementary work, collective works, translations, motion pictures, or other audiovisual works. Secondly, the parties involved must "expressly agree in a written instrument signed by them that the work shall be considered a work made for hire." While the aforementioned nine categories appear, *prima facie*, to be narrow in their apparent exclusion of many artistic works, it has also been argued that a broad interpretation of categories such as *supplementary work* and *collective works* could encompass a large number of works completed by freelance artists.

While the foregoing illustrates that there are two distinct categories for works for hire, some courts have failed to follow the intent of Congress and blurred the distinction between these. This blurring centered on the issue of where the line should be drawn between who is an employee and who is an independent contractor. The Supreme Court was eventually called on to rule on the issue in *Community for Creative Non-Violence v. Reid* (1989). This case concerned a claim by the charitable organization Community of Creative Non-Violence (CCNV) to the copyright in a statue named *Third World America*, which was constructed by the sculptor (Reid). CCNV had commissioned Reid to create the sculpture, which depicted homelessness in the United States. CCNV supplied some plans and sketches to Reid. CCNV,

however, argued that this was a work for hire situation and that they were an employer and therefore owner of the copyright in the statue. Central to this case was whether Reid could be considered an employee, and, on that point, the Supreme Court ultimately stated,

In determining whether a hired party is an employee under the general common law of agency, we consider the hiring party's right to control the manner and means by which the product is accomplished. Among the other factors relevant to this inquiry are the skill required; the source of the instrumentalities and tools; the location of the work; the duration of the relationship between the parties; whether the hiring party has the right to assign additional projects to the hired party; the extent of the hired party's discretion over when and how long to work; the method of payment; the hired party's role in hiring and paying assistants; whether the work is part of the regular business of the hiring party; whether the hiring party is in business; the provision of employee benefits; and the tax treatment of the hired party.

The Supreme Court held that notwithstanding the fact that CCNV had exercised some control over the execution of the work Reid was an independent contractor as, among other things, he had hired his own assistants, he had supplied his own tools, was paid a flat fee and did not receive employee benefits. It is clear therefore from this judgment that a clear contractual basis for works carried out on a freelance basis, including the work of photographers, is necessary in order to avoid ambiguities that may lead to disputed status and thus ownership of copyright.

On this issue, two further cases also need to be noted. Firstly, *New York Times Co. v. Tasini* (2001) where a group of freelance authors took an action against *The New York Times* and a number of other publications on the basis that they had placed articles by the authors on three online databases. The Supreme Court held that such uses were a separate exploitation of the works in question and not merely a *revision* of their collective work, which would not have necessitated separate permissions. The ruling meant that freelance authors would be able to

engage in negotiations in relation to the electronic uses of their works. Despite this seeming victory for freelancers however, publishers often have large bargaining power when negotiations are conducted and even before *Tasini* authors were often presented with broad contractual provisions including electronic uses of their work that they had little choice but to accept in many circumstances. This may still be the practical reality post the *Tasini* decision.

The Supreme Court in *Tasini* held that for a use of a work to be considered a revision, it would have to appear in its *original context*. Subsequently in the case of *Faulkner v. Nat'l Geographic Enterprises Inc.* (2005), Court of Appeals for the Second Circuit held that the publication of a digital archive that contained photographs and previous articles by *National Geographic* on digital formats such as DVDs and CD-Roms was a privileged revision of those works and therefore the authors' consent was not required, as the publication had merely created an *electronic replica* of the works.

Fair Use

The 1976 act also enshrines the doctrine of fair use, which provides defenses for the use of copyright works, including photographs, without permission in certain circumstances. Section 107 of the 1976 act states that fair use is not infringement, it then lists six illustrative purposes that may qualify as fair uses (criticism, comment, news reporting, teaching, scholarship, and research) and four factors to be weighed when considering if the use is fair or not:

- (1) the purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes;
- (2) the nature of the copyrighted work;
- (3) the amount and substantiality of the portion used in relation to the copyrighted work as a whole; and
- (4) the effect of the use upon the potential market for or value of the copyrighted work.

Fair use also provides a defense against infringement of the limited moral rights provisions under Section 106A of the Copyright Act of 1976, which

seek to protect the attribution and integrity rights of some artists dealing in limited editions of their work. This would include still photographic images used for exhibition purposes, but the protections only relate to works that are produced in editions of up to 200. These rights were introduced by the Visual Rights Artists Act in 1990.

A number of high-profile court decisions have explored how far the fair use doctrine may allow the reuse of photographic works. Two of these cases concern the work of the well-known appropriation artist Richard Prince. Prince has a noted history of practicing on the boundaries of what is infringing under copyright law. His most famous work is arguably *Untitled (Cowboy)* (1989), which involved rephotographing and then modifying Marlboro cigarette adverts that featured their famous cowboy figure. His work often involves photographing or scanning of the works of others and the near verbatim recontextualization of those photographs. Prince has been the subject of a number of legal suits that have highlighted his complex relationship notions of authorship. *Prince v. Cariou* (2013) in the Court of Appeals for the Second Circuit is perhaps the most high-profile of these cases. Prince was accused of appropriating photographs taken by the photographer Patrick Cariou of a Rastafarian community in Jamaica. Prince only made what could objectively be seen as very minor visual changes to the original photographs and then he claimed them as his own work. The Court held that Prince's use of 20 of the 25 works was fair use (five others being remanded for further consideration) on the basis that they were sufficiently transformative in terms of the original photos. Ultimately, the case was settled in 2014 after the Supreme Court denied a petition for a writ of certiorari, but the case is still seen as an extreme application of the fair use doctrine, which favors those who reuse copyright works to the detriment of rightsholders, in this instance photographs.

A second case concerned the 2014 *New Portraits* series exhibition by Prince in which he made copies of photographs that had been posted on social media and minimally transformed them by placing brief whimsical comments under the images. Prima facie, the *New Portraits* works employed much less obvious visual authorship by Prince when viewed in conjunction with his

previous use of Cariou's photographs. In the District Court for the Southern District of New York case, *Graham v. Prince* (2017), that court ruled against Prince in relation to his use in *New Portraits* exhibition of a photograph of a Rastafarian taken by the photographer Donald Graham. The image of the Instagram post was consequently displayed, among other places in a gallery and on a billboard. The court denied a motion from Prince to dismiss and went on to strongly indicate that the use of Graham's work would not be considered fair use in any subsequent hearing. It remains to be seen in the future whether courts will continue to employ the more expansive approach to fair use as seen in the *Prince v. Cariou* litigation.

Digital Developments and Ownership of the Image

Two other more contemporary developments related to the ownership of photographs are the increasing prevalence of licensing to image databases and the role of social media in the creation and dissemination of journalistic images. The move from analogue to digital in recent decades has both increased the ease of distribution of images but also made unauthorized use of copyright works more difficult to control. Photographers have also increasingly used watermarks and metadata as a method of identifying and protecting their works.

Firstly, the digital age has heralded the increasing influence of large online stock imaging library services. These enterprises deal with images concerning a very broad range of subject matter compared with the previous more proliferated landscape containing a number of smaller more bespoke firms dealing with specific subject matter areas. Getty Images (at first called *Getty Investments*) was founded in 1995 and by 2007 was the leading player in the industry. The use of such services has led to ever more streamlined licensing processes with ease of use for both the owner of the copyright and those wishing to use it. The rights management model of licensing, essentially the licensing of the image on the basis of each usage, is what was previously widely used. Other models have since developed, such as the royalty-free model, which allows for

nonexclusive repeated specified uses. The terms and value of the license may depend on the material in question and what one intends to do with it. Subscription-based licensing services for images are also available. Getty also offers an embedding option for noncommercial users, which allows free and legal access to 66 million images.

Secondly, distinguishing between the professional and the amateur photographer has become more difficult in the current digital environment. With the increasing pace of the news cycle, the role of images captured by the amateur, accidental, and citizen journalists is becoming of increasing importance. This development has also placed pressure on the practice of publications having in-house photographers. A 2017 study for the Tow Centre for Digital Journalism at Columbia University titled "Amateur Footage: A Global Study of User Generated Content" highlighted a number of issues with the use of material from members of the public. It highlights that a number of licensing companies are now dealing with the licensing of such images as well as that the approach to gaining permission from those who take these images may vary greatly. Ranging from written agreements drawn up by lawyers to the more legally dubious method of simply retaining a screen grab of an affirmative reply on social media to a request to use images.

Final Thoughts

The established copyrightability of photographs has now, in statutory terms at least, clarified many issues surrounding the ownership of images. Notwithstanding this, some uncertainties remain, for example, in the form of the fair use doctrine, often expansively applied. In light of the contrasting approaches of courts highlighted in this entry, it remains to be seen how court decisions in the future will apply the doctrine. This is particularly so given the new uses of works that many digital practices now allow.

The work for hire doctrine has been the subject of some clarification by the courts, but this may ultimately have limited implication for those seeking to retain copyright ownership to images. This is due to the realities of bargaining power and leverage in the publishing environment, and apparent

gains in the courts may have limited implications when it comes to the actual marketplace realities.

Lastly, the ever-developing digital environment has concurrently facilitated an ease of both dissemination of images and their infringement as well as altering licensing practices and changing the structure of many business models to which the dissemination of images is integral. It has also created uncertainties around ownership and permissions for the use of images that need to be resolved.

IMMIGRATION, COVERAGE OF

The presumed influence of mass media on public attitudes about immigration combined with the rising salience of immigration as a political issue makes it important to understand patterns in immigration coverage. As many citizens do not come into direct contact with immigrants or immigration in their daily lives, they are reliant on information sources such as the mass media.

The literature on immigration coverage by the mass media is rich and diverse. This entry offers an overview of the dominant approaches and most common findings in research on news media depictions of immigration. Most studies have examined a set of distinct attributes of news coverage of immigration, among which its salience, tone, and framing are most relevant. These theoretical perspectives are briefly discussed. Next, the entry looks at agenda setting and framing as key political communication theories that explain why immigration news matters and how it may affect public opinion and citizens. The entry concludes by identifying a set of challenges and possibilities for journalists with regard to immigration coverage.

Rise of Immigration as a Political Issue

In recent years, immigration has climbed high on the political agenda across Europe and the United States. According to Gallup data from 2019, 23% of Americans said immigration was the most important problem that their country was facing, which was a new high and indicated that Americans' worries about immigration had amplified. Eurobarometer figures reveal similar trends for Europe, especially for 2015 and 2016 in the wake of the refugee crisis. Parallel to its rising salience, immigration has become an increasingly polarizing issue in Europe and the United States. While many citizens acknowledge the benefits that immigration can bring along for the host society in terms of—among others—economic revenues and cultural diversity, public opinion remains negatively biased with regard to (mostly illegal) immigration. Media scholars have started to examine patterns in coverage of immigrants and immigration in the mass media and news in particular as a

contextual-level factor that may shape citizens' opinion on immigration. While the literature on immigration coverage is comprehensive and diverse, a set of commonalities can be observed. Most studies either focus on the salience of immigration as a topic in the news or on the attributes of immigration coverage (e.g., tone and framing).

Attributes of Immigration Coverage

In 2015, global news headlines were dominated by the shocking picture of Alan Kurdi—a 3-year-old boy of Kurdish descent who drowned on September 2, 2015, while trying to cross the Mediterranean Sea to reach Europe. This image has traveled all over the world, sparking fierce responses from political leaders across the world on how to handle immigration. For many, the picture of Alan Kurdi developed into a symbol marking the 2015 refugee crisis that burst out in Europe, illustrating the power that mass media—news in particular—can have setting the political agenda and shaping public opinion. In particular, the salience, framing, and tone of news on immigration matters.

Salience

Many studies consider the salience of immigration in news coverage, adopting an agenda-setting perspective while analyzing immigration coverage and its ramifications for public opinion. By covering immigration, journalists signal that immigration is a relevant political issue that warrants attention. These studies analyze the share of immigration coverage in comparison to other news topics. The salience of an issue is exactly what is needed to motivate political action: If the death of Alan Kurdi had not been that visible in the news, it would probably not have provoked political reactions.

Generally, one can draw three main conclusions on the salience of immigration. First, immigration is a salient topic compared to other topics, and this has increased over time, but it largely fluctuates and often relies on momentum. Second, the salience of news on immigration is partly inspired by real-life developments. For instance, immigration coverage seems to rise after a terror attack. Still, the amount of immigration news does not always fully align

with reality. A comparative study examining immigration coverage in the Netherlands and Belgium found that even when actual refugee flows were decreasing, this trend was not mirrored by news coverage. Third, individual actors (e.g., immigrants, refugees and ethnic, racial, or religious minorities) remain underrepresented in news media compared to their share in the population. Still, this trend is gradually shifting, which may be linked to trends in society of rising emancipation of immigrants and media regulation.

Tone

Tone is a vital attribute of immigration coverage as it adds an evaluative component to messages disseminated by journalists. Studies typically distinguish between positive, negative, mixed (i.e., a combination of positive and negative) and neutral tone. As is asserted by John Zaller especially unidirectional and uniformly negative messages are likely to affect citizens' opinion. If news on immigration is skewed to the negative, this can (re)activate hostile attitudes toward immigrants because the messages people select from form an overwhelmingly negative information environment. Prospect theory by Daniel Kahneman and Amos Tversky also outlines that citizens are risk-averse and have a primordial need to protect themselves, clarifying why people are more responsive to negativity and why journalists often rely on negativity and on conflict. In line with this trend, immigration coverage is overwhelmingly negative, although differences depending upon the type of immigrant group, outlet, genre, and country have been noted.

It has been argued that negativity is a key characteristic of news as it is journalists' duty to report on what is going wrong in society, to signal problems and to hold political leaders accountable. Even when considering this tendency toward negativity as a given, coverage of certain immigrant groups tends to be more negative than coverage of natives, implying that there is something distinctively negative about news of immigrants. For instance, the issue of immigration and integration has been ranked the third most negatively covered issue in political news reporting in democracies. Moreover, in one study focusing on the United Kingdom, 31% of the headlines about Muslims had a negative tone compared to headlines on Jews (2%) and Christians (13%).

Framing

Framing, or how issues are packaged in the news, is a heavily debated concept that has been often applied to immigration coverage. Typically, a distinction has been made between generic- and issue-specific frames. While generic frames can apply to any news topic, issue-specific frames have been specifically developed to study immigration news.

In terms of generic framing, episodic and thematic framing are most relevant. While episodic framing illustrates an issue via considering an individual case, thematic frames cover issues in-depth by adopting a general outlook and offering background information. For instance, a news story on the drowned boy Alan Kurdi focusing on his life trajectory and journey is an episodic frame. News stories that show figures and report statistics, giving a bigger picture and focusing on broader patterns of immigration (and reasons for it) are so-called *thematic frames*. The first (episodic) is more prevalent: Most immigration news stories are framed episodically, focusing on rare events or specific situations and reporting on individual cases to illustrate a broader trend. Often, background information on the reasons for immigration is lacking, and societal implications or causes are neglected.

Other generic frames in immigration news that are routinely reported are human interest frames (i.e., focus on emotional and personal cases) and the victimization *versus* the perpetrator frame. News stories such as those about Alan Kurdi, or those published in 2018 detailing how hundreds of Latinx children were forcibly separated from their parents after families crossed the border into the United States without authorization, have a “victim” angle to them. News coverage of the disturbances during New Year’s Eve 2015 in Cologne are a prototype example of the perpetrator frame, as are narratives about the return of “Syria fighters” or supporters of the Islamic State of Iraq and Syria to their host countries in Europe to commit attacks. Indeed, immigrants are significantly more often depicted as victims and perpetrators than natives. While the perpetrator frame seems to be a steady ingredient of coverage, a victim frame seems particularly present at the beginning of a

news cycle, fading away once the novelty of the issue has worn off. This also applies to news coverage of the 2015 refugee crisis.

Apart from generic frames, many studies have examined issue-specific framing of immigration. The most common are “threat frames” that either adopt a cultural, economic, or safety angle while covering immigration and essentially portray immigration as a threat to the host society and its inhabitants. In a cultural threat frame, immigration is being depicted as leading to a “clash of cultures,” focusing on the need for assimilation or on distinct values that are supposedly held by immigrants. For instance, immigrants with a Muslim background have been depicted as not respecting human rights, such as gay rights and equality between men and women.

Economic threat frames document the costs of immigration by emphasizing public spending, freeloaders, rising poverty, or competition on the labor market (“They steal our jobs”). Criminal frames, finally, portray immigration as a security threat, linking it to crime, violence, and terrorism, of which news on alleged violence in the marches to the United States of Latinx immigrants are illustrative. These frames have been found both in U.S. and European coverage of immigration, and there is an ongoing debate on which threat frame (i.e., cultural, economic, or criminal) is most prevalent. Of course, the opposite of threat frames has been documented too: frames underlining the benefits of immigration in terms of diversity and economic revenues, but these are significantly less common.

Differences Across Outlet, Genre, Group, and Context

While generally a negativity bias can be noted in coverage of immigration and a tendency toward the use of threat frames is evident, many of these findings are context-specific. Differences across outlets, genres, groups, and context (time and country) can be noted. The type of outlet plays a role: Newspapers discuss issues such as immigration more in depth compared to television and online news. Newspapers pay more attention to background information and make more use of thematic framing, while television and online

reports of immigration mainly use episodic frames, focusing on individuals and emotions. Likewise, print media report slightly more favorably on immigration than online and television news.

Genre-specific differences also exist. For instance, broadsheet newspapers and hard news programs pay more attention to contextualizing immigration and thematic framing compared to tabloids and soft news programs, which mainly focus on emotions and sensational aspects. Similarly, ownership matters as publicly financed outlets (e.g., public broadcasters in Western Europe) are more balanced in their reporting than their commercial counterparts. Also, the ideology of news outlets is relevant as liberal newspapers and broadcasters report more positively about immigration than their conservative competitors.

The salience, tone, and framing of coverage depend upon the immigrant group: Groups that are more culturally distinct are subject to more negative and threatening coverage than others. Finally, context in terms of geography and time is key: Dominant trends in immigration coverage differ between countries (dependent upon their history and experience with immigration and in terms of the type of immigrant groups that are being targeted). In the United States, Latinx immigrants are a major immigrant group, while in Western Europe the focus is mostly on people from the Middle East, sub-Saharan Africa, and North Africa. Finally, immigration coverage is not static but evolves over time as social norms change. Recent studies sketch a different picture compared to earlier studies by showing that the tone and framing of immigration coverage can evolve and follow trends in society.

Immigration Coverage and Public Opinion

The rationale underlying studies of depictions of immigration is grounded in the assumption that media messages have great potential to shape public opinion. Media effects studies have adopted this as a premise to examine the cognitive, attitudinal, and behavioral effects of exposure to immigration coverage. While the earliest studies have verified correlations between exposure to immigration news and public opinion using survey

data, recent studies have empirically examined the causal mechanism using advanced methods (e.g., time-series analysis, panel data, experiments). The implications of immigration coverage for public opinion are discussed here primarily from the angle of the agenda-setting and framing theories, media effects theories found in political communication literature. Both are relevant mechanisms in journalism that need to be considered.

Agenda setting and framing start from the idea that the salience, tone, and framing of immigration coverage can sway public opinion on immigration. For instance, high salience of immigration in the news could put the issue high on the public and/or political agenda and nestle the idea in people's minds that immigration is a relevant issue that needs to be addressed by the country's leadership. Attention to this issue in journalism can help to draw attention from the public and from politicians.

Studies have observed close connections between the salience of immigration coverage and public worries about immigration. Framing effects studies, in turn, have found effects of exposure to threat frames on public opinion, emotions, and behavior. For instance, exposure to a certain threat frame on immigration can (re)activate the interpretation of immigration in line with the frame. Confrontation with a criminal threat frame (e.g., on riots or on terrorism) results in more agreement with statements that immigration threatens safety. Of course, the strength of the effect depends on a set of features, such as the repetition and duration of the frame, people's predispositions (e.g., political orientation, knowledge, intergroup contact), and on how typical a threat frame is for the immigrant group involved. The negativity bias is persistent as threat frames have strong effects and their effects are difficult to neutralize.

When discussing effects of immigration coverage, qualification is warranted. Just as with all media effects, citizens' prior predispositions play a role as well and not all citizens will be as easily influenced: high levels of education, more political knowledge, and ideology can play a key role in counterbalancing the effects. Moreover, nowadays the possibility of self-selection and selective exposure is relevant to consider. This possibility sheds

doubt on the causal mechanism: It could well be that people who are already negative toward immigration decide to watch news outlets that are widely known to be critical of immigration.

In the United States, people who watch Fox News usually already have hostile views on immigration, making it difficult to disentangle the causal mechanism and settle the “egg or the chicken” question. Similarly, individuals are less ready to accept news messages that explicitly contradict their predispositions. Probably, effects of exposure to immigration news are likely a reinforcing spiral with causality running in both directions. Finally, it is extremely challenging to isolate media effects and most studies cannot be conclusive about the duration of media effects. Indeed, many of the effects tend to be modest in size and coexist alongside other, alternative explanations.

Challenges and Opportunities for Journalists

Nowadays, society is rapidly changing due to new technological advancements, which has implications for the work of journalists. These developments can give rise to challenges but could also be an opportunity for journalists. Due to the rise of social media and the growth of user-generated content, journalists’ gatekeeping role is under pressure. Thus, journalists have a key role to play in fact-checking and have a duty to critically reflect on the credibility of the content and sources of news messages. Preserving this gatekeeping role is more relevant than ever, particularly when covering polarized issues such as immigration, because some actors may have incentives to deliberately spread negative or biased news stories. Similarly, in times of social media, journalists and news media organizations need to be vigilant for disinformation and actively mobilize to reduce the likelihood that fake news stories spread. The setup of fact-checking platforms (e.g., FactCheck.org) can be an efficient tool to fight misinformation and eliminate fake news.

The presence of a strong public broadcaster (as in most Western European countries) and of strong independent, nonpartisan news outlets can provide a counterbalance to ensure reliable, objective, and nuanced coverage on immigration. They tend to report on issues more in-depth and set the

standards for commercial players. At the same time, due to the high choice environment, people can pick which type of (news) media to consume, making this a challenge.

More diversity in the voices and sources in immigration news can help to stimulate different perspectives. It remains a challenge to actively incorporate views of immigrants and to grant a voice to vulnerable groups in society. The latter is crucial as news representation can have an emancipatory effect, and mass media depictions can also affect how immigrants perceive their own role and position in society.

Finally, in a market with elevated competition, autonomy in selecting news sources and the rise of “niche” media, one needs to be wary of selective exposure and self-selection into particular news on immigration. People tend to consume news that already coincides with their opinions. Combined with the possibility of compiling one’s own media diet, this makes it difficult to expose viewers to distinct and diverse viewpoints on immigration. Being aware of these risks and possibilities helps to create awareness of the role and responsibility of journalists in immigration coverage.

INDECENCY AND OBSCENITY

Indecency and obscenity deal with words or images concerning sexuality that are considered so offensive, inappropriate, or harmful, that they should be legally banned or restricted. *Obscenity* is the legal term for content that is judged so offensive because of sexual or excretory content that it must be banned and criminalized. The exclusion of obscenity from protections under the First Amendment to the U.S. Constitution is one

of the *de facto* cornerstones of American freedom of expression policy. Many of the major censorship battles of the 19th and 20th centuries were fought under the banner of obscenity. *Indecency* is a newer legal concept, covering material not meeting the obscenity threshold, yet viewed as inappropriate or harmful for minors. *Pornography* is a broader term, referring to writing and images designed primarily to arouse sexual desire; pornography may or may not be determined to fall within the narrower categories of obscenity or indecency.

Obscenity and indecency laws often highlight cultural conflicts. For example, indecency battles in the late 20th and early 21st centuries, involving attempts to restrict what children might see or hear, reflected and arose from fundamentalists' frustration with increasing explicitness of television and the Internet. Those indecency conflicts in turn echoed the obscenity battles that began in the late 19th century, as Anthony Comstock and others sought to impose Victorian morality on increasingly bold and unconventional writers and artists. Changing social mores and the freedom of expression principles of the First Amendment have often, but not always, prevailed over restrictive laws.

Censorship and Obscenity in Western Traditions

Throughout Western civilization, people have been concerned about whether certain literary or artistic content was so inappropriate or harmful that it should be censored. In the Republic, Plato suggested that it was the duty of parents to “expose their children to good material and shield them from bad material” and the duty of the state to do the same for its citizens. American civil liberties lawyer Morris Ernst, who fought many censorship battles in the early 20th century, took the position that censorship is inappropriate because morality is internal, citing Paul's Epistle to Titus in Christian Scriptures: “To the pure, all things are pure; but to the defiled and unbelieving, nothing is pure. Indeed both their minds and their consciousness are defiled” (Titus 1:15).

Sexual content in art and literature was common in antiquity, and strict laws on obscenity are products of the age of printing. In his *Areopagitica*, John Milton explained that he found no

evidence of the suppression of any book in antiquity solely based on obscenity. Prior to the printing revolution of the 1500s, state censorship, if any, generally focused on other areas. As Judge Curtis Bok described it in his 1949 decision in *Commonwealth v. Gordon*,

Censorship, which is the policeman of decency, whether religious, patriotic, or moral, has had distinct fashions, depending on which great questions were agitating society at the time. During the Middle Ages, when the church was supreme, the focus of suppression was upon heresy and blasphemy. When the State became uppermost, the focus of suppression was upon treason and sedition. The advent of technology made Queen Victoria realize, perhaps subconsciously, that loose morals would threaten the peace of mind necessary to the development of invention and big business; the focus moved to sexual morality.

Modern obscenity laws can be traced to the Puritan demand for strict sexual standards. Initial efforts by Puritans in England to restrain *licentious* and *hurtful* publications failed in 1580. A century later, the case of Charles Sedley of Kent initiated the legal thinking that led to obscenity laws. Sedley, after a long bout of drinking, appeared naked on a tavern balcony in London and pantomimed a series of indecent proposals to the passing public. He was prosecuted in 1663 for breach of the peace, and this theory was later used against printers of allegedly indecent materials. The law's development was slow, with the obscenity theory rejected in 1708. In 1727, however, anti-Catholic parodist Edmund Curll was convicted for what might be considered a modern obscenity offense, based on his book explicitly describing licentious behavior in a convent.

Even after Curll's case, however, obscenity prosecutions were rare and sexually explicit writings were commonplace. For example, John Cleland's book, *Fanny Hill: Memoirs of a Woman of Pleasure*, which many years later became the subject of obscenity prosecutions in the United States, was published and distributed in England in 1749 with only a mild judicial slap on the wrist for the author, and no restraints on its wide and profitable distribution.

Early American Practices

In colonial America, censorship initially focused on theater. It is not clear whether sale of obscene literature was even a crime in America prior to the Revolution. Colonial intellectuals freely read books like Henry Fielding's *Tom Jones*, Laurence Sterne's *Tristram Shandy*, Ovid's *Art of Love*, and the works of François Rabelais. Washington Irving called one of the popular books of the early federal era, Susanna Rowson's *Charlotte Temple*, a case of *licentious ribaldry*—an indication that licentiousness in books was tolerated.

By the early 1800s, however, several states adopted obscenity statutes, other states recognized obscenity as unlawful under common (judge-made) law, and these laws were applied to books and other written content. A few states, like Massachusetts, set up censorship boards and retained draconian censorship standards well into the 20th century (until 1930, the Massachusetts obscenity statute forbade the sale of any book “*containing* obscene, indecent language”).

By the mid-1800s, obscenity prosecutions focused on pornography and overt discussion of sexual matters. Prosecutions were generally aimed at works viewed as exploitive but not recognized writers. Massachusetts banned *Fanny Hill* in 1821. Artists and recognized writers were often effectively given more leeway. Some of Walt Whitman's passages in *Leaves of Grass* shocked American Puritans and English Victorians, and some of those passages were challenged by authorities. However, the controversy only helped Whitman in the public eye and his book was eventually published.

Comstockery in America

In British law, obscenity first developed under common law, but in 1857, Parliament enacted the Obscene Publications Act, also known as Lord Campbell's Act, which provided for seizure and summary disposition of obscene and pornographic materials. The 1868 case of *Regina v. Hicklin*, concerning an anti-Catholic pamphlet, brought that act before the courts. In *Hicklin*, Chief Justice Cockburn of the Queen's Bench held the material within a publication was obscene under the law if it “had a tendency . . . to deprave and corrupt

those whose minds are open to such immoral influences, and into whose hands a publication of this sort may fall.”

The *Hicklin* test, which judged works by their possible effect on the most vulnerable, rather than a work’s probable audience, favored prosecutions. It focused on the challenged portions, not the entirety of the work. Thus, under *Hicklin*, if any portion of a work was judged to be obscene, the entire work could be outlawed. It created a subjective standard, leaving each judge or juror to their own judgments as to depravity, corruption, and immorality. Finally, it included no consideration of the author’s intentions.

After *Hicklin*, more and stricter obscenity laws were enacted throughout the United States, particularly after Anthony Comstock began his censorship efforts. In 1873, Comstock, a moral crusader with narrow Victorian and Puritanical views, founded the New York Society for the Suppression of Vice, which became his platform for encouraging and aiding obscenity prosecutions and other means of policing public morality. In doing so, he followed the model of the Society for the Suppression of Vice formed earlier in London, and he in turn inspired the Watch and Ward Society in Boston. Comstock and his cohorts lobbied for and drafted statutes (popularly known as *Comstock Acts*) that criminalized explicit sexual material. New York passed such a law in 1868, and the federal Comstock Act of 1873 made illegal the delivery by U.S. mail, or by other modes of transportation, of “obscene, lewd, or lascivious” material, as well as materials dealing with birth control and abortion. The law authorized severe penalties and empowered the Post Office to censor and confiscate objectionable materials. Comstock boasted that within a year, several hundred thousands of pounds of books were destroyed.

Comstock societies were not mere advocacy organizations. They acted as a kind of auxiliary police force, actively searching for materials they deemed objectionable and building cases on their own. Comstock became a special agent of the United States Post Office, and he and leaders of other societies for the Suppression of Vice served in a sense as *de facto* prosecuting attorneys. Their threats alone often suppressed publication or distribution of materials they deemed objectionable.

The activities of these societies became known as *Comstockery*, and they continued vigorously even after Comstock’s death in 1915.

As various Comstock laws were tested in the courts, they were upheld, with U.S. Courts generally following the *Hicklin* precedent from England. In 1896, the U.S. Supreme Court, in *Rosen v. United States*, approved the *Hicklin* test, finding it “quite as liberal as the defendant had any right to demand.” Comstock and his cohorts had the green light to actively enforce censorship well in to the early 20th century. As one judge noted, between 1870 and 1930, obscenity law was “on the social anvil.”

The first publication of a portion of James Joyce’s *Ulysses* in the United States illustrates the climate under Comstockery. A literary journal, *The Little Review*, published two excerpts from *Ulysses*. The New York Society for the Suppression of Vice obtained a copy of the journal, declared it obscene, and effectively forced a criminal prosecution of the two editors of the journal, Margaret Anderson and Jane Heap. Their lawyer, perhaps recognizing the perilous legal standard and social hostility to his clients’ publication, argued that the passages were not obscene because they were too difficult to understand. The editors were found guilty, and the two issues of the journal banned.

Emergence of Free Speech Concerns

When American obscenity law first developed in the 19th century, the First Amendment was relatively dormant and undeveloped. When First Amendment defenses were raised in obscenity cases, they were quickly dismissed, with obscenity deemed outside the scope of free speech protection. Even within a First Amendment model hostile to obscenity, however, libertarians began fighting in the early 20th century for more liberality in what was allowed, and meaningful procedural protections. Judge Learned Hand questioned the *Hicklin* test in 1913, noting it reduced the treatment of sex “to the standard of a child’s library.” Anti-censorship lawyers began litigating vigorous defenses, forcing courts to at least consider evidence of the need for discussion and resources on such important topics as sex education and contraception.

The second *Ulysses* case, litigated in 1933 before U.S. District Judge John Woolsey in New York City, represented a turning point. The literary-minded judge, armed with expert approvals of the work (craftily inserted into the case by Ernst, the publisher's lawyer), cleared the book of obscenity and in so doing propounded a standard quite different from *Hicklin*. Judge Woolsey considered the sincerity and artistry of the author, evaluated the book as a whole, and judged it not according to possible effects on the "least vulnerable" but upon "a person with average sex instincts—what the French would call *l'homme moyen sensuel*." He found nothing in *Ulysses* to constitute "dirt for dirt's sake" and therefore concluded that the book was not obscene. The court of appeals affirmed, similarly finding that the book did not "promote lust or portray filth for its own sake." The victorious publisher, Random House, then published *Ulysses* as part of its Modern Library series and included Judge Woolsey's decision in the front matter of the book for more than 50 years. Many U.S. courts followed Woolsey's standard.

By the mid-20th century, obscenity law was effectively out of control. Standards were unclear, prosecutions were inconsistent, and prejudice and political pressure continued to create chilling effects and influence decisions by judges and juries. Some works that have later become accepted as classics, like Theodore Dreiser's *An American Tragedy* (1925), were found obscene and banned, and other literary landmarks, like Allen Ginsberg's *Howl* (1955), were severely threatened by prosecutions. Comedian Lenny Bruce endured four prosecutions on obscenity charges, and he was ultimately convicted. Throughout the century, civil liberties lawyers, including Ernst, Charles Rembar, Martin Garbus, and Edward de Grazia, regularly defended challenged works, and while they won some and lost some, their challenges raised important literary, policy, and constitutional defenses. Their work chipped away at the absolutism of the Comstock era, and led courts to recognize both procedural and substantive defenses, and the need for a narrower understanding of obscenity with more room for literary freedom. Finally, U.S. Supreme Court Justice Potter Stewart's statement in *Jacobellis v. Ohio* in 1964—"I know it when I see it"—highlighted both the difficulty of

line-drawing and the marginal legitimacy of Victorian obscenity law in an increasingly creative and pluralistic society.

Supreme Court Sets Standards

The U.S. Supreme Court began addressing many obscenity cases in the mid-20th century. A key decision in 1952, *Joseph Burstyn Inc. v. Wilson*, recognized that motion pictures were a legitimate artistic medium, with the same First Amendment protection as traditional literature and art. The case involved a New York law that allowed a censor to forbid the commercial showing of a motion picture film that the censor deemed *sacrilegious*. Although the case did not involve obscenity, it led to the demise of state motion picture censorship regimes, which most often relied on obscenity determinations.

In *Roth v. United States*, in 1957, the Supreme Court for the first time tackled a definitional standard for obscenity. The case involved two book-sellers convicted of obscenity, under a standard similar to those in the *Ulysses* case, with the works judged as a whole, based on community standards applied to likely readers. Writing for a court divided in several ways, Justice William J. Brennan, Jr. reaffirmed that obscenity fell outside First Amendment protection, since by definition it is "utterly without redeeming social value." At the same time, he recognized that "sex and obscenity are not synonymous" and that "Sex, a great and mysterious motive force in human life, has indisputably been a subject of absorbing interest to mankind throughout the ages." As a result, the "standards for judging obscenity" must "safeguard" publication and receipt of allowable sexual content.

The *Roth* ruling laid bare the difficulties of judging obscenity and the divisions on the court. Justice Brennan defined obscenity as material that dealt with sex in a manner "appealing to prurient interest," meaning "a tendency to excite lustful thoughts" and create "lascivious longings." But lustful thoughts were closely connected to sex, that "great and mysterious motive force in human life." Chief Justice Earl Warren's concurrence warned that obscenity prosecutions could be used to suppress "great art or literature, scientific treatises, or works exciting social controversy," and

“the line dividing the salacious or pornographic from literature or science is not straight or unwavering.” Justices William O. Douglas and Hugo Black warned of making legality “turn on the purity of thought which a book or tract instills in the mind of the reader.”

Consistent with *Roth*’s focus on safeguarding free speech, later decisions created procedural protections against censorship. In *Smith v. California*, in 1959, the Court held that a bookseller who did not know, or has reason to know, of obscene materials on his shelf could not be found guilty of knowingly selling obscene materials. In *Freedman v. Maryland*, in 1965, the court prohibited censorship of films without due process.

The court continued to struggle with defining obscenity. In *Jacobellis v. Ohio*, in 1964, it overturned an obscenity conviction based in showing of an acclaimed French movie. In a trio of cases decided in 1966, including one which overturned a Massachusetts finding that *Fanny Hill* was obscene, the court settled on a three-part test: “the dominant theme of the material taken as a whole” must appeal to prurient interest in sex, it must be “patently offensive” under contemporary community standards, and it must be “utterly without redeeming social value.” The new standard failed to provide clarity. Eventually, beginning with its ruling in *Redrup v. New York*, in 1967, the Supreme Court began deciding cases solely based on the tally of a majority of justices, each applying his own standard.

Miller v. California

In 1973, the Supreme Court, with a far more conservative cast due to the appointments of President Richard M. Nixon, created a new obscenity standard in *Miller v. California*. Both *Miller* and its companion case, *Paris Adult Theatre v. Slaton*, dealt with explicit pornography, with sexual activity with genitals prominently displayed. The new standard focused on (a) the average person, applying contemporary community standards, (b) whether that person would find that the work depicts sexual conduct in a patently offensive way, and (c) whether the work, taken as a whole, lacked “serious literary, artistic, political, or scientific value.” The two big changes were *community* standards, and the requirement of *serious* social

value (a much higher standard than the utter absence of redeeming social value).

The *Paris Adult Theater* case, concerning a theater that admitted only adults and fully warned of the sexual content within, gave the court the opportunity to expand the privacy right recognized in *Stanley v. Georgia*, which in 1969 the court had held that “If the First Amendment means anything, it means that a State has no business telling a man, sitting alone in his home, what books he may read or what films he may watch.” But the court determined instead that the *Miller* standard would apply to all commercial exploitation of pornography.

The *Miller* test was no panacea, however. The very next year, in *Jenkins v. Georgia*, the Supreme Court reversed the determination of courts in Georgia that a mainstream movie, *Carnal Knowledge*, was obscene. The court cautioned that the showing of that film “is simply not the ‘public portrayal of hard core sexual conduct for its own sake, and for the ensuing commercial gain’ which we said was punishable.”

Commissions and Social Science

One might think that obscenity policy could be settled through scientific investigation of what, if any, sexual content, leads to harmful consequences in readers or viewers. But this judgment can only be made by people, and people (perhaps especially those appointed by politicians to fact-finding commissions) tend to bring their own preconceptions to any study. The Commission on Obscenity and Pornography, appointed by President Johnson in 1970, found no harm to society or individuals from the consensual distribution of sexual materials to adults. But a similar commission appointed by President Ronald Reagan, known as the Meese Commission, reached the contrary result in its 1986 report, concluding that the nation was “pervaded by sexual explicitness” that inflicted psychological harm on children and caused violence against women.

Special Concerns and Rules for Children

Supplementing basic obscenity law, U.S. courts have adopted special rules applying to children as recipients or subjects. In *Ginsberg v. New York*, in

1968, the Supreme Court recognized a category of “obscenity as to minors,” in which the standard obscenity test is adjusted to material suitable for minors, and lacking value for minors. Even more significantly, in 1982, in *New York v. Ferber*, the Supreme Court recognized a new exception to the First Amendment in the case of child pornography—pornographic works in which children were used as actors. The Court found special protections against child pornography necessary because the creation of such works abused children and needed to be disincentivized. In subsequent years, child pornography became the primary focus of pornography prosecutorial efforts, particularly after general obscenity prosecutions dropped off because of increasing public acceptance of pornography.

Indecency

Indecency was a latecomer on the legal scene, but by the late 20th century, it became the primary tool for those seeking to limit sexual and vulgar content from electronic communications, in the interest of protecting children. The federal Communications Act regulating broadcasting always contained a provision allowing regulation of *indecent* material. The Federal Communications Commission (FCC) enacted rules banning indecent material (material judged inappropriate for children) from the broadcast airwaves when children were likely to be watching. The Supreme Court in 1978 upheld those rules in *Federal Communications Commission v. Pacifica Foundation*, a case involving a radio broadcast of comedian George Carlin’s “seven dirty words” routine.

The Internet became an indecency battleground when it opened up to widespread commercial use in the 1990s. In 1996, Congress passed a Communications Decency Act, extending *Pacifica*-like restrictions to Internet content. The American Civil Liberties Union (ACLU) and American Library Association promptly challenged it in court, and the Supreme Court in 1997, in *Reno v. ACLU*, struck down the law as too vague, overly restrictive on a promising new medium, and incompatible with society’s “interest in encouraging freedom of expression.” (One unrelated law, codified within the Communications Decency Act, Section 230 covering intermediary liability,

remained on the books after *Reno*.) A later attempt at indecency regulation of the Internet, the Child Online Protection Act, similarly was held unconstitutional in 2004.

The indecency battleground shifted back to the television set in the early 21st century, as cable television (not covered by the indecency rules because cable signals do not enter homes involuntarily over the airwaves) carried more and more explicit content. Broadcast shows liberalized their own content in response. But fundamentalist groups, including particularly the American Family Association led by Rev. Donald Wildmon, directed thousands of complaints to the FCC. In 2001, that agency enacted rules that defined indecency to cover even fleeting nudity or fleeting expletives. A rift developed between these conservative FCC rules and the content being created by many TV producers (and the appetite of the television audience for more cutting-edge and explicit content).

A number of incidents testing the new limits arose in the early 2000s. One case involved a fleeting showing of the singer Janet Jackson’s breast during the halftime show of the 2004 Super Bowl. Another arose out of the musician Bono’s extemporaneous utterance, “This is . . . fucking brilliant,” upon the announcement in a televised 2003 ceremony that he had won a Golden Globes award. A scene on the TV show *NYPD Blue* showed the nude buttocks of an adult woman for about seven seconds and for a moment the side of her breast. Yet, another case involved a so-called teenage orgy scene in the show *Without a Trace*, which involved hardly any nudity, but a lot of suggestiveness. The FCC judged the scene indecent and fined the TV stations that broadcast it during the forbidden pre-10 p.m. time period. Because the program was broadcast at 10 p.m. in the Eastern and Pacific time zones, and 9 p.m. in the Central and Mountain time zones, fines fell only on stations in the less populated middle of the country—a result that highlighted the arbitrary applications of many FCC indecency judgments.

When several of the test cases on fleeting nudity and fleeting expletives were appealed, the restrictive FCC rules were ultimately overturned by the Supreme Court, in *FCC v. Fox*, in 2012, on the grounds that they were unconstitutionally vague. The Court, however, left little guidance for

creating sufficiently clear indecency rules that could be applied to an entertainment culture accustomed to explicit content. The issue reverted to the FCC, but that agency was reluctant to reopen this culturally divisive issue. Even by 2020, there were no new FCC indecency rules, and *Pacifica* remained the sole substantive precedent. Because neither cable TV nor the increasingly popular streaming services like Netflix were covered by the broadcast indecency rules, those rules became increasingly irrelevant to the 21st-century video consumer.

Interplay With Other Laws

Several feminist scholars have sought to cover discrimination or violence against women under the umbrella of obscenity law, but such a law was struck down in 1985 by a circuit court in *American Booksellers Association v. Hudnut*. In the early days of obscenity law, books judged obscene were left unprotected by other laws, including copyright, but under a 1979 precedent, even obscene movies may enjoy copyright protection.

Changes in Technology and Public Acceptance

While moralists (like Comstock) believe that precepts against obscenity and indecency follow from natural law, the empirical evidence suggests that legal developments follow changes in social outlooks. Liberalization of obscenity law in the late 20th century followed the sexual revolution, represented by the birth control pill, women's liberation, and overall increasing sexual freedom in society and sexual explicitness in popular art. By the 21st century, new technologies like videotapes, digital cameras, and the Internet (including its streaming video services) further dramatically changed acceptance of the taking, viewing, and sharing of explicit sexual content.

Modern Americans have been regularly exposed (from videos and the Internet) to material far more explicit than those involved in landmark cases like *Roth* and *Miller*. The commercial success of the pornography industry, and its infiltration into mainstream businesses like hotels, indicates that many Americans actively consume pornographic content. Law follows

social reality, albeit with some delay; and as a result of these realities, obscenity prosecutions have become more infrequent, and convictions, even in conservative communities, usually occur only for the most extreme content, such as content involving children or extreme deviant practices. By the early 21st century, technological and social changes had effectively made adult obscenity obsolete.

Final Thoughts

The changes in obscenity and indecency law in the United States over the centuries illuminate tensions within American society, the difficulties inherent in enacting morality into law, the consequences of censorship, and the influence of social, artistic, and technological currents. While First Amendment freedom of expression principles are key elements in determining obscenity and indecency policy, religious, avant-garde, and majoritarian thinking, and commercial activity, all significantly affect both laws and practices. While battlegrounds (e.g., theater to books to movies), and theories of censorship (obscenity *vs.* indecency), shift over time, the inherent cultural conflict between control and liberality may be inherent in human nature. Obscenity and indecency laws are likely to continue to evolve together with the influences that create and oppose them.

INDIA

India is one of the biggest media markets with 17,000 registered daily newspapers, 866 private and 49 state-run television channels, and 850 radio stations. It produces on an average more than 1,000 films a year in various Indian languages. India is the second biggest consumer of Internet and mobile technology in the world. The advent of satellite and digital technologies, and globalization after the 1980s, transformed the media industries in India from state-run, closely regulated entities into a highly competitive marketplace. The changing media landscape necessitated the expansion of regulatory regimes to deal with the emerging challenges of new technologies, market practices, and public interest concerns such as tariffs, access, and privacy.

While the initial stages of expansion brought in new players, the television and print media markets are witnessing increasing consolidation of ownership, leaving an oligopoly in control of major media, even as large numbers of smaller entities enter and exit the market. This entry discusses the origins and development of the news

media system in India, and the factors contributing to its growth. It then outlines the sectoral developments in print, radio, television, and online media in India. It concludes with discussions on representation of India's minority groups in the media and the state of media freedom.

Origins and Development

Newspapers and radio were introduced to India during the colonial era. The first newspaper, *Bengal Gazette*, was started in 1760 by a young Irish man named James Augustus Hicky whose journalism exemplified the eternal, unresolved issues of journalism's relationship with society and with power. Hicky served time in prison for exposing corruption in British East India Company, saw his press confiscated, and he died penniless. His short foray into public communication was soon followed by a variety of publications by Indians for social reform, women's emancipation, and for political mobilization both in North and South Indian provinces and in the many languages spoken across India. The 19th-century social reformer Raja Rammohan Roy is also recognized as an early pioneer of journalism. He started the Bengali newspaper *Bengal Kaumudi* and *Mirat-ul-Akhbar* in Persian in 1822.

By the early 20th century, Bal Gangadhar Tilak, Mahatma Gandhi, and B. R. Ambedkar began using the print media both for social reform and political mobilization for freedom from colonial rule. Although low literacy in early 20th-century India meant limited circulation, the print media played a significant role in setting the stage for the Indian independence movement.

Wireless radio broadcasting appeared in India, a British colony, in 1923 soon after its deployment in Britain. By the time of the Second World War, both print and radio were well-established, and the film industry began to take shape with indigenous production houses. The films and print publications run by Indians were found subversive enough to warrant censorship laws. In 1947, at the time of India's Independence, there were six radio stations and barely 330 newspapers. Television came only in 1959.

Less than 3 years after independence, in January 1950, India gave itself a constitution that declared it a sovereign, democratic republic. Later,

socialist secular was added to this. The first general elections were held with adult franchise in 1952, and since, India has remained a bastion of democracy in South Asia despite many challenges, bolstered by free media. The Indian courts have held that the freedom of the press derives from the right to freedom of speech and expression guaranteed under Article 19(1) of the Indian Constitution.

The formation of India and Pakistan in 1947 upon independence from Britain was followed by religious riots and the internal displacement of 12 million people across the new borders. There were 562 independent princely states and some border states such as Kashmir and Nagaland that had to be integrated into the new nation under various instruments of accession. India encompassed nearly 1,600 languages, 22 of which are recognized as official languages, and six major religions. Media were seen as having an important role in unifying the linguistic, ethnic, cultural, and religious diversity of identities under the new flag of India and the new Constitution.

Factors for Media Growth

Post-1947, changes in the socioeconomic profile of the population led to rapid media expansion. According to the first census in India after independence, about 18% of the population was literate. By the 2011 census, this had risen to 74%. Even though economic disparities persist, the growth of the economy and per capita income has helped in the robust growth of television and print media, especially in regional language markets.

Until the 1990s, when India began to open up its economy to global influences, the broadcast media were state-run monopolies, and print media circulation was restricted to the smaller percentage of educated elite. The winds of global change swept in, transforming the entire media landscape. The expansion of print media led to price wars between leading newspapers in major markets, resulting in a reduction in subscription revenues and greater dependence on advertising.

By 2020, 915 TV channels (866 private and 49 state-run TV channels) reached 836 million viewers from 197 million households; radio reached 226 million listeners. As of 2019, newspapers had

a readership of nearly 400 million and digital media had 449 million users.

Use of the Internet in India was constrained by limitations of technology but has expanded since the 2010s following the unveiling of new digital technologies and widening access to mobile phones. One survey found India ranked 122nd globally in Internet penetration in 2020, reaching 51.7% of the population, though it ranked second after China in terms of the number of users at 687.6 million.

Between 1995 and 2015, the Indian media and entertainment industry grew and diversified into a highly competitive and profitable market. The impact of the global economic crash of 2008 was short-lived on the Indian entertainment industry as the Indian economy withstood its fallout. However, in 2016, the Indian government withdrew from circulation high-value currency notes, which adversely impacted agriculture and small- and medium-sized enterprises that provide employment to nearly 90% of the population. The sudden loss of purchasing capacity had an immediate impact on the advertising industry.

A gradual recovery of the economy began in 2018. The introduction of addressability and digitization helped the television sector to improve its subscription revenues. However, the COVID-19-induced national shutdown in 2020 resulted in suspension of print editions of newspapers, shutting down of less profitable sister publications, and suspension of film and television shoots, which led to large-scale job losses across media.

Print Media

Early Years

The newspaper industry was in the private sector from the beginning in India. From the early years after independence, newspapers started by freedom fighters, social reformers, and political parties coexisted with the bigger newspapers run by prominent entrepreneurial families such as *Amrita Bazar Patrika*, *Gujarat Samachar*, *Mathrubhumi*, *Andhra Patrika*, *Times of India*, *The Statesman*, *The Hindu*, *The Hindustan Times*, and *Indian Express*.

The First Press Commission of India in 1954 mentioned 330 daily newspapers with an overall circulation of 2.5 million. In 2020, according to

the Registrar of Newspapers for India, of the 143,423 registered publications 19,782 are daily newspapers.

There are variations in literacy across regions, genders, and caste groups, but education in regional languages is a state policy. The unintended consequence of increasing literacy was the rise in media consumption in regional languages. The language media market has seen steady growth in the 2010s, bucking the trend of the global print media decline. Technological advances in printing and improvements in transport and transmission infrastructure were the other factors that accelerated and expanded the reach of print media to remote areas in India. Print media analysts predict potential growth for several more years as literacy rates continue to increase.

Status

The Hindi newspaper *Dainik Bhaskar* with 58 editions and a combined daily circulation of 5,119,720 is ranked third globally. *The Times of India*, which publishes in the English language with 34 editions, claims a daily circulation of 4,334,769, has been the largest circulated English daily for decades and has figured in the top 10 list globally.

The 2019 Indian Readership Survey report of the Media Research Users Council puts the newspaper readership at 425 million. Of this, Hindi dailies had 186 million readers, while the readership in other Indian languages was 211 million.

Inflection Points

There have been two inflection points in postindependent India that have changed the course of media industries. In 1975–1976, a national emergency was invoked by then-Prime Minister Indira Gandhi. Constitutional guarantees of free speech, assembly, right to life, and liberty were suspended, and the media was subjected to censorship. The ferment that followed after the Emergency was lifted and fresh elections were held in 1977, unleashed a wave of resistance and gave rise to civil society movements for women's rights, human rights, environmental campaigns, and a host of other forms of cultural dissent. Each of these movements saw its reflection and

articulation in media, in addition to a continued debate on the freedom of speech and expression.

The second inflection point was 1991, when India joined the globalization project and began to open its markets and borders to foreign entrepreneurs. Until 1991, the news and information domain and its control were closely identified with national sovereignty and national integration.

Foreign Direct Investment (FDI)

The media industry was not insulated from the push toward globalization of the rest of the economy. Although this tendency was more visible in the broadcast industry, the possibility of non-Indian citizens investing in or controlling print media became a matter of debate some 40 years after 1955, when the government decided to restrict ownership and control of media entities to Indian citizens. Initially the newspaper industry resisted FDI and managed to restrain liberalization tendencies of the government for its own industry even as a majority of the mainstream newspapers advocated opening up of the economy in all other sectors. FDI is capped at 26% in newspapers and periodicals dealing with news and current affairs, but 100% FDI is allowed in Indian entities publishing technical and scientific publications.

Ownership

The Second Press Commission (1982) was constituted after the Emergency in 1978, reviving the debate about diversity and plurality of ownership of media. The First Press Commission in 1954 had raised the issue of ownership of newspapers following the concentration of major newspapers in the hands of a handful of big business houses. The two major questions—Whether the newspapers in a newly independent India can be run by foreign individuals, and whether newspapers can serve the interests of a nascent democracy if they are owned and controlled by big business houses, continue to engage media observers in India.

Registrar of Newspapers for India data show that of the 30,117 publications reporting to it, 26,750 are owned by individuals and account for 68.06% of total circulation. Joint stock companies (2,084 newspapers) account for 26.26% of

circulation. Many of the major newspaper entities also publish general and special interest magazines and have forayed into radio and television industries. The Press Council of India (PCI), headed by a retired Supreme Court judge, is the only regulatory body for print media. The PCI is only an advisory body, exerting moral pressure on media houses without any authority to ensure compliance.

Radio

Early Years

Radio appeared in India as a club activity of the expatriate British community in India. Soon the economics of running the stations compelled the takeover in 1930 by the imperial British government in India. Expertise, both technical and managerial, from the BBC came to India to make the operations viable. All India Radio (AIR) was christened by Lionel Fielden in 1936 and soon a technical blueprint and a coherent plan for programming emerged.

AIR's aspiration was to shape itself into a public broadcaster, structured like the BBC, autonomous and accountable to Parliament. However, first under the British colonial rule and then after independence, the system remained firmly under the control of successive governments, making it a state-run broadcaster paying its political obeisance to the ruling dispensations and not a public broadcaster independent of political interference. Broadcasting remained a state monopoly by law in India until the 1990s, when private entities began to be permitted.

Programming and news were two major areas of AIR's relationship with its audience. Carrying on the preindependence tradition of audience segmentation, a host of program slots catering to workers, women, farmers, youth, and children became features that remain to this day. A wide sweep of cultural programs from classical to folk music and drama became staples and were popular. Much of the programming was guided by the national objectives of inclusivity, secularism, and diversity, which aided in the project of national integration. By 1952, community development programs began to be implemented and the

government explicitly recognized radio, for the first time, as an instrument and an ally.

Attempts at Autonomy

The Indian National Congress led the national government up to the mid-1970s. In 1975–1976 when the Emergency was imposed, the limitations of the news operations of AIR came under scrutiny and became an election issue. The demand to make broadcasting autonomous caught the public imagination. When the first non-Congress government was formed in 1977, a committee headed by the eminent journalist B. G. Verghese was formed to suggest ways to make broadcasting structurally autonomous from the political parties in power. Twenty years later, in 1997, AIR came under the Prasar Bharati Corporation when the Prasar Bharati Act was adopted by Parliament. Autonomy for news operations never came to fruition and cut-backs in funding and preference for technocrats instead of creative broadcasters in recruitment further weakened the public service mandate AIR set for itself.

Localizing, Entry of Private Channels

Efforts at localizing began in AIR in 1984 with the first medium wave local station at Nagercoil in Tamilnadu, which in 1997 switched its transmission to FM. The AIR network now has 86 local stations catering to underserved ethnic communities. The radio industry experienced a revival when the 386 private FM stations entered the market, mainly broadcasting popular music. Private radio stations are not allowed to generate and broadcast news. They have been recently allowed to carry news feeds from AIR. All radio stations are also required to follow the broadcast code of AIR as a license requirement.

Status of the Industry

As of 2020, AIR had one national channel, 129 regional channels, 86 local channels, and five community radio (CR) stations reaching out through short wave, medium wave, FM, satellite, and digital technologies. AIR originates programming in 23 languages and several dialects covering 99% of the population.

The rapid expansion of access to smartphones with FM radio and Internet access has opened newer vistas for the industry. The radio industry has been experimenting with new technologies such as podcasts and streaming to reach out to more segments of audiences. FM radio has been allowed 49% FDI.

CR

CR is set up and managed by local communities and institutions, unlike the local stations that the state-run Prasar Bharati commissions. The range of transmission also tends to be smaller than the local FM radio stations. CR policy was first announced in 2002 limiting the stations to educational institutions. In 2006, nongovernmental organizations were allowed to start CR stations after a decade-long legal and advocacy battle. There are now 289 operational stations. Being small stations that cater to a limited geographical area, setting up the stations, and meeting operational costs poses challenge to their viability.

Being the first broadcaster to appear in India, AIR set the framework for programming strategies, audience segmentation, and genres for nearly 60 years since its inception in 1923. In the early years of television in India, the vision for broadcasting prevalent in AIR was transferred to television, mostly because the formative years were guided by personnel from radio. Opening the broadcasting industry to commercial entrepreneurs, along with technological changes, has radically transformed radio and TV content since the 1990s.

Television

Early Years

Television came to India in 1959 when the Dutch company Philips donated its demo equipment that was brought to a trade fair in Delhi. Television was considered a luxury for a poor country like India that was involved in nation building after a long period of colonial rule. Until 1975 when the Satellite Instructional Television Experiment (SITE), a one-of-a-kind experiment in collaboration with NASA, was launched by the Indian Space Research Organisation to test its

potential as a medium for education and social development, television remained a low priority.

The television wing was christened Doordarshan in 1976 and launched as a separate entity after the conclusion of SITE. Although a slow expansion process began with stations and transmission towers, it was in 1982 that color television was introduced ahead of the Asian Games in Delhi. In 1984, the Indian government began installing a transmitter a day to scale up the reach.

In 1986, transmission networks began in each state of the country around local language programming hubs to move away from Delhi-centric coverage. The first national commercially sponsored soap operas, like *Hum Log*, were launched in the mid-1980s to a positive public response, followed in the late 1980s by serialized epics such as *Ramayan* and *Mahabharat*. For a decade, state-run television captured the imagination of the viewers with entertainment programming that celebrated some of the best literature and arts in the country.

Entry of Cable TV

By the mid-1980s an informal, unregulated cable industry began to emerge in metro cities. Cables were run from a central hub to apartments where popular movies on VHS were shown to residents. Indian viewers in some cities saw the first Gulf War live in 1991, ramping up the clamor for access to global media. India began its economic reforms in 1991 and was compelled to relax norms to allow foreign transmissions that were hitherto illegal.

Global Winds and New Regulation

In 1991, the entry of foreign channels began when Hutchison Whampoa Group of Hong Kong began transmissions across Asia on ASIASEAT with Prime Sports, MTV, BBC, and Star TV. ZEE TV was the first Indian enterprise to buy space on that satellite for Hindi programs. In South India too, major media houses such as SUN TV and Eennadu began their foray into television. The entry of satellite channels triggered the rapid expansion of the cable industry that grew from 1.2 million households in 1991 to 11.8 million in 1994. The cable television industry, which had several small entrepreneurs that

skirted the law in providing connections to homes, was brought under the Cable Television Networks Regulation Act in 1995. The law required the registration of all such operators, setting down minimum standards of technical service and a program code. AIR and Doordarshan were brought under the Prasar Bharati Corporation in 1997 with the Prasar Bharati Act. In 1997, the Telecom Regulatory Authority of India was constituted by an act of Parliament to regulate an increasingly complex broadcast industry. TRAI holds policy consultations, and regulates tariffs, interconnection, and quality of service. In 2000, the TRAI Act was amended to establish the Telecommunications Dispute Settlement and Appellate Tribunal for dispute resolution among stakeholders.

In 2000, the government of India changed the laws to allow uplinking and downlinking broadcast signals from Indian soil, which led to the rapid growth in the number of news television channels across the country. Of the 866 private television channels, 383 are news channels.

Today, Indian television viewers have access to global channels such as BBC, CNN, Star TV, and Al Jazeera. Major global entertainment companies such as Viacom, Disney, Sony, and Star TV produce and distribute entertainment programs in regional languages through diversified niche programming. Franchises such as *Who Wants to be a Millionaire*, *Big Boss*, and *Indian Idol* jostle with film and entertainment programs made by Indian channels. Sports and devotional content have emerged as major profit centers for both the Prasar Bharati Corporation and the private companies offering bouquets of specialized TV channels.

New Distribution Systems

The increase in the numbers of channels triggered revenue sharing wars between distributors and the channels that have resulted in a series of inventions and innovations. The emergence of multisystem operators (MSOs) became inevitable as the local cable operators' capacity to invest in technology to supply hundreds of channels came under stress. There are 1,664 registered MSOs and over 100,000 local cable operators providing transmission services to the 836 million viewers. The government of India allows 100% FDI in cable and DTH platforms.

The 2010s saw the push for digitization of broadcasting that expanded the carrying capacity and the quality of signal, in addition to addressability where each individual user is accounted for. The Digital Addressable Systems and the Conditional Access Systems are expected to bring transparency to revenue sharing within the industry and expand choices to the consumer. The industry was beginning to reduce its dependency on advertising and increasing subscription revenues gradually since 2018.

Traditional media such as radio, TV, and newspapers have been dependent on advertising from the government as a major source of their income. This has been an important means of state control of media content, as was commercial advertising.

Ownership

India does not have cross media ownership regulation and does not have a robust system to address monopoly tendencies. Two major trends were observed in the television industry since the mid-2000s. When the television market began rapidly expanding, it was the owners of already entrenched newspapers, such as *Eenadu*, *The Times of India*, and *Anandabazar Patrika*, that started news and general entertainment channels, consolidating already existing heft in the market in print media with television. *The Hindi* and other regional language television and print media account for a large share of ratings and advertising revenue.

Television in various language markets in India also is largely owned by families and not by companies listed on the stock markets, which allows the family enterprises to maintain greater opacity in operations and regulatory conformity. In a lightly regulated environment, corporate governance and transparency of operations have been a much-debated issue in the industry.

The second phenomenon is the ownership of media enterprises emerging mostly from sectors such as real estate, infrastructure, and nonbanking finance companies. Each round of general elections in India since 2000 has seen the emergence of new television news channels started or supported by individuals with overt or covert political affiliations. Analysts have found that less than 4% of the 383 news channels are profitable. This

combination of political and economic power with control over information dissemination in a democracy has become an issue of concern.

Self-Regulation

The television industry, both entertainment and news segments, are regulated by self-regulatory mechanisms that have evolved over the years with varying degrees of success. Broadcasting Content Complaints Council under the Indian Broadcasting Federation regulates content of non-news channels while news content is regulated by the News Broadcasting Standards Authority under the News Broadcasters' Association. Advertising is regulated by the Advertising Standards Council of India. All registered channels are not members of broadcasters' associations and some powerful media houses who were members quit when the regulator received complaints about their channels, thus undermining the self-regulatory process.

The slowdown of the economy that began in 2018 resulted in news organizations closing bureaus and reducing the number of journalists on staff. The COVID-19 lockdown that began in late March of 2020 came before the economy, media, and advertising industries recovered from the 2018 slowdown, and intensified the crisis in media industries, further reducing advertising revenue and leading to job losses.

Online and New Media

Most newspapers and television news channels in India have a web presence now. Some major newspapers such as *The Hindu* have tried going behind paywalls. Television entertainment has given rise to aggregators that offer serials and entertainment for time-shift viewing. According to the FICCI 2019 report, Indians spent 30% of their phone time on entertainment. "Catch-up TV," content of major broadcasters viewed online after the broadcast, accounted for 70–90% of total viewing, and online video viewing grew by 25% to 325 million in 2018. Over 95% content viewed is in regional languages, leading to streaming media services also known as over-the-top (OTT) services investing in regional language content. There are 30 OTT platforms in India.

While news channels are struggling to break even, the online news audience grew to 245 million in 2019, according to the industry group FICCI. As of March 2019, 637 million people in India subscribed to an Internet service, with robust growth of rural subscribers. Of those with a subscription to an Internet service, 536 million had broadband Internet. In 2018, 340 million owned smartphones. Games surpass entertainment, music, and news in download of apps and time spent.

Since 2016, there has been a gradual increase in individuals starting Internet-based channels to offer news commentary, entertainment, and film and literary criticism through blogs and videos. There has been a rapid increase in user-generated content.

The year 2019 saw the emergence of a diversified market of OTT platforms such as Netflix, Amazon Prime, and Hotstar that opened up opportunities for original content. Aha, Arre, Hoi-choi, and several other platforms have opened up opportunities for original content production in regional language markets. These platforms have been launching independent, experimental films made in Indian languages, giving the Indian content global access through subtitling. OTT platforms for music such as Gaana and Spotify have started streaming services in India.

Representation in Media

India has been occasionally riven by religious, caste, and ethnic conflicts for centuries. Populations practicing minority religions, and caste groups considered lower in the social hierarchy practiced in India, have had less representation in power structures and in the media establishments. Recent research has shown endemic underrepresentation of women, marginalized castes, and religious minorities in mainstream media enterprises that leads to exclusion of those perspectives. Since 2000, the mainstream media in India has come under greater scrutiny, including in significant work by scholars such as Robin Jeffrey, for neglecting to address the lack of representation of some sections of the population and rendering the needs of the poor, minority, and marginalized groups invisible in public discourse.

Freedom of the Press

The true test of robust media in a democracy is the extent of freedom the media enjoy. India was ranked 122 in 2010 in the World Press Freedom Index published by Reporters Without Borders but had slipped to 142 in 2020. Instances of journalists being killed (18 in 2018), arrested, and harassed for their work are increasing. In 2019, journalists and editors were threatened, arrested, or killed, and in Kashmir, media were completely shut down with all access to Internet cut for nearly 6 months.

Since 2014, editors-in-chief of prominent national newspapers, *The Tribune* and *Hindustan Times*, have been forced to resign. Journalists losing jobs for ground reporting, instances of journalists being threatened, cartoonists charged with sedition, and netizens being accused of “hurting religious sentiments” in their social media posts have been on the rise. Persecution through arrests and nonbailable jail sentences have become frequent, undermining the constitutionally guaranteed rights to free speech, life, and liberty.

INDIGENOUS NEWS MEDIA

Indigenous media refer to news reporting by and for Indigenous communities. In the United States, organizations such as the Native American Journalists Association (NAJA) are partnering to amplify Indigenous journalists globally. As a result, Indigenous media are thriving.

“Indigenous” is the collective term used globally when referring to communities. However, in Canada, for example, Indigenous peoples may refer to some communities as “First Nations.” In the United States, “Native” and “Indigenous” are preferred in some communities over “Native American,” as these terms reflect the original inhabitants of their areas. NAJA notes it is important to ask the tribe and its members the best way to reference them to support sovereignty and self-determination.

This entry focuses primarily on Indigenous media in the United States, where more than 570 tribes are federally recognized and 60 additional tribes are recognized by states but not by the U.S. government. Topics covered include social media, freedom of the press, coverage by non-Indigenous media, guidelines for reporting on Indigenous communities, and support for future Indigenous journalists.

Society and Social Media: Indigenous-Supported Media

In terms of digital media, social media are not a new concept for many Indigenous communities. In 2018, Mark Trahant (Shoshone Bannock), a long-time award-winning journalist, received the E. W. Scripps School of Journalism Carr Van Anda Award. The award was named after a *New York Times* managing editor and Ohio University alumni, Carr Van Anda. Trahant, now editor of *Indian Country Today* (ICT), outlined eloquently from his research how social media is nothing new for Indigenous communities:

If you have ever been to the Southwest, the ancient Pueblo villages are still intact, most of them built around the 11th century. They had devised an extraordinary communication system built on roads. Pueblos were so aligned, in fact they can see it on satellite today, that they could communicate village-to-village with lights. Lights would go on. Lights would go off. One common zero. And, that is essentially the internet. (“Mark Trahant,” 2018)

In his speech, Trahant also discussed how social media started the first revolution in the United States—the one in 1680. Trahant noted how Pueblo communities protected themselves against Mexican invasion. He said a rope with many knots passed from village to village; each village untied a knot. When all the knots were out of the rope, the communities knew it was time for the revolution. The spreading of messages with signs and symbols didn’t stop in just one area of the country. The *Cherokee Phoenix*, the first Native American newspaper, was printed in syllabary and English. Its mission was to keep Cherokees informed and united. A different form of connectivity can be seen today by searching #NativeTwitter, but the message is still the same—attempting to reach and hear from and about Indigenous people and communities.

Indigenous Media and Journalists

ICT, a national media network, focuses on the message first, which today translates well for mobile technology. To understand ICT, its history

needs unpacking. Tim Giago (Oglala Lakota), editor for *Native Sun News Today* and the first president of the NAJA, originally founded the *Lakota Times*, the name of which he later changed to *ICT*, highlighting its national coverage. In a March 2018 opinion piece on Indianz.com, Giago wrote about frustration with editorial freedom at the publication he started in 1981 and later sold to the Oneida Nation in 1998. Six months before Giago’s editorial, during NAJA’s national conference, Indian Country Today Media Network (ICTMN) won several awards, and as the conference started, the media outlet ended. Now editor, Trahant rallied conference attendees for an impromptu session on ways to reestablish recently shut down ICTMN.

Five months after the conference, the National Congress of American Indians began housing the organization, naming Trahant as its editor. Then, on April 5, 2019, *ICT* announced its move from Washington, DC, to the Cronkite School of Journalism in Phoenix, AZ. Since this move, *ICT*, which dropped the “Media Network” from when it was with the Oneida Nation in New York, rebranded itself as “Digital. Indigenous. News.” Since the move, the San Manuel tribe announced a donation of US\$1 million to support the organization. *ICT* now has national correspondents as well as bureaus in Washington, DC, and Alaska. It also includes well-known names in Indigenous journalism, such as Karen Lincoln Michel (Ho-Chunk Nation), Patty Talahongva (Hopi), Mary Annette Pember (Red Cliff Band of Wisconsin Ojibwe), Joaquin Estus (Tlingit), and Dalton Walker (Red Lake Anishinaabe), as well as former NAJA student fellows and now journalists, Jourdan Bennett-Begaye (Diné), Aliya Chavez (Kewa Pueblo), and Kaitlin Onawa Boysel (Cherokee Nation). In fall 2019, the Associated Press began running *ICT*’s coverage as part of its wire services, which includes, at times, coverage from other U.S. tribal presses.

Today, NAJA includes more than 700 members, including non-Native journalists. Hundreds of Indigenous journalists work for either tribal or nontribal forms of media, such as newspaper, digital, radio, documentary/film, and/or public relations. In 2017, the first established Indigenous affairs desk at a non-Native press emerged at *High Country News* (HCN) by Tristan Ahtone

(Kiowa). HCN is based in Colorado but has reporters all over the country. Ahtone grew the one-person desk to a team of five Indigenous journalists and one non-Indigenous journalist, trained in covering Indian Country. Ahtone wrote in June 2018 seeking pitches for the desk stating HCN searched for content beyond stereotypical stories. There are guidelines today on how to pitch to the desk, including the examples of effective stories. Reports covered in the past year by HCN ranged from a Navajo punk rock band, a drag show, a stick ball tournament, to one tribal politician's support toward, what some might find surprising, a federal politician. Ahtone became editor in chief of the *Texas Observer* in 2020, where he again established an Indigenous Affairs desk. In 2020, KOSU, a central Oklahoman public radio station, also added an Indigenous Affairs desk with Allison Herrera (Salinan).

Non-Indigenous Media Issues

Meanwhile, outside of newsrooms with an Indigenous affairs desk, "otherness" still contributes to non-Indigenous media's assumptions, factual inaccuracies, and decontextualized news coverage.

NAJA continues to produce content and advisories noting when non-Indigenous media produce poor coverage. The organization offers ethics training to newsrooms and conducted these workshops in outlets such as *The New York Times* and the *Los Angeles Times*. When independent non-Indigenous media methodologies don't seem to add up in research and reporting—and, unbiased professional organizations such as the American Psychological Association have noted harm connected to terms repeated in this coverage, specifically connected to mascots—the NAJA board addresses the shortcomings in its newsletters, advisories, and social media messages, along with contacting the transgressing news organization to offer collaboration and/or training.

NAJA advisories created the "bingo card," a list of words often used together to produce stereotypical Indigenous news coverage. NAJA recommends reporters check their coverage against this card. The bingo card includes the following words: alcohol, dancing, a warrior, sexual assault, vanishing culture, reference to the ancestors, drugs, a casino, something sacred, unemployment, horses, spirits or ghosts, diabetes, addiction, drumming, broken families, "plight," poverty, violence, dying language, a reservation, singing, poor education, and suicide.

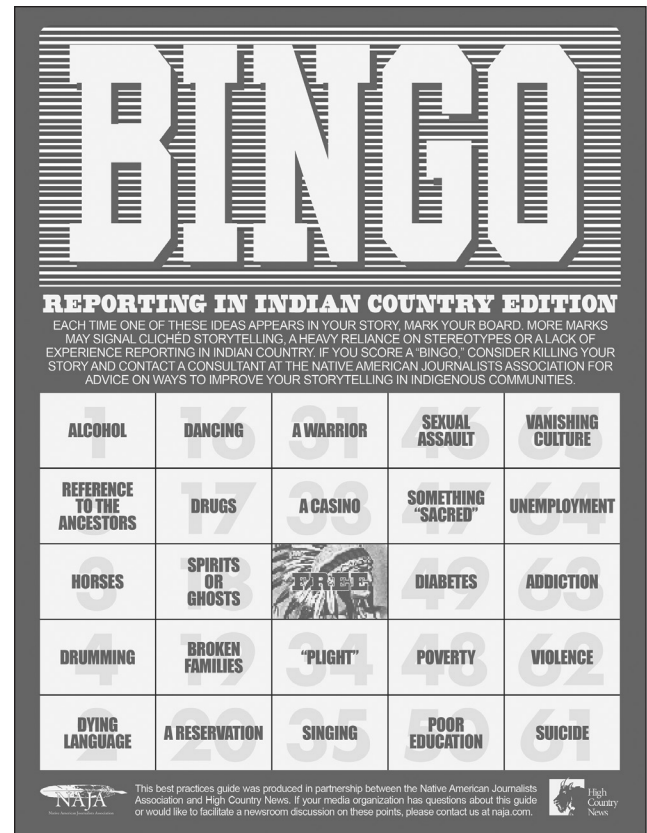

Figure 1. Bingo Card, Reporting in Indian Country Edition

Source: Native American Journalists Association, reprinted with permission.

spirits or ghosts, drumming, diabetes, addiction, broken families, plight, poverty, violence, dying language, a reservation, singing, poor education, and suicide (see Figure 1). The best practices guide's concept: If you have five words aligned horizontally, vertically, or diagonally that would make you win while playing bingo, then you aren't winning in covering Indigenous communities.

Other issues NAJA has addressed with guides include reporting on the Violence Against Women and Indian Child Welfare Acts. Both topics are heavily impacted by and reflect the complexities of tribal jurisdiction. Reporting advisories on Violence Against Indigenous Women (VAIW) and Missing and Murdered Indigenous Women and Girls (MMIWG) assist in understanding the gaps in databases and tracking VAWI, which the U.S. Department of Justice notes is mainly done by non-Native men. The issue leads to problems in seeking convictions and pursuing coverage because

of complex jurisdiction issues where the state has none, the tribes have limited amount, and federal prosecution declinations are high due to a variety of issues.

Gaps between tribal and federal law have led some to create online databases to track issues themselves. In the case of MMIWG, nonprofit organizations, like the Urban Indian Health Institute out of Seattle, analyzed cases across cities and provided content to journalists to help them understand and detail their latest research in reports. Sovereignty is connected to both jurisdiction and the freedom of the press in Indian Country. If someone is not familiar with reporting on Indian Country, they must understand and unpack the important elements of sovereignty, not a term that can be explained in just a few sentences. So, reporters need to spend time to understand sovereignty and its connection to what they are covering—rather than assuming. At sovereignty's root is the following: Tribes determine what is best for them. A tribe determines its members. Tribes have their own languages, laws, and religions, and each is unique.

Freedom of the Press in Indigenous Communities

Connected to self-governing is freedom of the press; but not all Nations endorse this concept in monolithic ways. Press rights differ according to the tribe. NAJA, led at the time by former president and former John S. Knight Fellow at Stanford University, Bryan Pollard, created the Red Press Initiative, funded by the Ford Foundation. To research this topic, NAJA partnered with the Committee to Protect Journalists, Reporters Without Borders, the Democracy Fund, the Indigenous Media Freedom Alliance, and the Reporters Committee for Freedom of the Press. The Red Press Initiative examines “accurate and contextual reporting” and specifically where tribal members receive their news and how staff, politics, advertising, and budget may impact what is reported on and by whom.

Still on the political radar today is *Muskoke Media*, which won the free press award from NAJA in 2016. In late 2018, the Muscogee (Creek) Nation National Council revoked its press

freedoms during an emergency meeting. The department's then manager, Sterling Cospo (Muscogee Creek), voluntarily stepped down as it reverted toward being a public relations arm of the tribe. Since then, there has been reinstatement legislation attempts after the initial repeal. Cospo then went to work as a program manager for NAJA. In 2020, the Muscogee Nation restored free protections to its tribal code, according to NAJA, and in 2021, it added a ballot voting question that if this constitution amendment passes, would require its citizens to approve any free press law changes.

Meanwhile, another former *Muskoke Media* employee, who was editor before the free press ordinance became law in 2015 and later a Muskoke Media board member, Rebecca Landsberry-Baker (Muscogee Creek), has worked for NAJA for almost 8 years, serving as executive director for close to 5, as of 2020. To amplify visibility of the redaction of Muscogee (Creek) press rights, the NAJA board and staff disseminated information to NAJA members, sharing information on future bills, votes, and the impact on the tribe. The advisories included citing the United Nations' Declaration on the Rights of Indigenous Peoples:

It is also the position of NAJA that Principal Chief Floyd and members of the Muscogee (Creek) National Council are in violation of UNDRIP which states in Article 1: “Indigenous peoples have the right to the full enjoyment, as a collective or as individuals, of all human rights and fundamental freedoms as recognized in the Charter of the United Nations, the Universal Declaration of Human Rights and international human rights law.” This includes the right to freedom of opinion and expression. (“NAJA asserts,” 2018, para. 9)

As of 2021, NAJA has highlighted three free presses: Cherokee, Osage, and The Confederated Tribes of the Grand Ronde. The *Cherokee Phoenix* had the first independent press act in 2001. The *Phoenix* has also won NAJA's Elias Boudinot Free Press Award, awarded almost annually along with hundreds of other NAJA media awards at its annual National Native Media Conference. At times, the conference is in partnership with other national media and other organizations, such as

last year when it partnered with the Fourth Annual Conference on Native American Nutrition.

Reporting on Indigenous Communities

In general, NAJA recommends that reporters refer to a tribe specifically. On its website, it lists Indigenous terms as well as an Indigenous *Associated Press News* style guide. In short, these state that one Indigenous person should not speak for all Indigenous people. As reporter and NAJA board member, Graham Brewer (Cherokee Nation) stated, tribes shouldn't be lumped together even in news headlines. On his Twitter page, Brewer, who in 2021 became an NBC News Digital reporter, gives an example of rewriting an April 2019 *The Washington Post* headline that read:

This Native American inscription was found deep inside a cave. Two centuries later, scholars think they understand its meaning.

Brewer's rewrite:

This CHEROKEE inscription was found deep inside a cave. Two centuries later, scholars think they understand its meaning.

The NAJA guide also notes that Indigenous is spelled with a capitalized I, as it refers to people, not plants. NAJA has also been expanding itself and its guides internationally, partnering with the Global Investigative Journalism Network to create a downloadable guide with tools for Indigenous investigative journalism. In 2021, NAJA released reporting guides for First Nations, Inuit, and Métis communities in three languages: English, Spanish, and French.

Like most newsrooms, sourcing is essential when covering Indigenous communities. In a 2020 NAJA Media Spotlight report, the organization's research found non-Indigenous news often relied on officials and non-Indigenous sources to speak for Indigenous people and communities. Another stark finding: "More than half of national media coverage of Indigenous peoples in the U.S. surveyed relied on clichéd themes and stereotyping terminology." (NAJA Media Spotlight, 2020, para. 2). However, there was an upside to the

findings, a national news network reposted Associated Press stories by a former NAJA president and *Seattle Times* reporter Mary Hudetz (Crow), who then worked for the Associated Press. Having this sort of representation in non-Indigenous newsrooms can be highly valuable to non-Indigenous media who have struggled with covering Indian Country.

Next-Generation Indigenous Journalists

Leaders like Hudetz, as well as other NAJA, members have laid the groundwork to advocate for and support the next generation of storytellers in Indigenous and non-Indigenous newsrooms. NAJA crafted a pathways program to support students and professionals. At the student level, programs cover high school, undergraduate, and even graduate students (for college credit). For the student fellowship, prior to the National Native Media Conference, students are paired with a mentor and attend webinars held by journalism experts, while hosted by a NAJA student mentor-in-training who has already been through the student fellowship at least once. During the conference, the students cover the event as well as stories connected to Indigenous people and communities. Some students continue this work for college credit; and in connection with their university, they may receive it for undergraduate or graduate credit. As part of the pathways system, students may return as a NAJA fellow; however, students must submit a portfolio showing how they grew since the conference and detail their next hopeful steps in the program. Several layers to the pathways system are student and professional focused. Pathways also support transitioning members between fields or professionals new to the business.

In terms of Indigenous people in non-Indigenous news organizations, the numbers are stark. On average, these numbers, as the American Society of News Editors' census pages note, have been over the years in the decimal points of less than 1%. Partnerships between professionals and student organizations can provide an entryway to more inclusivity within non-Indigenous news organizations.

For example, several NAJA partnerships materialized through academia. Columbia University provided funds to support student attendance at the NAJA national conference. In 2021, New York University's journalism institute offered full tuition scholarships to one of its 10 graduate-related programs. On a smaller scale and before the COVID-19 pandemic of 2020, Ohio University, at one point, created within its journalism school a Scripps Scholar with NAJA. These funds supported a NAJA college student fellow attending in a leadership capacity the Scripps journalism school's high school workshop and also the NAJA national conference. While at Ohio University, the student learned about a possible graduate or another form of advanced degree. Through another initiative, NAJA's sustaining membership, universities or organizations may join and receive incentives, such as multiple memberships as well as opportunities to conduct webinars with all members. Prior to the COVID-19 pandemic, universities such as Arizona State University offered to host the 2020 national NAJA conference.

Within the journalism industry—and in academia—complaints emerge about the difficulty some non-Indigenous news managers have finding Indigenous students or Indigenous reporters. However, organizations such as NAJA could provide these organizations with a list of Indigenous reporters. For example, the Institute for American Indian Arts has journalism alumni who have excelled, including two NAJA board members, Christine Trudeau (Prairie Band Potawatomi Nation) and Ahtone. Haskell Indian Nations University has in the past won numerous awards at the Native American National Media Conference. Some of these students go to Haskell and are taught by Rhonda LeValdo (Acoma Pueblo), a former NAJA president and a working journalist serving as a host for Native Spirit 90.1 FM KKFI-KC and as a reporter for *National Native News*.

More than 30 tribal colleges exist in the United States. The Center for Native American and Indigenous Research (CNAIR) at Northwestern University's director is a NAJA member, Dr. Patty Loew, (Bad River Band of Lake Superior Ojibwe) and CNAIR's associate director community outreach and engagement, Pamala Silas (Menominee/Oneida) is a former NAJA

executive director. NAJA has also reinvigorated its Project Phoenix high school program in a certificate form; curriculum may be added to current existing high school programs at universities to professional national news organizations. So, there is a full circle support in the pathways system, from high school through advanced graduate degree to professional jobs in transition in order to support Indigenous voices engaging and providing ethical content.

Final Thoughts

As academics and newsrooms think about reporting on Indigenous people and communities, as the 2020 NAJA Media Spotlight report highlighted, they should think about who is speaking about Indigenous communities and in what ways. Sourcing, frames, and visuals matter from the headline to the hashtag. There are Indigenous people in every facet of journalism and public relations, such as Jennifer Bell (Citizen Potawatomi Nation), the Director of Public Information at Citizen Potawatomi Nation to freelancer Lenzy Krehbiel-Burton (Cherokee Nation) who has written for tribal to local to regional to national media outlets, including tweeting a reporter's notebook of events, as they happened when covering tribal council meetings from her handle @lenzykb.

INDONESIA

Indonesia's news media serve a population of over 267 million people, most of whom live on the archipelago's main island Java. Indonesia is home to the largest community of Muslims in the world and has a linguistic diversity of more than 700 languages. The development of media and journalism in the country was strongly influenced by its historical, cultural, political, economic, and legal contexts. News media have operated under tight political restrictions for decades until Indonesia, after a peaceful revolution and takeover by a reform government in 1998, started its—still unfinished—transition to democracy.

Indonesian news media and journalism have been particularly influenced by the advancement of communication technologies and the popularity of the Internet. The Internet, which in the 1990s was used to spread critical journalism content at the time when the news was subjected to tight political control, has become the most popular channel as its affordances allow easy access to news and information. It also influenced journalists' work routines, providing better access to news sources and more options to sell and promote news products. In 2020, the Indonesian Internet Service Provider Association (APJII) indicated that about 64% of the country's population, or around 170 million people, have access to the Internet, with a majority of them accessing it through mobile phones.

Easy access to the Internet also aided the birth of citizen journalism through social media channels. During the 2014 presidential elections, as well as during the 2017 elections for Governor of Jakarta, social media have demonstrated significant power in the public sphere by driving citizen journalism and social activism. While this situation democratized the production and flow of news in Indonesia's public sphere, it also had several adverse consequences, such as easy spread of content promoting sectarianism and racism. Furthermore, journalists are still targets of violent attacks. In 2017, the Alliance of Independent Journalists, for instance, reported between 20 and 80 attacks on Indonesian journalists per year over the last decade, many of which were perpetrated by police and the military.

This entry offers a brief history of journalism in Indonesia and a description of journalists in the country based on recent survey data.

Journalism and Media in Indonesia: A Short History

The history of Indonesian journalism dates back to the early 20th century and is closely related to the rise of nationalism during Dutch colonial rule. The first Indonesian newspaper, *Medan Prijaji*, started publishing in 1907. Along with other newspapers that came around at the same time in different parts of the country, newspapers were used to spread nationalist ideas and feed emerging nationalist movements, such as Budi Utomo and

Perhimpunan Indonesia. However, after the crash of the communist uprisings in the mid-1920s, colonial authorities tightly suppressed journalists and the press.

When Indonesia declared independence in August 1945, political journalism started thriving again. Within the first few years of Sukarno's presidency (1945–1967), at least 124 newspapers were newly founded. No censorship existed due to the transitional period from Dutch and Japanese occupation to the Indonesian government, while at the same time, media supporting the Dutch colonial rule continued to exist with the sole purpose of propaganda. Radio Republik Indonesia (RRI), a chain of state-run radio channels, was established in 1945. Televisi Republik Indonesia (TVRI) followed in 1962. The launch of the first communication satellite in 1974 supported the emergence of private radio stations across the country. Private radio stations were permitted to operate under strict government control. Private television stations started broadcasting in 1988.

The government began experimenting with press restrictions in the mid-1950s with various types of laws. The 1956 military regulation, for example, enabled authorities to imprison journalists based on charges of defamation of the president or vice president or for disseminating any kind of news that the government believed could create social chaos or political unrest. Several newspapers, such as *Abadi*, *Pedomani*, and *Nusantara*, were banned from operation around this time. The New Order regime under President Suharto, who rose to power in 1966, imposed even stronger restrictions on the press. Additional regulations included publication licenses for all kinds of print media, restrictions on the formation of journalists' associations, and the introduction of the development journalism paradigm as a professional norm to the practice of journalism. Under the notion of "*Pancasila* journalism" (*Pancasila* is Indonesia's official national ideology), journalists were expected to support national development as well as to educate the public and avoid any reporting that could ignite interethnic, interreligious, interracial, and intergroup conflicts (commonly abbreviated SARA). Those who chose not to follow this norm and disobey state restrictions risked their media licenses and, in a number of cases, faced imprisonment. Government control

over the media, which was instituted through a separate Ministry of Information, influenced journalists' perceptions of their roles and nurtured a common practice of self-censorship and "writing between the lines" for several decades.

Journalists started enjoying press freedom only after President Suharto lost his power in 1998. The reform government introduced a new, liberal Press Law in 1999, abolished the Ministry of Information, and, with the 2008 Public Information Transparency Law, marked an open government by guaranteeing journalists access to government information. The government also allowed the establishment of an independent Press Council in 2000, marking the introduction of a media accountability framework. Since then, the number of media outlets increased rapidly after the fall of the New Order government. The number of print media, for example, skyrocketed from 289 in 1997, the year before the New Order government lost its power, to 1881 in 2001. The number of radio stations doubled between 1998 and 2002. The number of private television stations also increased to 10 national channels. These stations then rebroadcast their programs through local television stations across the country. Around this time, more individuals owned media outlets that offered journalism content and more media institutions employed news producers and journalists who were not necessarily trained.

Online-based journalism took a different path in 1994, with former journalists from banned media outlets (such as *Tempo*, *Detik*, and *Editor*) using the Internet as a way to support a free flow of information and alternative voices. The formal status of state-run RRI and TVRI also changed to public service media. In addition, the government established an independent broadcasting commission to self-regulate the country's broadcasting system and allowed the creation of independent journalist associations. Since then, at least 29 independent journalism associations have been established. These organizations also have teamed up to create an Indonesian journalism code of ethics.

Recent years have seen an increased concentration of media ownership and intensified ties between media owners and political parties. Despite media ownership being redistributed from the cronies of former President Suharto to a larger

number of media entrepreneurs, media ownership tends to be dominated by oligarchs with political ambitions, which is particularly true for larger national television channels. Under such circumstances, Indonesian journalists often cater to the needs of the archipelago's economic elite and their political allies. This situation has not only threatened press freedom and freedom of expression, but it also opened the door for unethical practices in journalism.

Journalists in Indonesia

The development of media and journalism also impacted training and education for journalists. Prior to the reform era, formal education through journalism majors in higher education was not available. Professional journalists learned by doing or enrolled in short journalism courses offered by professional journalists. International organizations tried to fill the gaps by introducing new journalism practices through foreign trainers. However, such media development efforts turned out challenging due to the often different, if not incompatible, value systems shared by the trained journalists and by their trainers who came from different cultures. Today, journalism has been widely offered in university settings as well as in further professional education. As of 2021, the National Accreditation Body for Higher Education (BAN-PT) listed 12 accredited journalism programs run by universities across the country. In addition to the degree programs with accreditation, there is a plethora of journalism-related study programs offered by the numerous private universities and institutions of higher education below university level (notably, academies and universities of applied sciences).

According to a 2015 survey by Nurhaya Muchtar and Masduki, there are approximately 42,000 journalists working across the archipelago. Only a relatively small proportion of the 663 interviewed journalists were women (21.5%). On average, Indonesian journalists are 34.4 years old and obtained a relatively high level of education, overwhelmingly a bachelor's degree. Most interviewed journalists held full-time job positions (69.2%), another 8.2% of the respondents indicated that they had part-time employments, and 17.2% worked as freelance journalists.

Indonesian journalists are fairly experienced. On average, they have worked for 8.5 years and about half of them have more than 7 years of professional experiences. Most journalists work on various topics and subjects (66.6%), only a third of the journalists specialize in a specific area of coverage, such as politics, health, or economy. Most journalists are members of a professional association (69.5%). Job satisfaction and professional commitment remain reasonably high—despite low pay and often difficult working conditions.

With regard to their perceptions of professional roles, Indonesian journalists find it most important to report things as they are, educate their audience, promote tolerance and cultural diversity, let people express their opinions, and advocate for social change. According to Thomas Hanitzsch and Dedy Nur Hidayat, journalists very much embrace the idea of journalism serving as a Fourth Estate in democracy, and they are strongly oriented toward impartiality, neutrality, factualness, verification, and credibility. The partisan style of journalism that endured during Sukarno's regime seems to have vanished from Indonesia's newsrooms. It is only their slightly greater appreciation of interventionist reporting—that is, to influence public opinion and advocate for social change—which sets Indonesian journalists somewhat apart from news workers in Western countries. And although most journalists in the country were socialized into the ideology of the media as being “free but responsible” (Assegaft, 1983, p. 12), there seems to be no particularly strong developmental orientation shared by Indonesia's news people.

According to the aforementioned 2015 study, Indonesian journalists show a strong commitment to professional standards of journalism ethics. Journalists generally agreed that journalists should always adhere to the code of professional ethics (98.9%). Most journalists disagree with the idea that moral standards should be set aside if extraordinary circumstances require it (78.1%) and that what is ethical depends on the specific situation (60.6%) and is a matter of personal judgment (77.4%).

Like many of their colleagues in other countries, most Indonesian journalists justify controversial reporting practices based on harmless

deceptions, but only a few of them would consider methods of investigation that involve serious offense and harm. Most journalists believe that using hidden microphones or cameras (74.1%) as well as paying people for confidential information (60.1%) and getting employed in an organization in order to get inside information (56.4%) is justifiable, at least on occasion. A large number of journalists also believe that using government or business documents without authorization (49.8%), claiming to be somebody else (30.0%), and exerting pressure from unwilling information in order to get information (24.7%) is justified, at least under certain circumstances.

Journalists in Indonesia also reported that they had limited professional autonomy. Only 38.2% said that they had a great deal of freedom in selecting news stories. About 44% of the journalists reported that they had complete freedom in deciding what aspects to emphasize in news stories. Journalists in state-owned media organizations feel substantially less autonomous than their colleagues in private media where commercialization has become an important driving force. Altogether, Indonesian journalists feel that their work is influenced by professional, procedural, and organizational factors more than by political and economic forces. One specialty of Indonesian journalism is the relatively strong influence of religious leaders, a tendency that reflects the country's multiethnic and multireligious society.

INFOTAINMENT

Infotainment is a neologism that refers to the blurring between information and entertainment in news and current affairs programming, whether it be in the selection of news stories (e.g., more emphasis on celebrity gossip, crime stories, and human interest pieces) or in their presentation (flashy graphics, sound effects, and sensationalism).

The media environment in the United States and around the world has undergone dramatic changes since the late 1970s and early 1980s. Not only have technological innovations changed the way citizens consume various media, but the structure of the industry has changed as well. Growing conglomerations of media companies have led to a dramatic increase in information available and in competition for audiences. Newspaper readership is down as is viewership of the major network news programs. As audiences turn to Internet-based news sources, media companies are searching for ways to maintain if not expand their audience shares while increasing advertising revenues. News divisions of media companies,

once treated by management as insulated from market pressures, are now considered additional sources of revenue. These economic challenges have helped blur the news-entertainment distinction as news producers rely on entertainment value to “sell” news stories.

Infotainment is a buzzword, first popularized in the 1980s, and commonly used by communications scholars and critics to describe the erosion of the line that once divided news (information) and entertainment. Historically, news organizations maintained a distinction between “hard” news and entertainment, or “soft” news, programming. Infotainment may be used as a synonym for “soft” news, defined broadly as, “a residual category for all news that is not ‘hard,’ as a particular vocabulary in presenting the news ... and as a set of story characteristics, including the absence of a public policy component, sensationalized presentation, human-interest themes, and emphasis on dramatic subject matter, such as crime and disaster” (Baum 2003, 92).

This kind of content is often the result of standard journalistic practice combined with market influence. Researcher Doug Underwood describes five ways in which news and marketing goals interact. He argues that the “marketing and bottom-line influence” upon today’s media can be seen in the following:

[T]he tabloid techniques adopted by ratings-fixated local television stations and the network television newsmagazines . . . the embrace of splashy visual techniques and news-you-can-use items by newspapers desperate to stem a four decade long readership slide . . . the explosion of salacious copy and scandal coverage in traditional media outlets and on the Internet . . . the mixing of entertainment, crime, and gossip with the news by television organizations trying to hold onto their audience; and the ‘synergy’ of relentlessly expanding media conglomerates eager to treat the news as a ‘product’ to be recast for the publicity, promotional, and marketing purposes of their integrated media holdings. (Underwood 2001, 100)

Defined as such, infotainment includes daytime television shows such as *The Oprah Winfrey Show*, entertainment news programs like

Entertainment Tonight, talking-head forums such as *Hannity and Colmes*, and late-night talk shows including political punchlines from late-night host David Letterman or the satirical stylings of *The Daily Show with Jon Stewart*. These types of programs convey political and public affairs information through humor, discussion panels, and feature stories, and try to do so in an entertaining, eye-catching manner. So do such news magazines as NBC's *Dateline*, which increasingly stress crime and human-interest stories as opposed to hard news.

News programming and entertainment are not necessarily opposites, however. Entertainment television often has informative elements and news can often be entertaining in its presentation. It is now common for 24-hour American cable news channels and television network broadcasts to underpin stories using graphics, sound effects, and slogans. The presentation of news items in such a stylized, eye-catching manner is not new, nor is it limited to electronic media. *USA Today* has since 1981 packaged the news using graphics, charts, and flashy color photographs, putting as much or more emphasis on style than substance.

Media critics argue that by providing content in this manner, media are failing the public as a source of reliable information necessary to the democratic process. Others suggest that soft news and infotainment might actually be good for consumers. Researcher Matthew Baum claims that not only do large numbers of Americans consume soft news, but soft news programs also attract viewers normally not interested in political programming. By "piggy-backing" information about foreign policy and politics onto entertainment-oriented programs, these normally inattentive soft news consumers may actually gain information.

Media mergers promote the atmosphere in which infotainment thrives. To take just one example, after America Online and Time Warner joined forces in 2000, the top executives at Turner Broadcasting, the parent company of CNN, were replaced by entertainment industry insiders with very little news experience. Large media conglomerates with diverse holdings including film production houses, magazines, book publishing companies, newspapers, and broadcast stations often use these outlets to promote their products. This cross-promotion of media holdings has made

its way into news broadcasts. News anchors often interview celebrities in order to promote new films that are owned by the same parent companies.

Infotainment, while entertaining and good for the bottom line, takes up time and space that might otherwise be filled with more important ("serious" or "hard") news items. Put another way, what is *not* making it on the air or into the press? One reason infotainment is so appealing to news editors is that it is unlikely to offend viewers. French sociologist Pierre Bourdieu concluded, "part of the symbolic function of television, in the case of the news, for example, is to call attention to those elements that will engage everybody—which offer something for everyone. These are things that will not shock anyone, where nothing is at stake, that do not divide, are generally agreed on, and interest everybody without touching on anything important." When viewers, and the advertising dollars they bring, matter, the temptation to air infotainment-oriented programming is heightened.

The rise of infotainment is mainly a result of market forces and pressure to constantly grab the viewer's attention and keep them tuned in. One reason for the increase in "news you can use" items, feature stories, and localized topics is the perception of news consultants and editors that this is what the public wants. CNN correspondent Christiane Amanpour once told a group of news executives,

Think of how much more of a contribution we could make to this great society if we weren't so dependent on what I call those hocus-pocus-focus awful groups who tell us what people are not interested in. . . . time has proven that all the gimmicks and all the cheap journalism can only carry us so far. (quoted in Anderson 2004, 29)

Whether consultants, market researchers, and news "gatekeepers" are correct is debatable, but one result of the glut of infotainment is less coverage of government and the bureaucracy. Although their decisions may be vital to local citizens, city council or school board meetings rarely sell newspapers; scandals involving Hollywood celebrities do. If the role of the press in a free society is to give the public the information they *need* to be self-governing, in addition to the programming

they may *want*, the implications of infotainment-saturated news content may be having large and lasting effects.

INNOVATION JOURNALISM

Innovation journalism (InJo) is journalism covering innovations. It refers to journalism that focuses on reporting how innovations happen in societies, and emphasizes the importance of providing precise language and illustrative narratives that enable public discussions about new technological trends and their social implications. In addition, InJo has a future orientation and an objective of using new

digital tools for journalistic storytelling. InJo as a reform movement was in its heyday from 2004 to 2011.

Horizontal Approach

To understand innovation processes, a journalist needs to draw knowledge from several different special fields such as technology, economics, politics, science, culture, and law. In this respect, InJo challenges traditional news beat systems. It aims at producing thought-provoking and critical journalism about complex topics such as nanoscience, laser technology, the Internet of Things, and medicine. Ultimately, InJo is a reformation movement for technology and business journalism.

InJo is interested in different levels of processes. At the micro level, an article could focus on a solo innovator or team of innovators, one innovation process, or one innovative company or organization. At the macro level, more general approaches as well as broader themes are reported such as industry-wide perspectives, innovation ecosystems' analyzes, or national innovation strategies. An article on a development process, for instance, might focus on the development of a new drug and its introduction to the market, while an article analyzing a local business ecosystem could describe the clean technology (cleantech) sector in California's Silicon Valley.

The term *innovation journalism* was coined by Swedish physicist David Nordfors in 2003, when he was working at the Swedish Agency for Innovation Systems (Vinnova). Nordfors was among the first to notice that even if technological and social innovations were argued to be key drivers of economic growth globally, journalists in general did not cover topics that were related to innovation processes. According to Nordfors, innovations fell between many traditional news beats.

InJo Fellowship Program as the Main Tester

To test the InJo concept in practice, whether innovation could be its own news beat or not, Nordfors's employer Vinnova started to fund a special InJo program. It consisted of academic research and a fellowship program initially aimed at educating mid-career Swedish technology and

economic reporters as innovation journalists. Later mid-career journalists from Finland, Slovenia, Mexico, and Pakistan joined the International Innovation Journalism fellowship program.

From 2004 to 2011, the InJo Fellowship Program was affiliated with the Stanford Center for Innovations in Learning (SCIL) and hosted by Stig Hagström (1932–2011), a professor emeritus of materials science and engineering. Later SCIL was first merged to industry partners program, Media X-program, and finally to the H-STAR (Human Sciences and Technologies Advanced Research) Institute at Stanford. Situated in the heart of Silicon Valley, the InJo Fellowship Program had a vantage point on the world's leading innovation ecosystem. It lasted 5 to 6 months annually, from spring to early fall, and was divided into three phases.

The program started with an introductory period at Stanford University, then was held off-campus at the Stanford Research Institute (SRI). After academic lectures, discussions, and company excursions, the fellows joined different hosting U.S. newsrooms, mainly in the West and East coasts. For example, Bloomberg, *Fortune* magazine, the *San Francisco Chronicle*, *PC World*, CNET, Red Herring, and VentureBeat hosted several InJo fellows. Finally, the fellows co-organized with founding Executive Director David Nordfors the Innovation Journalism Conference at Stanford.

The conference consisted of keynote talks, paper presentations, panel and round-table discussions, and workshops. All the fellows' papers and academic research papers were published in an open access publication *Innovation Journalism* (Innovationjournalism.org). Many of Silicon Valley's innovation veterans and luminaries contributed to the conference, for example SRI's Douglas Engelbart and Google's Vint Cerf. Also, prominent Silicon Valley-based tech reporters such as *The New York Times*' John Markoff, the *San Jose Mercury News*' Dan Gillmor, and ABC News' Michael S. Malone gave keynote talks or participated in the panel discussions.

The annual Innovation Journalism Conference acted as the center of a social network interested in developing InJo activities around the world. It attracted not only journalists but professionals from higher education to public policymakers and

public relations. For example, Slovenian entrepreneur and politician Violeta Bulc contributed to several InJo conferences. She acted later, for example, as the European Commissioner for Transport (2014–2019).

Innovation Journalism, an open access publication, served as the main communication platform for journalism fellows and other developers. As often happens with new initiatives and ventures, several "schools" were created during the active years of the InJo program, all having slightly different emphases. For example, in Germany the focus was mainly on innovation communication, whereas in Finland the importance of social innovations and future orientation were highlighted.

The InJo Fellowship Program was followed closely by academic scholars. Several rounds of interviews and content analysis were conducted during the active years of the program. Based on the results of these studies, almost all the fellows were critical toward the idea that InJo could be a new beat in the newsrooms. According to the fellows, innovations were considered too complicated, long-lasting processes to become its own journalistic beat. In similar fashion, a content analysis of 410 InJo stories made in 2004–2008 by 38 fellows showed that their work was still quite close to that of traditional business and economy reporters. News was clearly the main genre of the fellows' stories, big technology companies dominated as sources, and the future-orientation was rather weak. However, the fellows actively tested new digital tools and applications such as blogs in their reporting.

During its tenure, the fellowship program educated about 50 mid-career journalists, mainly from Sweden and Finland, but also some journalists from Slovenia, Mexico, and Pakistan. After their fellowships, many journalists advanced in their journalism careers while others changed their professions to work in public relations or as academic researchers and educators. Based on several rounds of research interviews, one common pattern for example among the Finnish InJo fellows was to change their jobs after the return to their home country.

Learnings and Legacies

In the end, InJo did not get enough support in the newsrooms as its own news beat. Especially after

the financial crisis of 2007–2008, specialist reporting from foreign reporting to science journalism seemed to be too expensive and luxurious, suitable only for the most resourceful news organizations.

However, the interplay of innovation and journalism did resonate for example with other reform movements such as constructive journalism and data journalism. In addition, educationally speaking, Stanford University's John S. Knight Fellowship program transformed its curriculum successfully toward innovations in journalism at the turn of the 2010s.

InJo was introduced as a new academic research area for journalism studies via annual Stanford conferences, which had its own academic tracks from 2006 to 2011. In addition, InJo as a new concept in journalism studies was introduced at the International Association for Media and Communication Research (IAMCR) conferences in 2008 in Stockholm, Sweden, and in 2010 in Braga, Portugal. After these conferences, IAMCR started to pay more attention to the importance of innovations in journalism studies. The need for constant adaptation and innovativeness are an essential part of the survival strategies of many news organizations. In this way, InJo, at least a small part, paved the way for the contemporary journalism studies via emphasizing the importance of the interplay of innovations and journalism.

After the InJo program ended in 2011, many national InJo initiatives, which were funded by different national foundations, started to fade away. For example, in Finland, the Association for Innovation Journalism was founded as the first and only of its kind in the world in the year 2007. During its active years, the Finnish InJo Association organized several meetings and excursions for its members. Until the year 2012, the association awarded annually InJo crystals for the best innovation stories published in Finland. The awarded stories were long reads or series published by national or regional newspapers. Their topics varied from environmental reporting to local clusters of new tech companies. The association was discontinued in 2017.

Clearly, InJo as a practice demands more time than average news reporting to fulfill all its ambitious aims. To understand often long-lasting innovation processes, long reads, feature formats,

and series would better suit InJo than short news bites.

Perhaps, the best examples of contemporary InJo one can find regularly are from the British magazine *The Economist* (it calls itself a “newspaper”). *The Economist*, uncommonly, has its own research staff at the Economist Intelligence Unit that provides thoughtful pieces often mixing economics, politics, and culture in order to understand certain industries or societal processes. In addition, *The Economist* publishes annually a special future-oriented issue; the 35th edition was “The World in 2021.”

INSTAGRAM

Originally developed as a means for people to connect, make plans, and play games, Instagram has evolved into one of the most widely used social network sites in the world with more than 1.2 billion users as of late 2020. Instagram offers an array of communication options including photo posts, videos, memes, GIFs, live video sharing, longer form content sharing (i.e., IGTV), archiving, commenting, and direct messaging. These features, along with Instagram's easily accessible and widely used geo-tagging and hashtagging options, have collectively helped the social network site become an important news and information sharing platform while promoting new forms of engagement among news organizations, journalists, and news audiences.

As news organizations continue their decades-long efforts to effectively thread social network sites into journalism, Instagram has evolved into a space where users can engage with news and information in transformative ways that extend beyond its primary use as an entertainment tool. Where the internet offered news audiences the chance to consume and comment on the news in near-real time at the turn of the 21st century, Instagram and related platforms such as Facebook, Twitter, and TikTok now give users the power to consume, comment on, and create news content as it happens. Many of these users have become news influencers, gaining larger followings without working for or with news organizations and often without much, if any, journalistic training or background. This comes as part of journalism's shift toward richer audience engagement and the acceptance of content created by nonjournalists, a turn which began in the late 1990s but only gained traction with newsrooms more widely nearly two decades later.

Instagram now ranks as one of the most popular and widely used social network sites in the world and has an especially American user-base given its beginnings in the United States. According to the Pew Research Center, one in seven adults get their news from Instagram as of 2020 with a higher frequency among women and users under the age of 50. This falls in line with Instagram's younger demographic, which is part of a

user-base that is expected to generate close to US\$20 billion in ad revenue for the social network site in 2021 and continues to reshape how journalism is created for and shared across Instagram. This entry examines Instagram's history and evolution, summarizes critiques of the platform, and explores its impact on news production and circulation.

History and Features of Instagram

Instagram began in 2010 as the creation of computer programmer Kevin Systrom and software engineer Mike Krieger, who combined their interests in social network sites to create a space where individuals could "instantly" share images and text in a quasi-"telegram" style (hence the name, Instagram). Users initially could create a public or private account with the mobile app and take or upload photos in a grid format that appeared below a brief user bio. Other users could like or comment on those uploads. More than 10 million people downloaded the app in its first year as Instagram expanded its sharing capabilities to make the social network site more compatible with existing photocentric platforms such as Flickr.

In 2012, Instagram was purchased by Facebook for more than US\$1 billion in cash and stock and added several features in the 8 years that followed. Those included more filters and borders for photos, increased privacy settings and controls, improved means for linking content with external apps and internet sites, hashtags and geotags that allowed users to find similar content and users to engage with, archiving capabilities, video sharing, and longer form content sharing.

Such changes have allowed news organizations and journalists to create and share news content in relatively new ways. Beyond breaking news as it happens and providing deeper context through longer form posts, news organizations and journalists are able to brand themselves and their style of journalism through their bios and content while also engaging more directly and responsively with other users. Such responses may come in the form of comments below posts, user engagement with hashtags created for specific content, user-created content to go along with those hashtags and other news stories, and engagement in polls, surveys, questions, and nearly live streams

posted by news organizations and journalists. News organizations have also begun experimenting with more ephemeral content that can be consumed and liked or engaged with in a matter of seconds. This was especially apparent during the U.S. presidential election in 2020 when many news organizations hosted virtual town halls, quick takes, and political polls on Instagram and during the global pandemic that struck in 2020 where news organizations and journalists brought updates 24/7 to their followers. Much of this content was posted as events happened and was only available for 24 hours as part of the platform's "stories" function before disappearing from Instagram or being archived.

Journalists not only utilize Instagram to interact with other users, including readers and possible sources, but also use the social network site to share photos and personal details of their lives. Photos, videos, and other content posted on Instagram offer a look into journalists' professional and personal lives, and while they are not casual in the sense of unedited or unplanned posts, they show moments worthy of documentation that are not necessarily professional in nature. Journalists' interactions on Instagram continue to blur the line between personal and professional practice, aided by the platform's format and functionalities, along with the journalist's preferences.

Similarly, users also utilize Instagram to share personal and professional content, with users increasingly professionalizing their social media presence. Users began cataloging their everyday lives with the use of hashtags and geotags, and while not originally marketed as a business tool, many individuals began to use Instagram to build their own brands around their lifestyles. Aided by Instagram's 2016 update allowing users to choose whether they wanted to maintain their personal account or switch to a business account which offered analytics, users began to establish themselves as professionals on the platform. In doing so, they've found ways to comment on, share, and create the news. Users saw the value in sharing their lives on Instagram and began building large followings, creating a persona popularly known as the social media influencer. Not only do influencers collaborate with brands and promote products and services for them, they spread beliefs and ideologies and even create

their own goods to sell to their followers within their own specific niche.

More specifically, news influencers act as journalists with very little journalistic training or background. The increased number of news influencers on Instagram has challenged traditional boundaries of what a journalist is and what constitutes journalism. As these nontraditional journalistic actors emerge on the platform, they reach broader audiences and learn more about them through the tools offered by Instagram. Instagram's "Insights" provides detailed information about one's followers and content engagement and offers the opportunity to turn Instagram posts into ads directly in the app itself. Influencers can tag certain products and services using a sticker and once followers tap the sticker, they're taken directly to the website where the product is located, allowing them to shop directly on Instagram. These features are also supplemented through Instagram's algorithm as it learns the accounts users are most interested in, suggesting other Instagram accounts to follow as well as products and services to purchase.

These updates and the increased number of professional users on Instagram have added to boundary collapse between journalists and influencers. Research suggests that while influencers on Instagram may not immediately identify as a type of journalist, when asked directly to consider this connection, a larger majority view their work resembling or adding to journalism. Notably, the similarities between journalists and influencers may lead to confusion among news consumers and increase the likelihood of the spread of misinformation. Furthermore, the increased focus on ephemeral content has led to a battle for user attention and presents a challenge for news organizations to maintain a constant authoritative presence on Instagram.

Updates to Instagram

Since 2015, Instagram has released new updates beyond the traditional uses of the app, including Instagram stories, released in 2016. Ahead of the stories launch, Instagram released a "Videos You Might Like" option on the explore page, followed by an "Events" option that shared videos and photos of users at nearby live events. Stories were

released shortly thereafter. On Stories, users post ephemeral content available for others to see for 24 hours. On top of the videos and photos, users can now type text in a variety of fonts or draw with various tools. They can add hashtags, locations, and other stickers. News organizations have taken advantage of this feature to share breaking news, to offer commentary on salient events such as sports, politics, and the pandemic that impacted the world in 2020.

In 2017, Instagram released the poll and sticker options on stories, inviting users to take part in brief polls or to ask or answer questions which could be shared publicly or in a private context. The stories function was further expanded with the addition of Instagram Live. Users can go “live” on their accounts through the stories page, and their audience can ask questions or comment underneath the video, which can be responded to in real time. For journalistic purposes, the live function added to breaking news capabilities while giving audiences further engagement opportunities.

When live video first became available, Instagram users could not save or archive those videos. This changed with the advent of Instagram TV (i.e., IGTV) in 2018. The feature allows users to film longer videos than were originally allowed and to, in most cases, archive that content. IGTV was created as a stand-alone app connected to Instagram, but the basic features are available to users on Instagram itself as well.

In mid-2020, Instagram announced it will begin to offer ways of monetizing IGTV videos, as the lack of revenue potential has been seen as a deterrent from leaving other platforms to create videos on Instagram. This followed Instagram’s launch of Reels. Reels was designed to compete with another popular video-sharing app, TikTok, which gained popularity in 2020. Reels differs from IGTV in that Reels is designed to create short-term videos focused on creative clip transitions and set to voice-overs or popular songs. Reels can be public or private, but Instagram encourages users to publish public Reels to grow their presence on the app.

Critiques of Instagram

Instagram has been criticized for its impact on younger users. A 2017 survey of almost 1,500 teens

and young adults conducted by the Royal Society for Public Health in the United Kingdom found that Instagram ranked as the worst app for mental health and well-being. In addition, Instagram is perceived as a pressurized environment that can take a toll on users’ self-esteem, often connected to the number of “likes” users receive and negative comments left by their followers. This resulted in Instagram removing the public display of “likes” in 2019 to create a more welcoming experience and allowing users to restrict the comment feature underneath specific images and videos.

Instagram recently cracked down on its censorship policy, announcing they would remove any content from the explore page deemed inappropriate, regardless of whether or not it violates community guidelines. In addition to banning content depicting sexual intercourse and most types of nudity, Instagram began removing anything sexually suggestive from its explore page. Instagram received criticism for this decision, specifically due to the lack of objectivity in the explanation of inappropriate content. Critics specifically from the arts vocalized their concern, as images deemed violent, shocking, and sexually suggestive, including artistic works and other images that might cause discomfort to the viewer, were removed. Users also saw an increase in the censorship of those posting empowering images of trauma, chronic illness, and mental and physical disabilities.

Instagram continues to work on identifying and banning misinformation. In 2019, Instagram rolled out an algorithm to help combat the spread of fake news by labeling posts debunked by fact checkers as “false information,” but it was not without issue. In 2020, artists called out the app for marking photoshopped digital artwork (i.e., original artwork and content made by artists using digital tools) as false. Instagram took its fake news algorithm a step further in March 2020, announcing it would not allow accounts spreading misinformation to be recommended to other users, remove specific content from the explore page, and downrank content in user feeds and stories deemed false by third-party fact checkers. While already using fact checkers at this time, Instagram was not previously demoting or removing content from user feeds. This move to combat fake news was exacerbated by an influx of misinformation tied to the 2020 coronavirus pandemic.

Instagram executives have stated that they will increase their focus on the recognition and management of misinformation and more updates are expected. However, Instagram's policy changes lag behind other popular social media sites and its ever-changing updates, including features that encourage more ephemeral content on the platform, continue to make monitoring and reporting misinformation difficult.

INTERNATIONAL AND COMPARATIVE JOURNALISM LAW

Freedom of the press (or lack thereof) informs journalism law. This is more or less the case in a rule-of-law democracy. Whether or not it is constitutionally guaranteed in a country, press freedom is recognized as part of freedom of expression under the United Nations' Universal Declaration of Human Rights (UDHR) as a hope and under the United Nations' International Covenant on Civil and Political Rights (ICCPR) as an enforceable human right closer to reality. Therefore, international and comparative journalism law is an important lens through which to examine and understand freedom of the press.

At one time, journalism law was conceptually and theoretically best illustrated via the American media as the Fourth Branch outside the three-branch government, highlighting freedom of expression in general and press freedom in particular as an external value to the self-governing process and as an independent-institution checking value of the government.

But this may no longer be the best way to understand journalism law, given the recent increase in “fake news.” As Lee C. Bollinger, a First Amendment scholar and 19th president of Columbia University, observed, discovery of truth might be more urgent and relevant as a fundamental value of freedom of the press.

By looking to democracies throughout the world, international and comparative journalism law can help one to understand free speech and free press. International law (such as the ICCPR) is global and multinational law (as distinguished from foreign law, which revolves around individual nation-states). Comparative law does not comprise a system or body of journalism laws but rather a method of legal research. The two together act as one unit—international and comparative law—and inform about global law on freedom of the press.

This entry examines international and comparative law, as taught in journalism and communication programs in the United States, within the context of journalism and media law. First, it presents a brief overview of why journalism law has become globalized since the late 20th century. Next, it takes a critical look at the expansion of international and comparative law topics and the reasons for this phenomenon. Finally, it examines what lies ahead in international and comparative journalism law.

Globalization of Journalism Law

In the new world of pervasive global communication systems, according to Bollinger, censorship of news media in one country is no longer limited geographically—and thus has global repercussions. Since the 1980s, international and comparative law in freedom of expression, including freedom of the press, has attracted sustained attention from legal scholars and free-speech law practitioners. U.S. media law's globalization helps American lawyers, and journalists, and journalism academics, to develop, through "reverse perspective," a better understanding of American freedom of speech and the press.

Likewise, students need to learn international and comparative law to understand the meaning and impact of freedom of the press and other individual rights under the U.S. Constitution. David E. McCraw, deputy general counsel for *The New York Times*, has termed "international law" one of the "three i's" that American (media) law students in the 21st century should study, the other two being Internet law and intellectual property.

Expansion of International and Comparative Law

International and comparative law continues to expand as a focus of journalism law. The current era of journalism encompasses citizen journalists, including news bloggers and podcasters, as well as legacy mainstream media journalists ("we're all journalists now"). However, traditional legal issues for journalists, such as defamation, informational access, and source protection, remain challenges to press freedom around the world.

Expansion

These days, an increasing number of American scholars and lawyers teach and publish about international and comparative law on freedom of speech and the press. At Columbia Law School and the University of Oregon, for example, comparative media law is offered as a regular course.

When compared with European scholars and practitioners, Americans' international and comparative law publications are not extensive; however, the collection is rapidly expanding. For example, there are special law review and journal treatments of international and comparative law topics. The access right of the public to the news media was a controversial issue for years in the United States until the 1980s, when the fairness doctrine was abolished by the Federal Communications Act. In 2008, *George Washington Law Review* included an in-depth article on international and comparative law on the right of reply to news stories. In 2020, *Communication Law and Policy*, a refereed scholarly journal of the Association for Education in Journalism and Communication's Law and Policy Division, devoted an entire issue to international and comparative law; the lead article for the journal's special issue was "Freedom of Journalism in International Human Rights Law."

Notably, there is a trend among U.S. journalism scholars and nonacademics to include international and foreign law chapters in books focusing on U.S. law. In fact, nearly all of the major university media law texts, as well as monographs and edited volumes, discuss various aspects of international and comparative law on press freedom. A case in point: For the centennial of the U.S.

Supreme Court's First Amendment cases in 1919 and the 50th anniversary of the Freedom of Information Act (FOIA) of 1966, three chapters in each of *The Free Speech Century* and *Troubling Transparency* address "The International Implications of the First Amendment" and "Comparative Perspectives," respectively.

There are also whole works featuring discussions of international and comparative law. *Privacy Revisited: A Global Perspective on the Right to Be Left Alone* (2016) and *The First Amendment in Cross-Cultural Perspective* (2006), both written by Ronald J. Krotoszynski, are examples of additions to the growing comparative law literature. The free-press-versus-fair-trial debate over the supreme court-press relationship in a dozen countries is informatively covered in *Justices and Journalists: The Global Perspective* (2018). *International Libel and Privacy Handbook* (2020–2021), aimed at journalists and publishers, among others, is a compendium of libel and privacy laws in 33 jurisdictions. As editor Charles J. Glasser, former global media counsel for Bloomberg News, wrote in his preface, *International Libel and Privacy Handbook* was designed to help journalists identify libel and privacy problems before a suit has been initiated.

One of the most significant developments in the *institutional* approach to free speech and press as a global issue in recent years was the creation of Columbia Global Freedom of Expression in 2014 as a visionary brainchild of Bollinger. The initiative seeks to develop an "integrated and progressive" global understanding of freedom of expression and information through case law.

Reasons for Expansion

The Internet is a particular driver of the expansion of international and comparative law. A new set of Internet-driven issues is challenging journalists to reimagine their pre-Internet thinking on how to balance freedom with conflicting societal and individual interests—and nearly all free press law issues arising from the Internet are global because there's no such thing as local online communication.

Consider the "right to be forgotten" (RTBF), which was first read into the European Union General Data Protection Directive of 1995 by the European Court of Justice in *Google Spain v.*

AEPD & Mario Costeja González in 2014. RTBF is now codified by the European Union General Data Protection Regulation (GDPR) of 2016, which has replaced the General Data Protection Directive. The central RTBF issue for journalism is how much individuals can control news collected and processed and archived by the media in the name of "informational privacy."

RTBF is accepted statutorily or judicially in a growing number of countries. It is technically a nonissue in the United States, although the California Consumer Privacy Act of 2018 was inspired by the GDPR. Furthermore, the lack of a specific RTBF law in the United States does not necessarily reflect the reality of RTBF among American news media. Several U.S. newspapers, including the *Boston Globe*, accept RTBF, albeit not exactly the way it was articulated by the European Court of Justice. RTBF in action in the United States showcases the impact of European law on American journalism.

In fact, the impact of RTBF on journalism as a free press is not often critically analyzed in the United States. However, books like George Brock's *The Right to Be Forgotten: Privacy and the Media in the Digital Age* (2016) advise journalists to guard against the misuse of RTBF.

Another driver of the expansion of international and comparative law has been foreign litigation against American journalists. Americans generally did not pay close attention to the international and comparative elements of journalism law until the early 1990s, when the U.S. media started being sued abroad. The strategic "libel tourism" against American journalism in the 1990s–2000s led Congress to pass the Securing the Protection of Our Enduring and Established Constitutional Heritage (SPEECH) Act in 2010 to preempt the enforcement of foreign court judgments that violate the First Amendment to the U.S. Constitution. This U.S. law highlighted how the American right to free speech and press sometimes collide with that of other countries.

Looking Ahead

Since the 1980s, global discourse regarding freedom of the press has become more a dialogue than a monologue dictated by the United States. This

has been accelerated by a decline of the global impact of the U.S. Constitution and by the emergence of the European Convention on Human Rights and the American Convention on Human Rights as new frames of reference for free press as a human right.

This trend will likely continue, as evinced by the increasingly assertive posture of the European Court of Justice in adjudicating free speech and press issues. It will also necessitate a more systematic and sustained attention to an international and comparative understanding of journalism law.

Several issues can likely be addressed through an international and comparative understanding of journalism law. One such issue is freedom of information for journalists and nonjournalists and journalists' privilege, neither of which is a constitutional right in the United States. Another issue is cameras in the courtroom. Televised court proceedings are accepted as part of open justice in England and Canada and other democracies, yet in the United States, especially at the U.S. Supreme Court level, court's public proceedings are not always opened to cameras and other broadcast tools.

INTERNATIONAL HERALD TRIBUNE

The *International Herald Tribune* (IHT) was the name—for nearly half century—of a Paris-based, English language newspaper. The paper had appeared under slightly different names since 1887, when it was founded in Paris as the European edition of the *New York Herald*. Its name changed in 2013 to reflect its ownership by *The New York Times*, and it has been known most recently as *The New York Times International Edition*. As its circulation mushroomed in the latter part of the 20th century, the IHT often styled itself as “the world’s first global newspaper.” This entry discusses the newspaper’s global context, its readership and distribution, competition and economic challenges, and its founding and evolution.

Global Context

Although its recent focus has been on digital distribution, the print edition, at a peak in the early 20th century, was reproduced in 33 cities around the world, with a paid circulation of some 250,000 copies in more than 180 countries. For several decades, the print edition of the IHT was a global presence in large cities and small towns alike, even before the term “globalization” came into general, popular use. No more than 15 percent of its readership was located in any one market, although roughly two thirds of the copy sales were in Europe and the Middle East with much of the remaining distribution throughout Asia.

What also made the newspaper “global,” however, was the fact that it was edited from an international perspective. Its typical reader was thought to be a “citizen of the world,” a business or professional leader with broad international interests who often read the newspaper as a supplement to his or her own local or national press. While both news and advertising content varied to some degree between its Asian and European editions,

the IHT’s principal purpose was to present an international overview that would place the news of any region in a broader, global context. What this often meant, of course, is that a reader needed to turn elsewhere for deeper local coverage.

Readership and Distribution

Many of the readers of the IHT were international travelers or expatriate residents with a strong command of English, the language of globalization. Wherever they were from, many came to regard the paper as their own familiar “letter from home,” as the paper could follow them almost anywhere they lived or traveled. The IHT’s audience was affluent and well educated. Their annual household income toward the end of the 20th century averaged well above US\$150,000, and over 90% of the readers had a university degree.

IHT journalists faced the stimulating challenge of writing and editing for one of the world’s most sophisticated, cosmopolitan audiences. Such an audience also allowed the newspaper to realize a larger-than-normal portion of its revenues from circulation. Most of its copies were sold on newsstands, at a price that was two or three times the level of its local competition. Another key circulation component was bulk sales to airline companies and hotels. The IHT’s demographics also allowed the paper to charge an unusually high price to advertisers, who prized its influential readership.

At the same time, the broadly scattered nature of this audience means that distribution costs were abnormally high. This fact, combined with the often-unpredictable nature of international advertising markets, made it more difficult for the newspaper to achieve dependable profits in its latest years—although it had been a steadily profitable enterprise at other stages in its history. This was particularly true after it expanded its outreach through remote printing sites beginning in the 1970s. Remote site printing improved arrival times for the paper—while also reducing shipping costs.

Competition and Economic Challenges

A growing economic challenge, especially toward the end of the 20th century, was the appearance of alternative sources of quality international news.

Daily competition for print readers came principally from the European and Asian editions of the London-based *Financial Times* and New York-based *Wall Street Journal*. At the same time, local and national newspapers became increasingly able and inclined to present at least some quality news coverage of the global scene. In addition, competition for large multinational advertising campaigns came from weekly and monthly publications that circulated across international borders. *Time* and *Newsweek* magazines were prime American-based examples, and the British-based weekly newspaper *The Economist* became an emerging force in this same period. (Studies showed that the IHT's readership overlapped with that of *The Economist* more than that of any other single publication).

As the years passed, the most important new reality for the IHT (as it was for all print media) was the growing importance of online, digital information sources—which held special appeal for the IHT's sophisticated, and widely dispersed, core readers. In response, the newspaper company focused on developing its own news website as an important method for serving many of its constituents.

Founding and Evolution

The IHT had enjoyed a long history as a pioneer in applying new technologies to gathering and distributing news. The newspaper's founder, James Gordon Bennett, Jr., had been an investor in the 1870s in the first undersea telegraph cable project connecting the United States to Europe. Bennett was then the owner of the fabled *New York Herald*—founded by his father in 1835 and one of the country's first widely circulated newspapers. With such a strong news institution on the one end of the new cable system, Bennett thought it sensible to establish a counterpart newspaper on the other end of the trans-Atlantic connection—both as a way of distributing newly available material to Europe from the Western Hemisphere and as a collecting point for transmitting European news to the United States. The decision was made easier by the fact that Bennett found Europe to be a more tolerant setting for his flamboyant lifestyle and because of his special affection for France, where he had spent a part of his childhood and where he principally resided from the 1870s until his death in 1918.

On October 4, 1887, Bennett launched the *New York Herald's* European edition from a small print shop in the Les Halles district of Paris, and it quickly became known as the *Paris Herald*. At the time, it was one of many small English-language newspapers circulating in the principal cities of continental Europe. But as other such efforts came and went, Bennett's persisted and grew. His enthusiasm for new technologies was one of the reasons. He brought to Europe innovative developments such as the linotype machine, color comic strips, and half-tone photo engravings. His newspaper was among the first to bring information into its newsroom by radio and to distribute print copies by automobile and, later, by airplane.

When World War I forced some Paris newspapers to suspend publication, Bennett, then in his seventies, took personal command of his editorial staff and continued to publish. He died just as the war ended. His company passed, through an intermediate owner, into the hands of New York's Reid family, owners of another publishing giant, the *New York Tribune*. In 1924, the combined newspapers were joined under the title: the *New York Herald Tribune*. But it was only a decade later, when the Reids bought out the *Chicago Tribune's* own storied Paris edition, that the word "Tribune" also made its way onto the nameplate of the now-well-established *Paris Herald*.

The years that immediately followed marked a low point in the newspaper's history. Its New York owners gave it a long leash, and the management in Paris took a quieter attitude toward the rise of European fascism in the 1930s than did their stateside counterparts. This tendency was particularly clear when tourism sections about Germany were being planned—holding on to the advertising revenue they produced was something of a priority at the paper's Paris offices for a time. Nonetheless, a good deal of superb reporting continued to appear in the *Herald Tribune's* pages—and the experience was central in the determination of the Reid family following the war to bring the Paris edition under much tighter control.

The *Paris Herald Tribune* was the last free newspaper in any language to publish in Paris before the Nazi occupation of June 1940. Its final edition famously took up just one side of one page, reporting on the "great flight of the people of Paris," with

the back of that page blank except for a few small advertisements. The newspaper then closed for four dark years. But it reopened late in 1944 with new energy and discipline and the 1950s brought a great surge of success.

Its New York parent, however, fell into difficult straits with the advent of television and the growing success of its chief competitor, *The New York Times*. John Hay Whitney, then U.S. ambassador in London, bought the Herald Tribune Company in 1959 in an expensive effort to save the New York paper, but he finally gave up the project amid the 100-day New York newspaper strike of the mid-1960s.

Having closed down the New York parent, Whitney was determined to save the Paris child. To this end, he formed partnerships first with *The Washington Post* (in 1966) and then *The New York Times* to publish the newspaper jointly. On May 22, 1967, the Paris paper appeared for the first time under a new name, the *IHT*. Whitney Communications later sold the *IHT* to the two other newspapers.

The new nameplate signaled a new era. Under its tripartite ownership, the publication flourished in the 1970s and 1980s, steadily improving its profit, more than doubling its circulation, expanding its advertising sales, and consistently employing to great advantage the extraordinary journalistic resources—domestic and international—of the two leading American newspapers of the era. Their far-flung networks of correspondents and contributors became the *IHT*'s networks as well, while the art of editing—sifting and winnowing, digesting and condensing, and polishing and presenting incoming news—was honed into a distinctive art form by the editorial team in Paris. The paper also slowly assembled a small group of its own reporters, selecting and shaping stories from the perspective of non-U.S. audiences and writing for the *IHT*'s Europe-based deadlines. (This development was sometimes questioned by those who felt that the *Times* and/or the *Post*'s own journalistic resources should not need supplementing.) A number of *IHT* journalists established strong international followings, including Art Buchwald, whose satirical humor column originated at the *IHT* in 1949 and continued for decades, even from its later base at *The Washington Post*, to be the *IHT*'s single most widely read feature. Buchwald was

one of many figures associated with the *IHT* who became a global celebrity. Another was a fictional figure in Jean-Luc Godard's 1960 classic film *Breathless*, a young woman played by Jean Seberg who hawked the paper in the streets of Paris, dressed in a distinctive yellow *Herald Tribune* sweater.

As the decades passed following the 1967 merger, the three-way ownership among competing U.S. companies worked remarkably well, partly because the senior leaders of the owning companies enjoyed compatible personal relationships, and partly because the company had a debt-free balance sheet—and, for a long time, did not represent any drain on the owning companies' financial resources.

Technological innovation was again an *IHT* watchword in the last third of the 20th century. It became an early model of high-tech innovation in Europe when it computerized its editing and typesetting system in 1978. A bit earlier, in 1974, it had pioneered the electronic transmission of facsimile pages across international borders as it opened a remote printing site in London. A similar operation in Zurich followed in 1977. By the time of its worldwide centennial celebrations in 1987, the *IHT* was opening a new print site once every year on average—reaching both old and new markets earlier and at a lower cost.

The most dramatic of these steps came in 1980 as the paper launched a successful new Asian edition, printed in Hong Kong using page images faxed via satellite from Paris. It was the first time that a daily English language newspaper had published simultaneously on two continents—available to readers over breakfast on opposite sides of the world.

The *IHT*'s three-way ownership became a two-way partnership in 1991, as the Whitney interest was sold to *The New York Times* and *The Washington Post*. In the late 1990s, however, as global newspaper economics began to change, so did the owners' patience with divided control. Among other things, it would soon become apparent that two competitive U.S. papers, while they might cooperate in producing a common print newspaper for overseas audiences, might not want to join in producing a common digital, online newspaper that would be readily available both at home and abroad. In 2002, the *Times* purchased the *Post*'s

50% ownership and became the sole proprietor of the IHT. (Some at the *Post* felt that it had been forced out of the partnership by a *Times* threat to start a competing enterprise if the *Post* insisted on remaining a co-owner.)

After a period of intensive study (and anxious uncertainty) in the Paris offices, the *Times* moved to strengthen the paper on several fronts. Among other steps, a more distinctive Asian edition was created, in part through a more autonomous Hong Kong newsroom. The IHT's own corps of independent reporters was expanded, and an expanded business and financial report was launched.

At the heart of the newspaper's continuing popularity, however, were the qualities that had characterized it from birth: an emphasis on credible and relevant information, skillfully reported and edited, attractively and efficiently presented. In an age of information overload, the paper's relative compactness also remained an important asset.

Significantly, when the New York Times Company took over sole ownership of the IHT in 2002, it initially did not change the newspaper's name, cautioned by its market research that the familiar IHT brand name was still a valuable asset among its far-flung audiences. The *Times* did, however, add a new subtitle under the traditional frontpage nameplate, which said: "Global Edition of *The New York Times*." Operations at the Paris headquarters of the newspaper continued on as before. It took another decade before the IHT name was dropped, with the paper becoming the *International New York Times* in October 2013.

By this time, the focus of newspaper publishers across the world was changing to the digital frontier. *The New York Times* plunged into this world more successfully than many other companies, both with its national and its international editions. The international print edition also changed its journalistic focus, with a new emphasis on feature stories. Traditional "breaking-news" stories primarily became the province of electronic distribution techniques, with digital editions appearing on websites and more news accessed via social media platforms.

The evolutionary processes culminated after another 5-year period with the closing of the French editorial operation in 2016. Some staff

members moved to London, and the New York and Hong Kong newsrooms took over the bulk of journalistic management for the now more fully merged U.S. and international editions of *The New York Times*.

It is in that form that the long tradition of globally relevant, trustworthy journalism, which the old IHT had long helped to pioneer, continued to thrive. In a time when the values of independent, objective journalism were increasingly challenged all around the world, these continuing efforts were seen by many to be more important than ever.

INTERNATIONAL JOURNALISM

International journalism refers to the production of news media around the world and reporting about foreign countries. Frequently it denotes

coverage by Western correspondents of countries other than their own. This is of special concern because news travels unevenly across borders. This flow of news is dominated by large corporations and news agencies based in the United States and Europe, even as the Internet offers new opportunities for sharing and disseminating information and global power dynamics have shifted. This entry discusses the evolution of international journalism that has occurred alongside the professionalization of journalism beginning in the 19th century and the changes to the news industry brought on by the introduction of the World Wide Web in the late 20th century. It also looks at challenges to international journalism in the 21st century.

Origins of International Journalism

Journalism around the world developed in conjunction with the formation and spread of national identity, colonialism, modernization, and globalization. The first newspapers appeared in Europe in the 17th century and carried domestic and foreign news. Europeans then took their newspapers to their colonies where later new papers were founded, frequently carrying news about shipping and the home country. The first newspapers in Africa were in French in Mauritius (1773) and English in South Africa (1800), for instance. Vernacular-language newspapers often followed imperial languages. Although the first newspaper in Asia (1822) was in Gujarati, it paid special attention to Europeans and their trade. In all cases, the development of the press contributed to the rise of national identity, the transference of ideas as well as news, and coincided with a process of modernization while linking previously isolated communities.

Professional journalism dates only to the 19th century and the posting of reporters abroad was first associated with war reporting. William Howard Russell of *The Times in London* is often credited as the first war correspondent. His first such assignment was the Crimean War (1853–1856), but he went on to cover conflicts elsewhere. The 20th century saw the spread of foreign posts for journalists in war and peace, but many news organizations cut back on these positions in the 21st century.

Taxonomy

News media operate under varied conceptual frameworks that help explain the character of journalism in different countries. One of the earliest scholarly assessments is found in the influential work of Fred Siebert, Theodore Peterson, and Wilbur Schramm in their 1956 book, *Four Theories of the Press*, which divided the world's news media into four categories: authoritarian, libertarian, social responsibility, and Soviet communist. In the half century since, their model has been criticized, expanded, and updated by others. The need for revision was clear in the face of the collapse of Soviet communism and the rapid advance of globalization. However, their research questions—"Why is the press as it is?" and "Why does it apparently serve different purposes and appear in widely different forms in different countries?"—remain fundamental. The authors' contention that "the press takes on the form and coloration of the social and political structures within which it operates" remains at the heart of international journalism.

In their pioneering formulation, the authors based their approach in the political, social, and historical development of Europe, the United States, and the Soviet Union. Writing at a time dominated by the cold war's bipolar balance of power, they applied their formula globally. Their four theories remain a starting point for discussion of international journalism. Under an authoritarian system, which they conceived of as the oldest and most common, media are controlled from the top and serve the state and ruling elite. The subsequent development of science, capitalism, and enlightenment philosophy ushered in their second theory, the libertarian. This made journalism part of a democratic process in which information was put to the test in a "marketplace of ideas." Readers and journalists were seen as rational citizens who relied on news to participate in political and social decision-making. The authors saw this system functioning most clearly in the United States where it was characterized by a laissez faire approach to media ownership and regulation.

The social responsibility theory arose in the West in response to criticisms that journalism served big business, was controlled by a single

class, was not inclusive, and was often superficial. The development of broadcasting stations made regulation in the public interest necessary due to spectrum limitations. As opposed to a strictly libertarian approach in which only those with economic resources control media, in the social responsibility model, media should strive to include the greatest spectrum of views and sources. Finally, with the Soviet theory of the press, the authors saw a new variant of the authoritarian model, where the tightest control of media was applied to support an ideologically based totalitarian system.

The two root systems—authoritarian and libertarian—remain the basis for much of the discussion of international journalism, which often centers on which media are “free” or “not free.” Press freedom has been an enduring focus of such international media watchdog groups as Freedom House, the Committee to Protect Journalists, the World Press Freedom Committee, and the World Free Press Institute. International press freedom also plays into U.S. foreign policy, which sees free news media as essential to democracy.

Other scholars later developed designs using different categories to describe international news media systems. For example, William Hachten suggests the categories authoritarianism, Western, communist, revolutionary, and development. The first three owe much to the original formulation. The revolutionary concept describes a temporary cause-oriented news media. The development concept sees media as tied to national goals of economic, social, and political development. Hachten notes that friction between developmental and Western policy is crucial to debates about international journalism. Western foreign policy sees the unhindered flow of information as paramount, while developing states often feel that tighter media regulation can help nation-building and economic development.

Even when analysis remains restricted to the West, the conceptualization developed by Siebert, Peterson, and Schramm has been adjusted. For instance, Daniel C. Hallin and Paolo Mancini divide Europe and the United States into pluralist, democratic corporatist, and liberal models. Still, they see stable connections between political and media systems.

Cold War Patterns

Frequently the relationship between media and politics has been addressed at the level of the nation-state. However, following the reach of imperialism, the contests of the cold war, and the rapid development of globalization, attention has also focused on a global news media system.

International news is a staple of developing globalism. Indeed, the earliest American newspapers were filled with items pertaining to shipping and reprints from the London press. A capillary system of news media linked European colonies. These links were strengthened by development of undersea telegraph cables and later radio that extended the speed and reach of older communications. News agencies grew as Britain's Reuters, France's Havas, and Germany's Wolff initially dominated global news flow. Thomson Reuters retains a leading position, and the Associated Press and Agence France-Presse also play central parts. National news agencies became a mark of state legitimacy, a symbol of modernization, and a means to offset the frames presented by global news agencies.

The Soviet Union's TASS became an important distributor of news in its zone of influence and to a lesser degree globally (primarily by restricting the access of outside journalists). Soviet efforts to block news from the West by electronic jamming, among other actions, resulted in state-backed cultural and media thrusts from the West during the cold war. These efforts sought to establish the “free flow” of information and assure that Western interpretations of events and issues would be available to the East. Thus, propaganda and politics helped international broadcasting become an important part of world journalism.

During the cold war, the role of journalism was also an important and contentious subject among the nonaligned states of the so-called Third World. Many governments in developing countries sought greater control over how they received and transmitted news. Western news values that privilege conflict and reporting patterns in which journalists descend on many locales only at times of crisis often led to a diet of news that presented much of the world as threatening and chaotic, a formula typical to this day. Critics charged that this hindered nation-building and development efforts of

many newly independent states. This debate found its greatest platform at the United Nations Educational, Scientific and Cultural Organization's (UNESCO) call for a New World Information and Communication Order and in efforts to promote development journalism as the kind of reporting that responded to the unique realities and needs of developing countries.

Schramm noted in his 1964 book *Mass Media and National Development* that little attention was paid to developing countries in international media. When they were covered, the news could be unflattering or misleading. In 1977, Sean MacBride, former assistant secretary general of the United Nations, was named to direct UNESCO's new International Commission for the Study of Communication Problems. The 16-member commission made its final report in 1980. Their report asserted that the world was divided into media-rich and media-poor countries and that the latter were dependent (to their detriment) on the former. This undermined sovereignty and nation-building efforts. The MacBride report recognized an imbalance of news flow, inherent biases in Western-based international journalism, inequality in the means of media production, technological disparities, and professional difficulties in reporting. Both the United States and Britain took exception to these conclusions as threatening unhindered international news gathering and distribution and both withdrew from UNESCO membership, rejoining the international body only years later. (The United States then quit the organization again in 2019 after charging it with anti-Israeli bias.)

Bringing News Home

Of all the events, trends, ideas, and occurrences in the world, only a fraction get covered in news media. In an early, influential study, Johan Galtung and Mari Ruge presented a set of criteria by which foreign news finds its place and shape in home (in their case Norwegian) media. Much of their rubric for newsworthiness corresponds to what journalism textbooks describe in general (e.g., timeliness, prominence, deviance, impact), but several items were specific to the international events under investigation. For instance, powerful or elite countries get more coverage. Importantly,

if an event abroad is unambiguous and easy to interpret, it is more likely to make its way home. In all, they established a checklist of 12 factors leading to coverage of foreign news and argued that the more boxes a story ticked, the more likely it could appear in the press. Further, the criteria used would then be emphasized and thus the story distorted by its framing.

The Galtung and Ruge model has been critiqued and modified numerous times, with or without strict reference to international newsgathering, but it continues to be an important explanatory device for the discernment of news values. In a broad sense, Pamela Shoemaker and Akiba Cohen have shown that deviance and social significance are the driving forces for what makes news around the globe. As regards the development of international reporting, Galtung and Ruge's observation about ambiguity being problematic for coverage of foreign news may be especially relevant. The end of the Cold War saw not only the dissolution of the bipolar international order but the evaporation of a ready formula by which to interpret events around the globe.

Post-Cold War Changes and Globalization

In the debates of the 1970s and 1980s about news flow and "media imperialism," the Soviet Union sought to diminish Western dominance in international journalism. With the demise of the USSR in 1991, however, rancor about the issue subsided. At the same time, an era of development in media technology and a largely unfettered drive toward global free trade accelerated. Borders and states, it seemed to many, were giving way to globalization. Global integration looked inevitable. Researchers and commentators looked at globalization in terms of economics, politics, and culture and media were part of each. Optimists saw prosperity, peace, and fairness on the horizon. Pessimists saw "McWorld" and Western corporate dominance looming.

By the turn of the 21st century, worries centered on the "digital divide" between rich and poor countries. This concern rested on the observation that while some countries were racing ahead to an era of technologically driven cornucopia of media, including news, others were falling behind. Further, news of the developed North

continued to outweigh that of the developing South and poorer countries still got more news from the developed West than they gave back. Western news media continue to define the developing world as chaotic, if not as cold war dominoes.

Some research suggests that integration with Western media is proceeding, but that media imperialism is diminishing in an era of increased media commercialization. Kai Hafez went so far as to call media globalization a “myth” and showed that news media consumption habits are still local or national in orientation and nation-states are still key determinants in the media ecosystem.

Twenty-First Century Challenges

In 1999, Bhutan became the last country in the world to adopt television. Today, all countries have the Internet although access varies. As the 21st century moves toward its quarter mark, there is continuity and change in international journalism. Most regions of the world are not reported on consistently in media. International journalism largely follows the same news values of what gets covered and how. Conflict and deviance are pre-eminent among these values, thus the news cliché, “If it bleeds, it leads.” Often foreign locations become news sites when there is unrest or discord. Journalists drop into places when conflict flares and depart as the fire dies down, a phenomenon sometimes referred to as parachute journalism. Such visits do not allow reporters to become well educated about the context of a situation. They leave audiences poorly informed and with the impression that chaos and trouble is almost a singular reality around the globe.

Journalists also bring their own preconceptions to their task. Foreign correspondents have traditionally been foreigners in the lands about which they are reporting. While this may give them a certain objective detachment from the issues they cover, it also limits their framework for understanding what they learn. Western foreign correspondents frequently huddle around expatriate communities as well as form their own. They often do not know local languages, especially when in more remote locations. Often, they cultivate relationships with Westernized elites with whom they

feel comfortable and whom they can more easily understand. This insularity may compound cultural biases and narrow the lens through which places and issues may be viewed. The lens is often brought from home and the foreign locale or story is measured against home-based foreign policy positions. Different social and political realities are difficult to comprehend and explain, all the more so under the conditions in which foreign correspondents frequently operate. Consequently, journalists often fall back on stereotypes, simplistic labels (e.g., “tribal areas,” “ethnic cleansing,” “Islamic extremism,” “economic transition”) or simply fail to grasp or convey the complexities of places and events.

Africa is one huge zone of incomprehensibility in which a picture emerges in the Western press of impenetrable confusion and often brutality. Storylines without clear good and bad guys are difficult to deliver. Without the old cold war frame that wrapped much of international news, journalists have frequently experienced difficulties delivering clear explanatory narratives. A foreign correspondent coming into unfamiliar territory must also guard against reliance on local public relations and official sources. Separating truth from spin may be more difficult than at home. It may be easier to manipulate a journalist who is just passing through and has little knowledge of the area.

Audiences are particularly dependent on news media for their understanding of places for which they have few sources of knowledge. Yet journalists and editors are often little more knowledgeable of issues, places, and context than are their audiences. Problems of language acquisition, source development and access, bias, stereotypes, deadline pressure, and financial expense compound the difficulties of foreign correspondence. Television, long the most popular news source for Americans, is problematic for international news coverage because of its dependence on captivating visuals and limited time devoted to each story. The medium is good at creating powerful and emotional imagery but poor at conveying complexities and thoroughly exploring issues and contexts. The Internet, however, is changing the nature of international newsgathering.

Once a top post for any journalist, romanticized and prestigious, foreign correspondence was once considered a plum job. The number of foreign

correspondents has fallen significantly concurrent with the rise of the Internet, however. An irony of the World Wide Web is that while it has enabled news organizations to reach more readers than ever, it has made it harder for many news organizations to make money. Advertising revenue has shifted to Facebook and Google, who do not create news content themselves. Over 20 U.S. news organizations have eliminated all of their overseas bureaus since the late 1990s.

As financial pressures mount, foreign correspondence is changing. Parachute journalism is more frequent and increasingly defended as worthwhile among editors and professionals. Foreign reporters, who already live in-country, are also used. Previously considered biased natives, these journalists bring local knowledge at a cheaper price. More reporting of affairs abroad is also happening from U.S.-based journalists' homes with the aid of computers and the Internet. Citizen journalists and digital-only publications are also contributing to a new era of foreign correspondence.

War reporting, the coverage that made stars out of Ernie Pyle, Martha Gelhorn, Edward R. Murrow, David Halberstam, Christiane Amanpour, and others, is changing too. Today, the detached "noncombatant" position of the foreign correspondent is anything but sacrosanct. Dangers for war correspondents have increased with changes in warfare itself, which is not always between states. War reporting is dangerous, difficult, and vitally important, but it also generates criticism. Critics charge that such singular devotion to conflict in foreign correspondence leaves us only partly informed and with a picture of the rest of the world in a state of barbarism. The Internet, where wide-ranging sources on many topics can be found, has not elevated understanding of the world for most people.

The Internet has upended the news business and facilitated the easy global flow of news and information, but optimism about the harmony, understanding, and equality such technology might bring has been dashed or modified. Nation-states can build digital walls as easily as the internet once leaped borders, and they do in countries that include China, where censorship and information control are sophisticated and strict. The West, which long dominated the infrastructure of international communication from the production of ink

and paper through telegraphy, satellite communication, and fiber optic cable, now faces a challenger in China for the construction of fifth generation mobile technology, or 5G.

Hachten has written of the "triumph of Western journalism" claiming that its conventions have gone global. In form, this is certainly true. The conventions developed in the West, from the over-the-shoulder graphics of television news to website design to news values, are common around the globe. Many journalists share a similar sense of mission as well. However, significant differences still exist in journalism content, the lived experiences of journalists, and in the laws that constrain them. Laws and their enforcement affect press freedom and journalism content. Circumstance can also affect professional practices and ethics. These differences can impact whether a journalist will pay for information, whether he or she will be willing to go "undercover," whether anonymous sources can be used, and whether or how one can be a "watchdog" on government or business. Today, China stands as the biggest economic and political rival to the United States. Its media system serves as a stark reminder of the differences in international journalism that still exist in the era of globalization.

INTERNET: IMPACT ON THE MEDIA

The Internet has had a tremendous impact on the traditional news media and led to convergence—a blurring of boundaries between different mediums so that content can be accessed across them. All types of news media now have a web presence that allows them to extend their reach to a broader

audience and to convey the news in different modalities, including text, audio, and video. Some of the key characteristics of online news media are personalization and interactivity, the reduced importance of geography, and the rise of the 24-hour news cycle. As mobile devices have become commonplace, many news outlets have also developed apps that make it easier for users to access and customize content on smartphones and tablets. This entry discusses the impact the Internet has had on how the news is delivered and on different types of news media, including newspapers, magazines, radio, and television. It also explores the rise of online-only news organizations.

Of the news media, newspapers have seen the biggest change. Starting with establishing a minimal presence on the web—often by uploading a pdf file of the print newspaper—newspapers have embraced the potential of the digital medium and developed interactive websites with multimedia news stories that can be more dynamic and more engaging. By removing major barriers to entry into the news business, the Internet has facilitated the entrance of many new players in the news environment. These digital native news sites have expanded the way news is told and brought attention to issues, topics, and geographical areas not previously covered.

The Internet has had a huge impact on the distribution of news. News aggregators like Google News, Flipboard, and Apple News create a one-stop location for news from multiple sources, while the development of apps has made it possible for news to be accessed on mobile devices. For audiences, the digitization of news has meant more variety of news outlets, more variety in the way news is presented, and more agency in selecting news.

Personalization allows users to select content that meets their interests and shifts the balance of power away from editors and reporters. Web users also can customize delivery of content of interest to them in the form of news feeds and email newsletters and alerts on their mobile phones. Interactive features such as discussion boards allow audiences an opportunity to be part of the conversation and sometimes even shape the content of news sites. In a sense, the Internet has made news media more democratic. But there is also concern that it isolates users by limiting their exposure to

topics and points of view divergent from their own. In addition, some news consumers are no longer exposed to a wide variety of news stories but are limited to seeing those that tie in with their interests. This can lead to less awareness and involvement in local, national, and global issues.

A major influence of the Internet has been to remove geographical limits on the reach of media outlets. No longer are news media restricted to one city or region; the Internet allows them to reach audiences nationwide and internationally—the online version of a local newspaper may find audiences all over the world. This extended reach can also influence changes to news media content; editorial decisions may strive to make the content more appealing to secondary audiences, such as members of diasporic communities. The 24-hour news cycle means that every news outlet is under pressure to update news constantly. This can sometimes lead to inaccurate information being conveyed.

The Internet has led to new platforms for the distribution of news. The development of news apps has made it easier for the news media to reach their audiences and to cultivate audience loyalty and engagement through notifications pushed to their devices. Email newsletters, which can be organized by subject area, are another way of reaching audiences regularly. Social media have become another important platform for distributing news content, while certain social media platforms such as Facebook and Twitter have made it possible for journalists to develop a public profile and comment on events as they occur.

The merger of computer coding with journalism has changed the field dramatically and led to a level of interactivity that had not been seen before. This interactivity takes the form of multimedia narratives, immersive stories where the reader can enter into the world or space being described, and data visualization where information is presented through graphics that readers can engage with and explore based on their interests.

In recent years, traffic to news organizations home pages began to decline with the growing popularity of social media, where about half of Americans receive at least some of their news. Algorithms written by platforms like Google and Facebook determine what news readers might see

in their feed, typically prioritizing certain stories over others and making suggestions based on the audiences' previous choices of news stories.

In response, publishers developed algorithms to curate the news on their apps and websites in an attempt to take back some control over news curation. By developing their own priorities over the way news appears in feeds, they reexert their editorial influence over content and can customize the news experience on their site for different users. *The New York Times'* algorithm, for example, can display the news on its site in over 150 layout combinations that change to display different types of articles and images.

Newspapers

Newspapers began to establish a presence online after Netscape launched its Navigator browser in 1994. By 1997, about half of the daily newspapers in the United States had a web page. Initial newspaper websites were rather rudimentary and served mainly to introduce the newspaper. In many instances, these early sites were not updated more than once in 24 hours. As newspaper readership among those under 30 was declining, operating a website became one way to attract younger users. By the early 21st century, online newspapers had evolved into constantly updated publications that were rich in multimedia content.

Online newspapers vary from one another in their depth of content and degree of interactivity. They also vary in presentation: Some retain the look of the print edition while others have crafted a unique web identity. In most cases, the general concepts of newspaper organization have not changed in the online versions, with special sections devoted to topics such as arts and sports, as well as editorial pages. Even the traditional organization of the printed front page, with the most important stories being presented “above the fold,” is maintained in most website designs; however, some sites take advantage of web technology to present a series of top stories in rotation.

By 2020, having a multimedia web presence was the norm, not only for national newspapers like *The New York Times* but for regional ones as well. Online newspapers use photo galleries, audio, and video clips to present news in more

interesting and creative ways. Data visualization has made it possible to convey complex information with attractive and often interactive graphics. The blending of audio, video, and text allows for multiple levels of reporting as well as for the ability to link to original documents, which can make for greater transparency in reporting. The use of multimedia has helped engage younger readers more comfortable with an audiovisual culture than a purely text-based one.

Having an online presence has enabled newspapers to produce breaking news stories and thus compete effectively with 24-hour cable networks like CNN, Fox, and MSNBC. They are no longer limited by their print cycle and update breaking news stories throughout the day. Many newspapers have shifted to a digital-first strategy rather than giving priority to their print product. Newspapers have increased significantly in their interactivity, allowing readers to provide feedback and express opinions about stories. This interactivity allows readers to participate in a conversation about news and is another factor that increases their appeal to younger audiences.

Newspaper websites can provide greater depth of information than print, with links to original documents, related stories, and background materials. Because there is no online space constraint, newspapers can post stories and features that did not make it into the print version. The ability to search through the newspaper's archives gives online readers an opportunity to trace the development of an ongoing story. Email newsletters are another way of reaching subscribers; many newspapers also have apps that make it easier for their readers to access content on mobile devices.

These changes to the way news is delivered are also evident in the area of lifestyle journalism that includes topics such as travel, food and cooking, home design, and fashion. Photo galleries and videos are now routinely featured on these websites. Some magazines like *Bon Appetit* have been especially successful at extending their brand and their audience through their YouTube channels, while *The New York Times* has been able to successfully charge for its cooking app and generate a separate revenue stream.

In the early years of the Internet, most newspapers generated little if any revenue from their website. They made their content available for free

as a way to attract readers at a time when there was little content online that was restricted. Exceptions to this were *The Wall Street Journal* and the *Financial Times*, both of which were able to maintain a paywall from the outset because of the kind of content they provided. In March 2011, *The New York Times* instituted a paywall at a time when few industry observers believed that this was a good move. But the *Times* proved its naysayers wrong. By summer 2011, the paper had 224,000 digital subscribers and this increase continued with the number of digital subscribers reaching 3.3 million out of a total of 4.3 million print and digital subscribers (this number includes digital subscribers to apps like NYT Cooking and NYT Crossword but not the paper) by December 2018. *The Washington Post* instituted its paywall in 2013 and regional newspapers soon followed.

With an online presence established, newspapers began to explore the potential of social media as a distribution platform. Soon after Facebook launched in 2004, legacy newspapers recognized the potential to reach readers by posting stories on this platform. Twitter, which followed in 2006, became another important way for legacy news outlets to distribute their news stories. Social media platforms continued to grow in importance as a vehicle for distributing news. By 2019, the Pew Research Center found that about half of American adults got their news from Facebook, with YouTube and Twitter following as popular platforms to access news.

At the same time that newspapers were finding new ways to cover news, local newspapers were struggling. The decline in readership that began in the late 1990s led to a decline in advertising revenues as readers' migration online continued into the 21st century. Facebook and Google, which both act as news aggregators and distributors of content, receive the dominant share of local advertising—over 75% according to a Brookings Institution study on the crisis in local journalism.

Since 2004, one in five newspapers has closed and jobs in newsrooms have dropped by 50% according to an ongoing research initiative at the University of North Carolina. These included long standing newspapers like the *Rocky Mountain News*, and *The Seattle Post-Intelligencer*, the latter of which has continued to operate online. Many that did not close reduced their publication

schedule to three to four days a week. Others like the *Christian Science Monitor* stopped publishing their print newspapers and went online. The closing of newspapers has left many communities without a local news outlet and created news deserts where local officials are not held accountable and communities do not receive vital information about local issues.

The financial troubles and closing of many local newspapers led to changes in ownership in the industry with long-standing newspaper ownership groups like Knight Ridder being bought by others. As these ownership shifts were taking place, technology billionaires and investment firms have become owners of newspapers. In 2013, Jeff Bezos bought *The Washington Post* from the Graham family, while John Henry, owner of the Red Sox, bought *The Boston Globe* from *The New York Times*. In 2019, GateHouse Media announced that it had agreed to buy Gannett, retaining the name Gannett and making it the largest newspaper publisher in the United States. The second largest newspaper chain in the United States, McClatchy, declared bankruptcy in early 2020.

Digital Native News Outlets

The Internet has made possible the emergence of a number of new news outlets that are digital natives—that is, they did not exist at all prior to the arrival of the Internet. One of the first entrants in this space was HuffPost, which launched in 2005 as The Huffington Post. It carried blogs and commentary as well as news on a wide variety of topics that included (but were not limited to) politics, technology, sports, the environment, business, and entertainment. BuzzFeed, which was founded in 2006, was known for its listicles (short numbered lists on a variety of subjects) and videos in its early years. In 2011, the company made a significant investment in its news business, hiring journalists from established news organizations as it sought to be taken seriously as a news outlet. BuzzFeed acquired HuffPost in 2020 as part of a deal with Verizon Media, which had owned HuffPost since 2015.

Some digital native outlets created a specific niche for themselves. Politico, which was founded in 2007, focuses on policy and politics, while Vox,

which launched in 2014, focuses on explanatory journalism. ProPublica focuses on long form investigative reporting and distributes its work on its own website as well as through partners like *The New York Times* and NPR. Axios distributes news in the form of newsletters on a variety of subjects and presents its readers with a concise summary, giving them the option of exploring topics of interest to them at greater length. While not digital natives, the Associated Press and Reuters, which, as wire services historically did not reach audiences directly, can now do so through their websites and mobile apps.

Digital native news outlets have also adopted new business models that reduce the reliance on advertising revenue. Almost all of these new outlets are funded by venture capital. In 2020, Vox began soliciting readers for contributions to supplement the capital raised. ProPublica is an exception in that it is a nonprofit organization funded primarily by foundations and which accepts donations from readers.

There are also digital news outlets at the local level that aim to fill the gaps in news coverage for their region. One such news outlet, the San Francisco Public Press, combines a quarterly print newspaper with its digital operations. By choosing to be advertising free, it operates as a nonprofit and is better positioned to cover news stories that major outlets do not cover for fear of losing revenues from important advertisers.

A number of digital news sites have gone beyond local news to hyperlocal news (also called microlocal) which focuses on small geographic areas and topics not covered by the mainstream media. Many use citizen journalists to generate content. These sites are attractive to advertisers and are also able to generate revenues from event postings and classified advertising. One network of hyperlocal sites is Patch, which as of 2019 had over 100 journalists covering more than 1,200 communities across the United States. In most cases, a single Patch journalist covers multiple towns and writes several stories a day.

Digital news outlets have provided opportunities to address the gender imbalance in news with the establishment of nonprofit digital news outlets that focus on topics traditional news outlets have ignored. Both the Fuller Project and The 19th

focus on women, while Prism's focus is on people of color and issues relevant to them.

Magazines

The impact of the Internet on magazines has been similar to its impact on newspapers. On the one hand, magazines have found new ways of storytelling and new ways of reaching their readers through their websites and through apps designed to replicate the magazine reading experience. On the other hand, the Internet has meant more competition for audiences and advertising dollars leading to the closing of many magazines.

A number of weekly news magazines have faced the additional challenge of becoming less relevant when news is now available instantaneously and from a multitude of sources both on computers and on mobile devices. *Time* magazine, the newsweekly founded in 1923, became a household name in the United States and established an international presence. By 2005, the Internet had begun to have an impact on its advertising revenues which led to layoffs. This pattern continued through the 2010s, till its parent company Time Warner sought a buyer for it in the face of declining circulation. Meredith Publishing bought *Time* in 2017, but a year later sold it to technology magnate Marc Benioff. After an 80-year publishing run, *Newsweek* ended its print publication in 2012 and became a digital-only magazine. *U.S. News and World Report*, which was established in 1948, ended its print publication in 2010 and went digital until 2015 when it closed down. One exception to the weekly news-magazine downturn is *The Economist*, which continued to grow through the second decade of the 21st century—a result of content that was more global in focus and a strategy that succeeded in engaging readers across different social media platforms.

While weekly newsmagazines struggled to stay relevant, monthly magazines like *The New Yorker* and *The Atlantic* that covered both politics and culture, fared better. Both magazines use their websites to feature content from their current issues but also produce online-only content, which has helped them stay relevant in an era of instant news. In 2017, *The New Yorker* saw a 12% increase in circulation over the previous year, with

a greater reliance on revenues from readers (65%) than advertising. This was accomplished by a successful digital strategy that placed articles likely to be of interest to potential readers on Facebook and Instagram and in its email newsletters. *The Atlantic Monthly* saw a steady increase in readers and, after the introduction of a paywall in 2019, added 160,000 subscribers. In 2017, Emerson Media (owned by Laurene Powell Jobs, Steve Jobs's widow) bought a majority share in the magazine, which expanded its content to videos.

An important way the Internet has impacted magazines was with the introduction of magazines published exclusively online. Two early entrants were *Salon* and *Slate*, which began in 1995 and 1996, respectively. *Salon* was launched with seed money from Apple, while *Slate* was funded by Microsoft. Each has established a unique identity, offering both political and cultural criticism, commentary, and exposés that have been both lauded and criticized. Both were initially free but introduced paywalls and different layers of content for their readers.

Radio

The Internet has opened up new distribution avenues for radio's content. Internet radio station websites, podcasting, and smart speakers are all ways that radio stations are extending their reach. Most websites offer streaming, which enables audiences to listen to the station's content online in real time. Stations that carry news can update news stories on their websites as they break. Like newspapers and magazines, terrestrial radio stations have seen their audiences and advertising revenues decline. However, advertising revenues for digital radio have been increasing since 2018.

The greatest impact of the Internet has been to remove the limits of geography that radio stations previously faced. Through webcasting, stations can reach listeners across the world. Not only have existing stations adopted webcasting, there are many web-only radio stations, whose content is almost always music. Web radio has made a much wider variety of content available to listeners, particularly for those living in rural areas.

Another important development in radio's relationship to the Internet is podcasting, in which shows can be created, posted to the Internet, and

downloaded for listening later. With podcasting, limits of both geography and time can be overcome. National Public Radio is the leader among radio stations in the United States in providing podcasts of a variety of its programs.

The Internet has made it possible for radio companies to establish a presence and reach audiences directly, rather than through radio stations owned by them. It has also given them the opportunity to extend radio listening beyond the car where most radio listening in the United States takes place. iHeartRadio, the largest owner of radio stations in the United States is also a major podcast producer, just behind NPR in podcast listenership, and has taken advantage of the migration of listeners from radio to smartphones and smart speakers. Its website offers content from all its different stations around the country organized by genre, as well as podcasts produced by a variety of producers from NPR to The New York Times to Fox News. Visitors to the site can create playlists and customized radio stations.

For SiriusXM, the Internet has provided it with an opportunity to reach audiences who do not have a satellite radio receiver or who would like to listen to this content outside their cars. Radio stations have created YouTube channels and apps like Radio.com that let listeners listen anytime, anywhere. Smart speakers such as Alexa and Google Home have become another way to distribute content and reach a younger audience.

Television and Cable News

At the same time that audiences are increasingly relying on online media for news, the importance of television news—both network and local—has been declining. Like radio, television news has found a new distribution platform because of the Internet. The websites of television news networks carry news stories that go beyond those featured in their newscasts, where time is the key constraint, and have a mix of video and print stories. It also allows them to reach a younger demographic, at a time when television news audiences are aging.

Websites have made it possible for the major U.S. television networks to expand their news coverage beyond their daily 30-minute newscasts in

prime time to cover topics in greater depth and to cover a broader range of topics. The 24-hour cable news channels have also established a similar presence on the web. Websites carry a mix of recorded video and written stories as well as live video. ABC News has 24/7 streaming video on its website, and this makes it possible for it to compete with 24-hour cable news channels, such as CNN, Fox, and MSNBC. All these news channels also have apps that make their content easy to access on mobile devices and allow notifications that keep audiences coming back to their content.

Local news stations' websites take a similar approach, using their websites to overcome the constraints of time and to expand their news coverage. Videos of news reports are featured daily, in addition to content that did not make it to the newscast. Websites are organized into the same segments that are used on the newscast—news, sports, and weather. Many local stations also have apps, with additional apps just for weather and sports that make it possible for local news stations to expand their audience.

INTERNSHIPS AND TRAINING PROGRAMS

Journalism internships and training programs continue to be emphasized by educators as a means to acquire further skills, experience, and newsroom acculturation and are regarded as a necessary path to eventual employment in the news industry. In traditional media internships, students perform paid or unpaid work in the newsroom, and

participate in newsgathering in the field, for a pre-determined period of time under the supervision of professional editors. However, as the number of paid journalism internships continues to decline, universities are developing training practicums or media collaboration programs in order to provide opportunities for students. These training programs, frequently structured as coursework, are designed to provide news experience and aim to produce professional-level, published work under the supervision of university faculty. The journalism produced in these programs may be published on hyperlocal digital sites, focusing on audiences underserved by mass media, or be published by legacy news organizations.

This entry discusses the perceived benefits of journalism internships and training programs and the emphasis placed on this professional training by journalism educators. It also explores the significant reduction in paid journalism internships, as media organizations have struggled financially; how unpaid internships can be barriers to professional entry for students with financial need; and how universities are answering this criticism by providing either college credit or, in some cases, financial support. In recent years, universities have increasingly turned to creating their own faculty-supervised training practicums or media collaboration programs to provide this critical training and newsroom experience for students. Critics argue that traditional internships, or university-created newsrooms, sometimes focus too heavily on traditional media structures and disregard the growth of entrepreneurial journalism.

Inception of Journalism Internships

The newsroom historically has been the site of news work, and before the advent of journalism studies in higher education in the 20th century, apprenticeships served to train journalists in the expectations and practices of the profession. As universities began to offer classes and degrees in journalism, aspects of training moved into the classroom. However, educators and newsroom editors still found value in learning by doing. In 1958, the Dow Jones Newspaper Fund was established to provide students with newsroom training, in order to strengthen journalism education and improve the quality of graduates entering the

field. Still in operation, the Fund provides 10-week paid internships to students from dozens of universities. In turn, other news organizations established their own internship or correspondent programs, often awarded on a competitive basis, to students and recent graduates.

Newsroom internships provide acculturation to journalism practices. Interns observe and learn and are ideally provided with mentorship and guidance from experienced journalists and editors. Interns gain experience by performing basic or routine newsgathering functions and having their work published or broadcast. Student interns are able to put into real-world practice the journalism concepts taught in classrooms and work to build their professional portfolios, which they later use in pursuit of jobs. Research has indicated that completing journalism internships has been associated with speedy postgraduation employment and higher starting salaries. In higher education, journalism programs routinely encourage students to intern in the field. Demographic data collected by the Annual Survey of Journalism and Mass Communication Graduates, conducted by the University of Georgia, routinely indicate that more than three quarters of journalism students graduate with a completed media internship. In addition, some university journalism programs require students to complete internships.

Paid Versus Unpaid Internships

As newsrooms and news organization budgets have shrunk significantly since the early 2000s, so has the number of paying journalism internships. With journalism students still seeking internships—for experience or as a mandatory part of the curriculum—and with these workers still providing useful basic functions in newsroom operations, many news organizations began offering unpaid internships. In 2010, the U.S. Department of Labor made clear that to avoid conflict with minimum wage laws, unpaid internships must be extensions of students' educational experiences—with university oversight and credit. After some high-profile class action suits (including those targeting media companies Hearst Corp. and Fox Searchlight Pictures) and court decisions largely favoring businesses, in 2018, the Department of

Labor loosened rules governing unpaid internships.

Instead of pay, many journalism organizations today require students to earn academic credit. In higher education, internships for credit require faculty supervisory resources, connections, and grading. Data from the 2015 Survey of Journalism and Mass Communication Enrollments indicated that among the college and university programs that offer internship credit opportunities, a majority required internship credit, at least for some programs of study.

At institutions with fixed-rate tuition in the fall and spring semesters, students performing internships for credit perform the work in addition to their academic work. However, students who pay per-credit tuition rates, or seek a summer internship, essentially pay tuition for the privilege of gaining unpaid journalism experience. In addition, the proliferation of unpaid journalism internships has raised significant concerns regarding the inequalities perpetuated by freezing out students who cannot afford to take unpaid internships.

Critics hold that unpaid internships are a barrier to entering the profession that dramatically affects aspiring journalists with middle- and lower-class backgrounds, many of whom are required to hold paying jobs as part of financial aid packages. It also lowers the likelihood that people of color, already underrepresented in newsrooms, can access entry-level positions. Unpaid internships become populated by only those who can afford it, and this exacerbates inequalities based in class, race, and gender.

Because internship experience is often ultimately tied to successful postgraduation employment, economically advantaged students are better positioned to enter the profession. To meet this challenge, some schools have begun to assist students with financial need: Graduate students at the Craig Newmark School of Journalism at the City University of New York are guaranteed a summer stipend to support unpaid internships, if students are unable to secure paid work. At the University of Notre Dame, the Gallivan Journalism Program financially supports summer internships at news organizations. At Stanford University, the Rebele Journalism Internship Program provides competitively awarded funding for

internships at approved news organizations. However, university programs such as these, which provide financial support for unpaid internships, remain uncommon.

The Exponential Growth of University-Run Training Programs

University journalism education has long engaged in hands-on training programs to prepare future journalists. The University of Missouri School of Journalism launched one of the earliest examples in 1908, *The Columbia Missourian*, a daily newspaper (and now also a multimedia website), where news content is produced by students and managed by faculty editors. Throughout the 20th century, schools of journalism also began collaborating with traditional media partners and providing news content. At Northwestern University's Medill School of Journalism, since the 1960s, faculty have supervised graduate student journalists. Columbia Journalism School launched a similar graduate student news service in the 1970s. In 1990, the University of Maryland launched its wire-like Capital News Service, with faculty-led, student-staffed news bureaus providing news content to local, legacy media.

During the first two decades of the 20th century, at the same time as paying internship opportunities shrank and a number of media organizations shuttered, university-run practicums and training programs proliferated. Additional universities launched student-produced journalism initiatives, including the University of Alabama, the Cronkite School of Journalism and Mass Communication at Arizona State University, Northeastern University, Florida International University, and Temple University. Many of these university programs focus on community news or areas and topics underserved by existing media organizations. In 2009, a report issued by the Knight Commission on the Information Needs of Communities in a Democracy called on higher education to increase capacity to serve "as hubs of journalistic activity and other information-sharing for local communities" (p. xvi). Educators began to embrace ideas of not only serving journalism students but also to inform communities and become sites of experimentation and innovation in a rapidly changing, disrupted media environment.

While most university training programs are run autonomously by schools for their students, in 2005, the nonprofit Carnegie-Knight News21 multimedia reporting initiative was established to bring together about two dozen students from a variety of universities to work on annual, in-depth summer investigations. The John S. and James L. Knight Foundation provides core financing, but participating schools pay for their admitted students' summer stipends and travel expenses. Past projects have been published by major media organizations and won notable journalism awards.

In 2012, a collection of six foundations that provide significant financial support for journalism education issued a letter explicitly stating that future journalism education funding would be tied to the promotion of experientially based learning, using the term "teaching hospital model." This term is drawn from schools of medicine that use students and residents, alongside licensed doctors, to treat patients and complete physicians' training. In the field of journalism education, while the term is inconsistently defined and applied, the "teaching hospital model" generally incorporates aspects of faculty leading students through experiential newsgathering, alongside print or digital publishing and broadcasting of student content. Proponents of this model of university-led immersive student journalism cite benefit to both students and audiences, particularly in light of media organization cuts and closures.

Advocates of immersive journalism training programs or smaller scale clinics believe it synthesizes skills taught in the classroom. Educators who engage in aspects of experientially based journalism programs value the ability to coach their students as they perform news work, including covering beats, finding stories, and interviewing subjects outside of the university community, practicing ethical newsgathering, producing widely distributed work, and encountering feedback and critiques from public audiences. Programs and professors report graduates of immersive experiences are well-prepared for the profession and have an advantage in a competitive employment environment.

In practice, the programs range in hours involved and depth of immersion. At some schools, participating in a faculty-led immersive journalism experience is a requirement—at others, it is a journalism

elective. Often, it is part of an undergraduate capstone or taught combining graduate and undergraduate students. While a few schools operate independent publications, broadcast programs, or digital platforms to publish student work, many journalism programs operate in partnership with media clients, who either pay nominal subscription fees for student work or receive it for free.

Critiques of university-run journalism training programs focus on the model's hyperprofessional focus, structure around traditional newsroom operations and existing news networks, and links to legacy media, which might benefit financially from free or reduced-cost content or forgo covering beats or hiring additional reporters because of access to student-produced news content. Educators, meanwhile, have expressed concerns about the financial sustainability of these models, as well as the difficulties involved in teaching and producing content, while at the same time attempting to innovate.

Another criticism of the emphasis on university-run journalism training programs is that the model lacks emphasis on the growing importance of entrepreneurial journalism, which operates outside traditional newsroom structures. Today, as the number of full-time newsroom jobs dwindles, organizations are increasingly delegating work to freelancers and stringers. Some educators and scholars of journalism education believe universities should incorporate aspects of entrepreneurialism, including self-marketing and audience analysis, in order to best prepare students for the expansion of gig-work in the field of journalism.

Replicating traditional newsroom structures in university training programs may not best prepare students for the range of opportunities available after graduation. In response, journalism programs are now extending the curriculum into this realm. For example, the Tow-Knight Center for Entrepreneurial Journalism at the City University of New York's Craig Newmark Graduate School of Journalism, launched in 2010 with multimillion-dollar funding from the Knight Foundation and Tow Foundation, helps journalism entrepreneurs launch new journalism tools, startups, and media ventures, with fundamental business courses and venture-building skills embedded in the curriculum. It also offers "Entrepreneurial Journalism Bootcamp" training as part of its graduate program.

The University of Missouri offers an undergraduate journalism degree, with an optional interest area of entrepreneurialism, including study of brand building, marketing content, and mobile app development. The New Media Innovation and Entrepreneurship Lab, at Arizona State University, offers both graduate and undergraduate training, including development of storytelling platforms and news games with media collaborators. This program, like the one at the Newmark Graduate School of Journalism, also allows students to develop their own ideas and ventures, with prototype presentations to local entrepreneurs and investors.

In addition to the specialized training efforts at large educational institutions, research indicates that journalism schools are increasingly offering specific courses in entrepreneurship and audience analysis, and journalism professors are embracing the need to cultivate entrepreneurial mindsets and emphasize building personal branding as part of the training they offer. Increasingly, journalism programs in the academy value training experiences or mentorships with tech start-ups, in addition to or in conjunction with traditional media organization internships that have historically dominated the field as a necessary step toward employment.

INTERPRETIVE JOURNALISM

Interpretive journalism refers to a form of journalism that presupposes and includes some degree of interpretation by the journalist in the news coverage, opposed to the straightforward descriptions of facts that characterize descriptive journalism. Interpretive journalism implies that the dominant voice in the news report is the journalist, not the information source. It is a style of reporting centered on the journalist to the detriment of sources, which empowers journalists, by giving them more control over content, through the selection of themes and the possibility of adding new meaning to facts.

Interpretive journalism thus goes beyond source-driven, fact-focused, and descriptive journalism. At the story-level, rather than simply providing descriptions of what happened, interpretive journalism entails the inclusion of journalistic interpretation and analysis in the news through explanations, evaluations, contextualizations, commentaries, or speculations by the journalist. Interpretive journalism implies both a new way of looking at something and the production of new information (based on interpretation) about it.

Instead of simply describing “what” happened in the news report, in interpretive journalism, the journalist takes the role of an analyst and explains the “how” and the “why” behind facts and events, as well as its consequences, that is, the journalist interprets, contextualizes, and provides explanations, assessments, speculations, and/or commentaries in the news coverage. Interpretive journalism is not based on straightforward descriptions and observation-focused reports of bare facts, it focuses instead on the reasons and motivations behind facts and events and its already known or potential consequences. This entry examines the interpretative nature of journalism, how the Internet has complicated interpretative journalism, and related types of journalism.

The Interpretative Nature of Journalism

Journalistic practice in general has occasionally been presented as an interpretive activity, as it involves decisions that always rely on some interpretation of reality by journalists. Such decisions include, for example, those about what is news and how it should be treated, as well as those about what to include and leave out in each news story. Even the gathering of information about facts could be in itself an interpretative task. The seminal work by Curtis D. MacDougall titled precisely *Interpretative Reporting* (1938) presented interpretation as an intrinsic feature of journalism, as journalists are human beings with values and opinions like anyone else. In this sense, all types of human activity are interpretive to some degree. However, interpretive journalism refers to a specific form of journalistic production that does incorporate explicit interpretations by the journalist in the news story.

These can be intended and properly signaled as comment or news analysis signed by a journalist identified as such or the presence of journalistic interpretations intermixed with descriptions in straight news stories without any forewarning. Even though the journalist is the most prominent voice in the news in both cases, the second case could raise ethical issues because it means that the journalist can put forward certain views about the facts, or even an agenda, and thus contribute to influence the public in a certain direction, without any explicit warning that those are in reality the journalist's own interpretations and not just descriptions of the facts. This could be even more controversial in those places where journalistic work is more equated to the simple purveying of straightforward, objective reports of what happened.

The upfront distinction between interpretive journalism and descriptive journalism thus involves consequences both at different levels. When put in practice, this type of journalism potentially impacts on the topics selected to cover and on the tone of the journalistic pieces. The salience attributed to topics will depend not only on the information that is available but also on the journalists' own knowledge about the topic and on their preferences (e.g., political, personal taste, and experience). As to the tone of the news coverage, the presence of journalistic interpretation in the news has been associated with a higher prevalence of negativity and criticism in the news stories. Theoretically, interpretive journalism signals a shift from the objective reporting paradigm.

Although mostly focusing on the journalism produced in the news media outlets based in the United States, several studies have concluded that, since the 1970s, journalism has become increasingly interpretive and less descriptive. These analyses refer, for example, to the interpretive journalism approach as an attempt to explain change and relate events to each other, or to one in which the journalist selects the theme, which is primary in the news coverage, whereas facts are used just as illustrations of these themes. Despite these claims, it is not possible to ascertain the exact measure in which journalism has actually become more interpretive and whether this is a universal trend (both

in different countries and in different types of media), nor indeed the actual claim, as there are not many longitudinal studies supporting the premise, and the meaning and operationalization of interpretive journalism has also varied from study to study.

Nevertheless, while interpretive journalism is rooted in the inception of journalism itself, the idea of objectivity in journalism is not as old and is only part of journalism's history. In fact, at least until the first half of the 20th century, being "objective" was not a goal for most journalists. Objectivity also does not have the same weight in all journalistic cultures: it is believed to be more important in the United States than in Europe, but even in Europe there are acknowledged differences in countries, for example, between French and British journalisms, the first containing traditionally much more journalistic interpretation in the news coverage. Objectivity as a norm in journalism is linked to its professionalization and to a broader movement in science concerned with the elimination of all kinds of subjectivity and with the reproducibility of results in research. It refers to a set of routine journalistic procedures established to ensure that news stories follow specific formal attributes that conceal any personal bias and views by the journalist (e.g., quote sources instead of presenting the journalist's own interpretation).

Interpretive journalism results from the disbelief in value-free facts and interest-free sources. Facts and events, or any social phenomena, do not simply happen: they have causes and effects that, following the interpretive journalism's perspective, should be brought to the public's attention, contextualized and explained. In addition, social and political actors can instrumentalize facts for different reasons, and therefore, it becomes more useful for audiences the inclusion of explanations about the context in which facts have occurred and of interpretations of the relevance and impact of both facts and sources, when compared to the straightforward reports of the facts as they were described by the sources. Similarly, conflicting versions of the same story or different perceptions of the same fact also require contextualization and the observance of established procedures that are meant to ensure balance in the news.

Internet and Complexity

The debate about the merits or demerits of interpretive journalism, namely whether journalists should interpret and explain the complex world and not just report it, is also linked to discussions about the challenges and the future of journalism. In a time when anyone with the technological means can report instantly the occurrence of facts, and reproduce statements or publish photos and videos of events as they are happening, journalism may need to rethink its main purpose in order to remain relevant in today's societies. This is a time in which audiences need more than just a mere reportage of facts and events from journalism.

This position has become more and more widespread as societies are further experiencing the complex array of effects of the Internet, of social media use, and of the increasing prevalence of user-generated content. The downgrading in importance, or the total absence of the traditional gatekeepers selecting the information that is disseminated, means that propaganda and false information can circulate without any barriers, which potentially results in information environments that are particularly intricate and challenging for the general public. Now, more than ever before, it is simple and inexpensive to disseminate all kinds of disinformation, including fake news, hoaxes, conspiracy theories, and so on. These developments in the information that circulates indirectly highlight the pertinence of interpretive journalism.

With the Internet, an increasing number of mainstream journalists have developed their own spaces of interpretive, point-of-view journalism. In addition, there were notable changes in journalistic genres, such as talk shows and new hybrid media formats, that have expanded the boundaries of what is considered news reporting and have further enhanced the weight of the perspective of the journalist.

As research on journalism has been increasingly concerned with understanding how journalistic work and formats have been evolving with the Internet and social media, such developments pave the way to eminent changes in the conceptualization of journalism itself. In fact, in today's ever-changing media environments, when any person can publish or post information, and it has

become more and more difficult to discern between sound and fake information, interpretive journalism may actually stand out as an important comparative advantage for professional journalists. The complexities of such media environments and of the world itself have thus been contributing to enhance the relevance of journalistic interpretation, that is, the need for interpretation in the news report of facts.

Interpretive journalism's main challenges arise from the adequate identification of the presence of journalistic interpretations in the news coverage and from the adoption of procedures designed to ensure full transparency in the journalist's decisions, for example, in the selection of topics or sources to cover. This is not unimportant considering that critics have already expressed concern over the concealed presence of interpretation and opinions in what is often presented as straightforward news. Furthermore, due to their strong reliance or total dependence on sources, some journalists have also been considered to be very close to the elites (or even part of the elites), which means that they are not fulfilling the expected watchdog role that the most established schools of thought see as one of the most important functions of journalism in society.

It is thus not surprising that interpretive journalism has been often the subject of normative evaluations, with some critics considering that it introduces subjectivity and biases in the news that end up discrediting not only journalists and the news outlets for which they work but also journalism in general. Systematic empirical research about the (positive and negative) effects of interpretive journalism on audiences could contribute to elucidate on the different nuances of interpretive journalism and their implications for the health of democracy.

Related Types of Journalism

There is some consensus about the main features of interpretive journalism throughout time and space: it is mainly associated with the function of providing a specific type of background information in the news reports, namely additional meaning through interpretation, evaluations, and the selection of contextual information. For being driven by a disbelief in value-free facts and

consequently by the prominent voice of the journalist that explains the context and interprets the relevance and impact of facts and events, interpretive journalism is often linked to interventionist styles of journalism. Journalistic interventionism emphasizes the active role of the journalist that while gathering information and telling stories is also expressing a viewpoint, advocating causes, and therefore intervening in reality. Whatever are the motivations (e.g., market-focused, partisan, adversarial, public interest) behind this type of approach to journalistic practice, it presupposes and underpins the prominence of the journalist in the news coverage.

In research, the lack of conceptual clarity has resulted in a richness of the approaches that label and study forms of journalism that display rather close similarities with interpretive journalism. There are a number of studies that propose other concepts but examine very similar approaches to journalism (i.e., journalism that is focused on providing analysis and context; that entails the prevalence of judgments and opinions by the journalist in the news report; and that results in specific, direct forms of journalistic intervention in reality). Some of these concepts have triggered more scholarly interest and have been more consequential than others, but they are similar to the concept of interpretive journalism in what relates to the features of journalism that they have chosen to emphasize, namely the central role of the journalist in the construction of meaning and of journalistic interpretation in the production of narratives about current events.

Such related concepts include long journalism, explanatory journalism, contextual journalism, or new journalism. In addition to these, narrative journalism, ethnographic journalism, or solutions journalism also bear some noteworthy similarities with interpretive journalism. The “long journalism” theory proposes that the emphasis in reporting has moved from event-centered coverage to interpretive news analysis and that the tone of news reports has become more negative because of that. “New journalism” recognizes the fundamental interpretive responsibilities of journalists that are also the primary source of the story. Similar to “contextual journalism,” in which the main purpose is to advance analysis and context to facts, “explanatory journalism,” although it is

clearly based on event-centered reporting, also intends to provide additional meaning to facts and events by placing them in context (e.g., historical, cultural, sociological, economic, political, psychological, or other relevant background). The most recent forms of “narrative journalism” emerged as a response to the news supplied by sources other than professional journalists (including automated news aggregators), and to reengage audiences, it proposes a shift to thorough journalistic investigation coupled with detailed accounts of events and facts that resort to fiction writing techniques. The case of “ethnographic journalism” is slightly different, as it is admittedly an interpretive approach to facts; rather than factual accuracy, what drives the journalist here is the search for the enclosed meaning. Finally, in its explicit focus on the solutions to problems, “solutions journalism” implies the inclusion of interpretation and explanation in its accounts of whether, how, and why different answers to problems work or not.

Given that all of these different concepts deal with the inclusion of meaningful context in the news coverage, with the key purpose of uncovering the underlying meaning of facts and events, as well as with the predominant role of the journalist, whose perspective stands out in the news report, instead of simply providing straightforward accounts of what happened, interpretive journalism can be treated as an umbrella concept. It encompasses a wide range of forms of journalistic expression, in which explicit interpretation by the journalist is always seen as a central feature.

INTERVIEWING

Solid interviewing skills are a staple of every good journalist's toolbox. The same skills that distinguish elite journalists from just-OK information deliverers also spawned an industry of entertainment during the 20th century, as news talk show hosts, late night talk show hosts, and morning and afternoon entertainment shows became eponymous because they delivered some of the most iconic interviews of the 20th and 21st centuries. In addition to informing and entertaining audiences, interviewers with an eye toward recording history have applied the interviewing skills to oral histories, capturing the voices and images of people who might otherwise have been lost in the historical milieu. As discussed in this entry, interviewing requires training, an understanding of how to approach different topics and interviewees, knowledge of the legal precedents for interviews (particularly when recording interviews), and fact checking. This entry concludes with a discussion of some of the most watched interviews of the 20th and 21st centuries.

Training for Interviewing

There are multiple types of journalism-style interviews, including the following:

- Personality profiles
- Casual interviews

- Hard news interviews
- On-the-spot interviews
- Investigative interviews
- Telephone, email, or other remote types of interviews
- Oral histories

Each of these interview styles requires different preparation and may necessitate different approaches. For example, an oral history interview may require the interviewer to carry on a conversation with the interviewee with no particular information gathering goal in mind other than to gain a life story, while a hard news interview may take 10–20 minutes with the interviewer asking the interviewee for specific information and facts. For all of these interviews, however, there is a basic skill set that journalistic interviewers need to master. Those skills include the following:

- Research and preparation, including learning the background of the source and topic
- Listening actively and responding and encouraging the interviewee appropriately
- Asking appropriate open-ended questions and following up on topics with further questions
- The ability to establish a relationship with the interviewee
- Knowing the pitfalls of allowing a source to go “off the record” and how to respond if a source requests to be anonymous or off the record
- Fact-checking information after the interview to double-check that sources provided correct and verifiable information.

Many of the foundations of good interviewing have not changed as technology has changed. For example, ethical journalists are expected to state their affiliation with a news organization and the purposes of the interview for the interviewee when requesting an interview. The purposes of the interview are often restated at the beginning of the interview just to make sure that the interviewer and the interviewee have a basis for anticipating what questions and topics may be covered during the interview. However, most journalism interviewers do not provide interviewees with a set of questions prior to the interview for many reasons, including that interviews evolve based on how interviewees respond to questions and topics.

Interviewers generally have a basic set of topics they want to cover or a few questions they want to start with, and when covering hard topics, they may also have a list of soft topics to intermix with the tougher topics and questions to keep the interviewee engaged and challenged.

Even if an interviewer has a basic set of questions, though, they need to anticipate that the interviewee may bring up off-script topics. Traditional journalism advice encourages beginning reporters to get into the habit of asking their sources “do you have anything you’d like to add?” because journalists may find their sources bring up ideas they hadn’t previously considered. By doing basic research prior to the interview, a reporter can anticipate off-script topics and then decide whether or not they are pertinent to the main issues. Research also provides the interviewer with means to double-check information and follow up on questions in an informed way during the interview.

The best interviewers are able to create a relationship with their interviewees, whether a brief on-the-spot question-and-answer interview or a multiday oral history interview. This means interviewers treat all of their interviewees with respect, regardless of age or perceived ability. Building a relationship based on mutual respect means that journalists need to assume that interviewees can understand and respond to questions. For example, interviewing people with disabilities can be difficult if a journalist is not sure how to approach people with physical or neurological differences. However, when interviewing a person with a disability, speaking directly to the person rather than to their caregiver shows respect that can lead the person with a disability to trust the journalist more than they would someone who does not speak to them directly.

Some of the skills necessary for good interviews are changing as technology develops to help reporters do their job better. For example, advanced recording technology, like all technological advances, comes with positives and negatives. New recording technology can help reporters to double-check quotes and, potentially, to concentrate more on the interviewee and what they’re saying. In some cases, recorders can even produce a transcript of an interview so that a reporter has both a recording and a print-out of the conversation.

However, recording devices fail occasionally, leaving a reporter without an interview or quotes. Many reporting programs and active journalists recommend bringing along a notepad and a pen to take notes even if an interview is being recorded for various reasons, including being able to recover the most important quotes and to navigate the recording and its transcript later so as to find the pertinent part of the recording on deadline. In addition, with recorded interviews, journalists can confirm quotes and to keep interviewees from changing information once it is on the record. Some reporters may play a quote back to a source and ask if they have anything to add, but the recording keeps both the journalist and the source honest to the original statement.

Remote interviews—such as those conducted via video conferencing, email, phone, or even text messaging—can be easy to conduct because they do not require the interviewer and interviewee to be in the same room. However, truly asynchronous interviews—email and text messaging—do not allow as much time or space for the interviewer to follow up on a statement made by the interviewee. While the written format allows interviewers to ensure they are quoting a source correctly, it generally is recommended only as a last-resort interview style because it does not allow for the relationship that creates a spontaneous, interesting interview-based story.

Finally, journalism training counsels that interviewers start by gathering the interviewee’s basic information, including name (and spelling), official title, and perceived relationship to the story subject, all of which may be more difficult than it seems, particularly on deadline. Even video stories, though, have text introducing interviewees by their name and title. Getting that basic information wrong is not only embarrassing or aggravating for the interviewee; it could result in the wrong person being credited with the interview. Essentially, good interviewing comes down to preparation, respect, and a willingness to challenge ideas that seem controversial or inaccurate.

Ethical Considerations

As the Society of Professional Journalists Code of Ethics notes, the journalists’ first priority should be to “seek truth and report it.” One of the biggest

challenges to both seeking truth and reporting it is when a source asks for anonymity or to go off the record. A MasterClass discussion on interviewing sensitive sources with investigative reporter Bob Woodward, part of the duo who broke the Watergate story for *The Washington Post*, notes that interviewers need to identify their sources “whenever possible” and candidly tell sources how information will be used (MasterClass, 2019, para. 5-6).

Reporters should always consider source motivation when a person asks to go off the record. Ethically, “off the record” means an interviewer is not allowed to use any of the information given unless the source specifically says that information is back on the record. Once a source says that information is off the record, the interviewer cannot use the information unless they can find another source to tell them the same information on the record. If a source asks to go off the record, the interviewer asks the interviewee for reasons why the information needs to be given off the record and tells them the legal ramifications of telling information off the record. The Online News Association’s ethics discussion of interviewing includes four categories that journalists should clarify with sources who wish to go off the record:

On the record, which is information that cites the source by name with no caveats;

Off the record, which, as noted earlier, cannot be used in any form in a story;

Background, whereby a source is willing to have information used only under conditions that they have negotiated, which may include only a summary or outline of their general ideas without their name actually being used; and

Deep background, whereby “the information can be used but without attribution” (Kent, 2020, para. 6).

The issues of accountability and reporting truth with as much clarity and verifiability as possible arise when a source requests to be anonymous. Some stories require that sources remain anonymous, whether for the privacy of the interviewee, as in the case of a sexual assault survivor, or because the interviewee is in a position whereby using their identity could compromise their physical safety and job security. The second was shown clearly in the Watergate stories when Woodward

and his reporting partner Carl Bernstein used the pseudonym “Deep Throat” for their insider source on President Richard Nixon’s administration’s involvement in efforts to spy on the Democratic National Committee. The identity of Deep Throat was revealed 32 years later when *Vanity Fair* published the identity as former FBI Associate Director Mark Felt.

Technology and the Interview

Although technological developments have diversified the ways that reporters can conduct interviews, they have also added complexity to the process of gathering information. Smartphones can be both audio and video recorders. Video recording via both videoconference platforms, which also can transcribe video text for use on a website or as postinterview notes, and digital video recording equipment allows interviewers to capture facial expressions, body language, and physical context that a reporter might miss if they were trying to write notes while conducting the interview.

The practice of recording interviews is controversial among journalism professionals. Hand note-taking purists argue that recording interviews creates lazy interviewers who are not paying 100% attention to the interviewee because they figure the recording will capture everything they need. Recording devotees argue that the audio capture allows them to ensure that they can double-check their notes later and that their reporting is as accurate as possible. Some people also argue that a reporter’s use of a recorder keeps the interviewee’s attention away from the notepad where the journalist is writing notes, on what may or may not be important, which may influence what the interviewee chooses to share. If an interviewee perceives that an interviewer is particularly interested in something that makes the interviewee uncomfortable, that person may choose to stop talking or change topics, derailing a line of questioning that would be productive for the interview.

Recording interviews requires reporters to have some legal and ethical knowledge. While U.S. federal law (18 U.S.C. 2511 (2)(d)) requires only one person to consent to being recorded, individual state statutes may supersede federal law and require

interviewers to gain the consent of all parties before recording an interview. As of 2020, 38 states and the District of Columbia have adopted laws that mirrored the federal recording rules. Other states have two-party or all-party consent laws. The Reporters Committee for Freedom of the Press provides a guide to state laws, breaking down in which states interviewers can face civil and criminal penalties for breaking recording consent laws. According to this guide, all states have laws against hidden cameras, although the federal government does not, and most states and the federal government have additional penalties in place for people who disclose or publish information that was recorded in violation of the state and federal statutes (“Reporter’s Recording Guide,” 2012, p. 3).

Fact-Checking Interviews

Fact-checking the content of an interview has increasingly becoming an important part of the reporting process. Interviews need to be fact-checked for a variety of reasons, including interviewees having faulty memories or recalling only a part or a single perspective on an event, interviewees working off assumptions that they have developed from reading other stories or talking to other people, interviewees being unable to cite a reputable primary source for their information, and interviewees making common errors in their own reporting of their information, such as misnaming a person or a place or giving an incorrect number.

Interviewers should know how to question the source of information that interviewees are claiming as facts, as well as understand their source’s biases. To fact-check, interviewers need to know how to find and use primary sources; newsrooms often have research databases available to their reporters. Other research options available to journalists include Google Scholar, open-source research journals, reference sites and books, and other stakeholders (i.e., those with a vested interest in the information in a story). If the interviewer cannot find a primary source, they can reach out to experts on the subject, although even then, source bias could come into the research. Using secondary sources to confirm interviewee claims is also an option; however, one which is usually a last option as secondary sources can be erroneous themselves.

Memorable Interviews

Memorable interviews have defined many of the touchstones of the past century, showing that interviewing remains important for gathering information and capturing audiences. Many of the most successful journalists reached the top of the field by mastering the art of interviewing. When speaking of top interviewers and the most memorable interviews of the 20th and 21st centuries, however, it would be a mistake to overlook entertainers who have delivered some thought-provoking, memorable, and watched interviews. A chart of the most-watched television interviews in U.S. history lists entertainment mogul and icon Oprah Winfrey interviewing Michael Jackson in 1993 at the top with 90 million viewers (Epstein, N.D.). It was the reclusive Jackson’s first interview in more than 14 years.

Oprah Winfrey is not the only talk show host whose interviews have illuminated the news or brought the famous and infamous into people’s homes. Talk show host Dick Cavett brought the Vietnam War home to the United States by interviewing veterans of the war. His coverage of the war and discussions with veterans were so renowned that when PBS produced four Vietnam War documentaries in 2015, one of them, “Dick Cavett’s Vietnam,” was dedicated to his talk show coverage.

Edward R. Murrow pioneered the celebrity interview that dominates much of today’s late night television on his talk show *Person to Person*, which he chaired from 1953 to 1959. On *Person to Person*, Murrow interviewed celebrities ranging from Marilyn Monroe to John Steinbeck to Bing Crosby to politicians John F. Kennedy (a Senator at the time), Fidel Castro, and Harry Truman from his studio chair while they were in their own homes. The laid-back, impromptu style of interviewing featured on Murrow’s *Person to Person* has come to define both news and entertainment interview-based shows. Even the leading satirists and pop culture commentators of the 20th and 21st centuries—including *The Tonight Show*’s Johnny Carson and *The Daily Show*’s Jon Stewart—have employed this conversational style when interviewing people on their shows.

While Oprah and Michael Jackson top the list of the most-watched interviews of the last 100

years, the next three interviews on the top-10 list speak to America's interest in the private lives and scandals of public people. Those three are broadcast journalist Barbara Walters interviewing Monica Lewinsky, the intern with whom then-President Bill Clinton had an affair (74 million viewers), British journalist David Frost interviewing Richard Nixon over the course of four radio and television programs in 1977, 3 years after Nixon resigned the presidency rather than face impeachment (45 million viewers), and longtime-60 Minutes correspondent Steve Kroft's 1992 interview with Bill and Hillary Clinton (40 million viewers) (Epstein, N.D.).

While today social media posts frequently dominate public attention, a thought-provoking, insightful, shocking, or entertaining interview still has the power to draw audiences and command headlines. A skillful interviewer can make interviewees and audiences feel emotions ranging from amusement to outrage with the use of careful research, listening, and prompting interviewees to continue developing ideas that can drive political and pop culture talking points.

INVERTED PYRAMID

The *inverted pyramid* is a model used by journalists and journalism educators to represent the structure of a news story that begins with a statement of the most essential, newsworthy facts and continues with related information in diminishing order of newsworthiness. Though a pyramid by definition is a three-dimensional figure, the inverted pyramid structure in journalism is illustrated as a triangle balanced on one point. The shape signifies the unfolding content of a story, from its wide top to the narrow bottom. This entry explores the function, structure, and history of the inverted pyramid structure from its emergence in the 19th century through its use by journalists and strategic communicators in the digital age.

Function and Structure

The inverted pyramid model is not only descriptive in terms of story structure but also functional in terms of the writing and consumption of news.

For writers, the model can systematically guide the writing process by providing a logical, efficient, and highly consistent framework and is thus a popular choice for journalism and strategic writing educators, particularly in early coursework. Students are taught to approach a newswriting task by first identifying and perhaps ranking newsworthy facts, then seeking supporting information, and finally using the inverted pyramid model as a structural template or starting point. Instruction in the inverted pyramid style generally precedes instruction in other journalistic writing methods.

The structure also presents functional implications for consumers of journalistic content, whether delivered by print, broadcast, or web. When encountering a story in the inverted pyramid style, readers, viewers, and listeners can immediately understand the most basic facts and their importance, as well as the scope of the story, so that they can make an informed decision to read, view, or listen further.

The inverted pyramid is aligned with the idea of journalistic writing that is both orderly and objective by constraining even the most unusual news stories within a predictable structure. The model is composed of three principal components. Presented first, and represented by the widest part of the triangle model, the *lead* (sometimes spelled as *lede*) presents the most central and important facts of the story. The *body*, represented visually by the narrowing sides of the triangle, provides more specific information that clarifies or expands the central facts. Concluding sentences, represented in the model by the triangle's lowest point, may be known as the *tail* of the story, providing background or contextual information.

Lead

Coming at the beginning of the story in one or sometimes two sentences, the lead contains the most important or essential newsworthy elements. The lead typically appears in its own paragraph. Most stories written in the inverted pyramid style begin with a *summary lead*, which comprehensively but concisely answers the basic newswriting questions of who, what, where, and when, and perhaps why and how, in a single declarative sentence. Clear, focused, and formal, a summary lead

can be used for any type of news, but is the most common choice for hard-news stories in the inverted pyramid form. A story about an automotive recall, for example, could begin with a lead that identifies the company (who), the defective part (what), the reason for the recall (why), and the date of the recall (when).

The elements presented in the lead depend on the writer's assessment of which components of the story are most newsworthy—that is, which facts are most timely, proximal, unusual, significant, or new, or which represent conflict or human interest. This determination may also consider the story's intended readers, viewers, or listeners, since newsworthiness is relative and may shift depending on the readers' geographic location, characteristics, or attitudes, values, and beliefs. In a story about an automotive recall, for example, the lead might include additional newsworthy elements such as the number of impacted consumers (significance) or the potential risks (unusualness).

A story in the inverted pyramid style can also be introduced with an *informal* or *soft lead*, particularly in the case of a story providing good news or announcing a coming event. The informal lead presents a more creative introduction to the story but still delivers, in one or two sentences, the who, what, where, when, why, and how of the news. Other lead variations include a blind lead, in which an individual is introduced by identification only in the first paragraph, and attributed direct or indirect quoted material. In these scenarios, information omitted from the lead, such as an individual's name or the occasion of a quote, would be included in a subsequent paragraph, constituting a two-paragraph lead, and the body of the story continues in paragraph three.

Body

The body of a story written in the inverted pyramid style contains additional relevant information that develops the basic facts presented in the lead. Like the lead, body content is generally presented in short paragraphs of one or two sentences, but can be few or many paragraphs, depending on the number of available facts to be told. More a report than a narrative, the body is structured so that information is presented in

diminishing order of newsworthiness, rather than in chronological order. Content can include objective description, explanation, definitions, attributed direct or indirect quotation, examples, background information and context, potential implications, and so on. In a story about an automotive recall, for example, the body of the story could provide information such as a description of the defective part or quotes from company executives.

Tail

Unlike academic or feature writing, a story written in the inverted pyramid style does not include a conclusion, *per se*, but instead draws to a close with presentation of the final piece of information. When written by public relations practitioners, web content developers, or other writers, stories in the inverted pyramid style may present additional information, such as an organization's boilerplate or instructions to the reader, in the tail of the story. For example, news about an automotive recall may provide a telephone number or website for consumer claims in the tail of the story.

History

The inverted pyramid emerged as a methodology as a result of changes in technology and journalistic standards. Well into the 19th century, much news took the form of correspondence or narrative, whether written by a reporter or not. However, with the birth of the often-unreliable telegraph in 1844, news could be delivered as wire dispatches, leading to an emphasis on brevity—a clear departure from the literary style that characterized journalistic reporting of the day. Presenting the central facts of a story early carried corollary benefits in the event the transmission was interrupted or the newspaper had limited space.

Historians have demonstrated, however, that the form did not come into widespread use until the last decades of the 19th century. In a 2003 article, Horst Pottker argues that the structure was adopted during the Gilded Age as newspaper editors made a variety of adjustments in editorial

policies related to the communicative efficacy of their newspapers, including headlines, illustrations, and story structure.

In the 20th century, the inverted pyramid structure came to be recognized as a standard for hard news reporting, though other forms, such as feature writing and “new” or literary journalism, were widely practiced. Though most closely associated with print journalism, the style was adopted by journalists writing for radio, television, and emerging digital journalism platforms. The approach is also preferred by many public relations writers, who recognize that press releases conforming to journalistic standards are more likely to be adopted by media gatekeepers. The structure is modified by some public relations practitioners by adding a boilerplate paragraph at the very end to provide general messaging about the source organization.

Because it presents an efficient and predictable information architecture, the form can be a strong choice in an age of web browsing, diminishing attention spans, and scads of multimedia content, when delivering the most important facts as quickly as possible is a chief concern. Thus, the inverted pyramid continues to guide journalists, journalism educators, and strategic communicators in the 21st century.

INVESTIGATIVE JOURNALISM

Investigative journalism is a genre of news involving comprehensive, in-depth reporting on public affairs that exposes wrongdoing or systemic failure in society. Although some journalists have asserted that all reporting, by definition, should be investigative in nature, investigative journalism is distinguished from other kinds of news such as routine daily reporting, feature reporting, or explanatory journalism. Characteristic elements include the extensive use of documentary evidence; the exposure of hidden problems such as fraud, government waste, or misconduct; and the identification—through original journalistic effort—of persons or institutions responsible for those problems. Self-described investigative reporters also have distinctly different attitudes and perceptions than other journalists. Research has revealed that they are more likely to express support for an adversarial role for journalism in society, for instance.

Investigative reports are sometimes based on leaks from unnamed sources or on tactics such as undercover reporting, the use of which has led to occasional controversies or breaches of accepted journalistic ethics. However, investigative reporting is also regarded by many as the highest form of journalism because of its role in holding powerful institutions accountable. Large news organizations commit significant financial resources to pay for staff and other expenses associated with investigative journalism, such as legal costs and charges for obtaining public records and data. Because of the time and resources involved in producing major journalistic investigations, they usually receive prominent placement and extensive promotion.

Although major journalistic investigations represent a small proportion of journalistic output overall, they tend to be disproportionately influential, often leading to important societal impacts such as legal or policy reforms, administrative or civil actions, or criminal prosecutions in a process

sometimes called policy *agenda setting*. One compelling case was the *Indianapolis Star's* investigation beginning in 2016 of sexual abuse of gymnasts by a U.S. Gymnastics doctor, Larry Nassar, and the failure of the organization to follow up on the complaints. Nassar was sentenced to up to 175 years in prison while a number of officials resigned.

Concern for the sustainability of investigative journalism has been a recurring theme of discourse in the journalism profession since at least the 1970s and intensified at the outset of the 21st century as new digital technologies brought about severe damage to traditional news media funding models. But Investigative Reporters and Editors (IRE), a leading organization that promotes investigative journalism, has reported record membership gains in recent years. And the 2010s saw a dramatic expansion in the nonprofit journalism sector, with hundreds of new organizations devoted exclusively to investigative reporting both in the United States and in other countries around the world. The developments led one prominent observer to declare the arrival of “a golden age of global muckraking” (Coronel, 2016).

The term “investigative reporting” didn’t come into common use until the mid-20th century, but exposés have appeared throughout the history of journalism under many other names—crusades, muckraking, accountability reporting, and watchdog journalism—or no name at all. Common to all of the efforts is a motivation to hold officials and institutions in society accountable on behalf of the public.

Evolution of Investigative Journalism in the United States

Contemporary American conceptions of investigative journalism are closely linked to the Watergate affair, which resulted in the resignation of President Richard M. Nixon in 1974. *Washington Post* reporters Bob Woodward and Carl Bernstein led the way in news media coverage of the scandal and helped win the newspaper the Pulitzer public service prize. Woodward and Bernstein went on to publish two books about Watergate, including the best-selling *All the President's Men*, which was made into a popular movie. The resulting fame for the two reporters was credited with causing a surge in enrollment at journalism schools in the

1970s. While media scholars have contested that notion, and many historians have disputed the centrality of the news media's role in Watergate, the lore surrounding it reflects a persistent and compelling origin story for investigative journalism. As a special genre of professional practice, investigative reporting did flourish in the years surrounding Watergate, particularly after the founding of a dedicated professional association, IRE, in 1975. Nevertheless, the focus on the latter decades of the 20th century minimizes significant investigative efforts by journalists in earlier eras.

The Pulitzer Prizes had a category for "local investigative specialized reporting" for almost a decade before Watergate; the first winners in the category, in 1964, were reporters at *The Philadelphia Bulletin* whose exposé of police corruption prompted arrests and reforms in the city's police department. But the exposure of wrongdoing was a familiar practice in American journalism long before those efforts. Exposés have existed since the colonial period, although they have appeared more intermittently in some time frames than others. The idea of the exposé, moreover, did not originate in colonial America, but had mid-17th century precursors in England such as the periodical *Spie*, whose stated goal was "to shew you fair play (viz. nothing but truth) by discovering the usual cheats in the great game of the Kingdome" (Somerville, 1996, p. 65).

Publick Occurrences, Both Forreign and Domestic, is often cited as the first publication in colonial America to feature a journalistic exposé. Prosecuted in London for seditious publications, Benjamin Harris had decamped to Boston where he founded *Publick Occurrences* in 1690. His first—and last—edition included revealing articles about a sex scandal causing turmoil in the French royal family and about allegations of tortured prisoners in the intercolonial conflicts between France and England. As historian James Aucoin has written, the exposés contained many of the characteristics of contemporary investigative journalism: "revelation of public wrong-doing, documentation of evidence, a challenge to established public policy, and an appeal to public opinion for reform" (Aucoin, 2005, p. 20). Unfortunately for Harris, those characteristics also drew the ire of the colonial governor, who shut the newspaper down after that single publication.

The governor's action underscored the realities of press licensure in the colonial era. But as colonial defiance of royal governance simmered in the early decades of the 18th century, some publishers became more willing to challenge authorities despite the certainty of severe consequences. Imprisonment awaited those, like *New-England Courant* publisher James Franklin (Benjamin Franklin's older brother) and *New York Weekly Journal* publisher John Peter Zenger, who printed exposés revealing abuses of power by royal officials. By the eve of the American Revolution, however, colonists had developed what historian Thomas Leonard calls "a passion for exposure (that) was at the center of Boston political life" (Leonard, 1980, p. 32).

Newspapers with opposing allegiances such as *The Boston Gazette and Country Journal* and *The Boston Chronicle* waged a war of words over charges of hidden corruption, both public and private. One issue ripe for exposure involved a 1768 agreement to boycott the importation of products from Britain. The shipping manifests newspapers published were sometimes distorted or manipulated, but they demonstrated a growing emphasis on documentary evidence as a foundation for news.

Although the news environment of the early 19th century was characterized primarily by highly partisan newspapers, the adoption of the evidentiary approach in episodic journalistic exposés continued. It manifest itself particularly in advocacy publications such as abolitionist newspapers and books in the decades leading up to the Civil War. The first edition of *Human Rights* in 1835, for instance, used advertisements for slave sales from Southern newspapers to bring the realities of slavery to light. Such evidence was later compiled into a book by the American Anti-Slavery Society called *American Slavery As It Is: Testimony of a Thousand Witnesses*.

The growth of evidence-based reporting also included innovations such as observation and personal interviews, techniques pioneered by the mass-distributed penny papers that proliferated in the 1830s and beyond. Among the sensational offerings of these newspapers were exposés of prison conditions, poverty, and other social ills. Crusades, as they came to be called, were more prevalent after the Civil War, as improved printing

technology and increased circulations, among other factors, gave rise to a distinct occupational role for reporters in industrial newsrooms. Newspapers responded to Americans' growing concerns about graft, corruption, and social problems associated with urbanization and industrialization.

The wave of crusades in the late 19th century exposed scandal in New York's Tammany Hall political machine, for instance, and fraud and bribery surrounding the Crédit Mobilier railroad company. Among the prominent publishers who promoted the exposé was Joseph Pulitzer, who took his crusading style from the *St. Louis Post-Dispatch* to the *New York World*. The *World* was where Elizabeth Cochrane, writing under the name Nellie Bly, pursued a number of undercover investigations, including her famous account of poor conditions inside the Blackwell's Island asylum, published in 1887.

The final decades of the 19th century and the first years of the 20th constituted what historian Richard Hofstadter called an age of reform, when exposure became "a recurrent theme in American political life" (Hofstadter, 1955, p. 187). In addition to newspaper crusades, magazines and books dealt with corruption and reform. Henry Demarest Lloyd wrote a series of articles detailing corrupt practices and the concentration of wealth by railroad and oil monopolies. First published in *Atlantic Monthly*, they were later turned into his 1894 book, *Wealth Against Commonwealth*.

Lloyd's work and other crusading journalism of the 1880s and 1890s laid a foundation for the muckraking movement of the early 20th century, which centered on writers for national magazines such as *McClure's Magazine*. President Theodore Roosevelt came up with the name "muckrakers," likening the journalists to the man with the muck rake, a character in John Bunyan's 1678 work *Pilgrim's Progress* who is fixated on cleaning the dirty floor. Although the name was intended as a critique, some journalists continue to use it as a term of honor.

Unique in the history of investigative reporting, the muckrakers were closely aligned with a political movement, Progressivism, and they were outspoken in their advocacy of reform in government and business. Muckraking exposés shone a light on exploitation of child labor, public corruption, and a variety of public health threats. Their work

is credited with prompting major government reforms such as the Pure Food and Drug Act, passed by Congress in 1906. One of the first and most famous examples of muckraking was Ida Tarbell's 1902-1904 series in *McClure's* documenting anticompetitive practices by John Rockefeller's Standard Oil Company, which ultimately led to the court-ordered breakup of the company.

Although some historians have characterized the years between the muckrakers and the 1960s as a time of quietude for the press, newspapers and later broadcasters produced exposés with regularity throughout the period, especially but not exclusively at the level of local news. One study of the Pulitzer Prizes between 1917 and 1960 found that the proportion of investigative reports entered each year held steady at between 10% and 20% of submissions over that time span. Further, those entries came from all areas of the country and from a wide variety of newspapers. One of the earliest prizes for reporting was given to Harold Littledale of the *New York Evening Post* in 1918 for an exposé of abuses in New Jersey's state prisons. Other famous examples include the exposure of the swindler Charles Ponzi by the *Boston Post* in 1920 and, the following year, the investigation of the national Ku Klux Klan by the *New York World*.

By mid-century, journalism trade publications were beginning to take notice of the ongoing prevalence of exposés, and the phrase "investigative reporting" started to take hold. Its first mention in *The Quill's* annual award edition, published by the journalism fraternity Sigma Delta Chi (now known as the Society of Professional Journalists), came in 1948.

Media scholars have observed that investigative reporting flourishes particularly during times of public turbulence, and the 1960s offer much evidence for that argument, with journalists exposing civil rights abuses and other social troubles. "Harvest of Shame," a documentary by the CBS television network revealing the exploitation of migrant workers in America, was a leading example of the efforts by broadcasters to embrace the practice of investigative reporting. Among the notable investigations related to the war in Vietnam was Seymour Hersh's shocking revelation in 1969 of the slaughter of civilians by U.S. soldiers in the village of My Lai. Hersh was a freelance reporter whose

work was among the first projects underwritten by a new organization called the *Fund for Investigative Journalism*, one of the first journalism nonprofits oriented exclusively around investigations. Another milestone for investigative reporting came with the formation of the first permanent, full-time investigative team in 1967. *Newsday's* team would soon be emulated in print and broadcast newsrooms throughout the United States.

The 1970s brought the Watergate scandal and the founding of the world's first professional association dedicated to investigative journalism, IRE, formed in 1975. The new organization was galvanized by the 1976 assassination of investigative reporter Don Bolles of the *Arizona Republic*. Bolles was killed in the middle of a corruption investigation and shortly before he was scheduled to speak at IRE's first national conference. Dozens of his colleagues from around the country later converged on Phoenix to complete his work in an effort called the *Arizona Project*.

IRE has grown from a few hundred practitioners to a membership of around 5,000 journalists, students, and educators. Meanwhile, investigative journalism has been prominent in some of the most consequential developments of the 1970s onward, from the Iran-Contra scandal during the administration of U.S. President Ronald Reagan in the 1980s to the Russian interference in the U.S. presidential election in 2016 and the slow response to the COVID-19 pandemic by the administration of U.S. President Donald Trump in 2020.

Contemporary Practice and Controversies

Despite economic challenges to the traditional business model for news in recent years, investigative journalism has maintained a steady presence. Many large news organizations, particularly at the national level, support full-time teams devoted to investigative work, and many smaller newsrooms continue to produce occasional investigative reports. Investigative journalism has also found new pathways for growth outside of traditional newsrooms. In 2007, for instance, journalist Laird Townsend founded a nonprofit organization called *Project Word* to serve freelance journalists from diverse backgrounds; in 2018 it was renamed Freelance Investigative Reporters and Editors. In 2015, four African American journalists founded

the Ida B. Wells Society for Investigative Reporting with a goal of increasing the ranks of journalists of color conducting investigations. The society is named for a fearless Black journalist who investigated lynchings in the 1890s (and who, in 2020, was recognized with a special citation from the Pulitzer Prizes for "outstanding and courageous reporting").

As the commercial news business contracted during the 2010s, nonprofit newsrooms proliferated. The Center for Investigative Reporting, founded in 1977, lays claim to being the first nonprofit investigative newsroom in the United States. In 2009, the center was among 27 investigative news nonprofits that met at the Pocantico conference center in New York and established an umbrella organization called the *Investigative News Network*. The organization encourages collaborative reporting efforts and assists in the establishment of new investigative centers. Now called the *Institute for Nonprofit News*, the network comprises more than 200 nonprofits in North America, though not all of them focus solely on investigations. It is not unusual for these organizations to collaborate with commercial newsrooms on significant investigations.

Further aiding the expansion of investigative reporting in recent years has been the adoption of computer-assisted reporting methods, referred to more broadly today as data journalism. This variety of reporting involves the analysis of databases, often available from public agencies or other institutions but sometimes compiled by journalists themselves, to shed light on government performance or social issues. Since the early 1990s, IRE has been the foremost advocate of advances in data journalism, training journalists in the United States and around the world through its National Institute for Computer-Assisted Reporting. In 2005, IRE created an award to recognize sophisticated use of computer and social science methods named after Philip Meyer, who used survey data at the Knight Ridder newspaper chain in the 1960s and later wrote an influential early text on social science research called *Precision Journalism*.

Whether the methods used are traditional "shoe-leather reporting" or advanced data analysis, the goal of investigative reporting has remained constant: to expose societal problems and spark reform. Studies of media agenda building have

demonstrated how official sources carry enormous influence in shaping issue coverage in the news media, but scholars have also documented a reverse agenda-setting effect in which journalism can prompt policy reforms. Economist James T. Hamilton has calculated the economic impact of investigative reporting, estimating that for every dollar invested by a news organization, there can be hundreds of dollars of societal benefits from the resulting reforms. One case Hamilton highlighted was that of Pat Stith of the *Raleigh News & Observer*, who did hundreds of investigations that led to 31 new laws and numerous firings, indictments, convictions, audits, and policy changes over more than 40 years.

A key mechanism in the process of reform is what David Protess and his colleagues called “pre-publication transactions” between investigative journalists and government officials. These exchanges underscore how deeply investigative journalists are entwined in the policymaking process. In fact, in the early decades of the 20th century, it was not uncommon for reporters to become personally involved in official investigations that grew out of their own stories. Although today’s journalists are generally disinclined to exhibit that level of advocacy, they often push for reaction by public officials, producing numerous follow-ups to their investigations reporting the resulting action—or inaction.

This close engagement in the policy process has sometimes blurred the lines between journalistic and official endeavors, often compounded by the fact that some news organizations label as “investigative reports” news stories that merely disclose details of official investigations. Research has shown that public perceptions of what constitutes investigative reporting sometimes differs from journalists’ views. Survey research has also revealed divergence of opinion on the acceptability of certain practices that are common to investigative reporting, such as deception and the use of unnamed sources.

Occasional controversies and fiascos have resulted from those practices. One famous example took place in 1978, when the *Chicago Sun-Times* opened a bar called the *Mirage* and used hidden cameras to document local officials soliciting bribes from employees, who actually worked for the newspaper. The revelation of such brazen

official corruption would have been an easy pick for a Pulitzer Prize, but jurors were uncomfortable with the ethics of the monumental deception. Two decades after the *Mirage* investigation, ABC’s *Primetime Live* program documented sickening food safety violations at the Food Lion grocery store chain. The method: Hidden cameras worn by producers who obtained employment at Food Lion by falsifying their job applications. Food Lion didn’t challenge the accuracy of the stories but sued ABC for trespass and fraud, and a jury awarded the company millions in damages. The penalty was essentially wiped away on appeal, but the case made clear the public’s distaste for dishonest investigatory tactics. Another major case involved the *Cincinnati Enquirer*’s 1998 exposé of abuses and exploitation by Chiquita Brands at its Latin American plantations. Again, the accuracy of the story was not in question, but the paper ran a front-page apology and fired a reporter who had obtained much of the information for the stories through unauthorized access to Chiquita’s voice mail system.

Other black eyes for investigative reporting have involved overreliance on unnamed sources. In 2017, CNN fired three investigative journalists after retracting and apologizing for a story involving purported Russian ties to Anthony Scaramucci, a close confidante of President Trump. And in 2019, the online news site BuzzFeed was heavily criticized for a story by two top investigative reporters that claimed the president had directed his personal attorney to lie to Congress. The story, based on anonymous federal investigators, was refuted by the head of the investigation, Special Counsel Robert Mueller.

A further serious criticism of investigative journalism is that it sometimes fails to expose major problems, whether by omission or commission. The financial crash of 2008, brought on by reckless practices of major lenders and investment banks, is an instructive case. In his book, *The Watchdog That Didn’t Bark: The Financial Crisis and the Disappearance of Investigative Reporting*, former *Wall Street Journal* reporter Dean Starkman argued that the crash might have been avoided had the business press done its job of holding financial institutions accountable rather than becoming dependent on access to elite inside sources for routine news stories. Other analysts

and media critics have argued that the news media's own entanglement with corporate capitalism ensures that such investigations won't be put before the public. One recent study examined 28 examples of backlash against journalists who produced investigations that challenged government or corporate interests, finding "support for the claim that institutional interests significantly affect media independence in mainstream U.S. news outlets" (Kennis, 2017, p. 1273).

While findings and examples like the foregoing are troubling and provide ammunition for media criticism, there is much counterevidence to suggest a strong news media accountability function against powerful public and private interests. Most news organizations take swift action to remedy faulty investigative reports, but the vast majority of the hundreds of investigations do not require such action. Moreover, the many award-winning investigations into topics including corporate misdeeds, the influence of money in politics, and organized corruption offer compelling testimony to the willingness and ability of investigative journalists to challenge entrenched interests.

Global Expansion and Transnational Collaboration

While investigative reporting has not been limited to the United States, it has been on the rise as a global practice in the 21st century, even making inroads in some countries with authoritarian press systems. Transnational organizations that support accountability reporting include the Global Investigative Journalism Network, founded in 2003, and the International Consortium of Investigative Journalists (ICIJ), founded in 1997. The Global Investigative Journalism Network has staff on five continents and 182 member organizations in 77 countries. ICIJ is a U.S.-based nonprofit that functions as both a global network (comprising journalists in more than 90 countries) and an investigative newsroom. In the latter role, it has organized extensive cross-border investigative collaborations such as the Panama Papers exposé that began in 2016. ICIJ and more than a hundred media partners obtained millions of leaked files from a Panama law firm and used them to document offshore holdings and tax evasion by hundreds of officials around the world.

The investigation has continued, with reported results including criminal investigations in 82 countries.

Noted Investigative Journalists in the United States

This section provides brief sketches of some prominent U.S. investigative journalists not named earlier, with a focus limited to those active in the 20th and 21st centuries.

Jack N. Anderson (1922–2005)

Anderson got his start in journalism by editing the Boy Scout page of the *Deseret News* in Salt Lake City, and his career eventually landed him as a partner of famed "Washington Merry-Go-Round" columnist Drew Pearson. After Pearson died in 1969, Anderson took over the column, which at one point was syndicated to more than 1,000 newspapers. He used the platform to expose major scandals, breaking news of the Iran-Contra affair, for instance, and the CIA's efforts to have Cuban dictator Fidel Castro assassinated by the FBI.

Anderson's uncompromising investigative work made him a target of angry politicians, including President Richard M. Nixon. Nixon's henchman, G. Gordon Liddy, plotted to assassinate the journalist, only to have the scheme foiled by the Watergate burglary arrests. Anderson's journalistic method of choice involved leaked documents—sometimes classified ones—but he was not above snooping in someone's trash or using other less respectable tactics.

Paul Y. Anderson (1893–1938)

As Washington correspondent for the St. Louis Post-Dispatch, Anderson won the Pulitzer Prize for Reporting in 1929 in connection with his running investigation of the Teapot Dome scandal. The scandal involved officials in the administration of President Warren Harding selling discounted oil reserves in Wyoming and led to a congressional investigation and corruption convictions of Interior Secretary Albert Fall and oil baron Harry Sinclair. Called one of the finest journalists in the country by H.L. Mencken, Anderson first gained prominence investigating race riots in East St. Louis. His work also

led to the impeachment of a federal judge in Missouri. In spite of his successes, Anderson struggled with alcoholism that often resulted in missed days of work, and in 1938, he took his own life with an overdose of sleeping pills.

Donald L. Barlett (1936–) and James B. Steele (1943–)

This legendary duo met and began working together at *The Philadelphia Inquirer*, then moved to *Time* magazine in 1997, and finally became contributing editors at *Vanity Fair* in 2006. They were early adopters of computer-assisted reporting techniques, examining political and racial bias in Philadelphia's criminal justice system in the 1970s. They specialized in stories about inequality and taxation, winning their first Pulitzer Prize in 1975 for stories showing the IRS's disproportionate pursuit of lower income taxpayers.

The second Pulitzer awarded to Barlett and Steele, in 1989, recognized "The Great Tax Give-away," which exposed how the tax code favored the wealthy and politically connected. Barlett and Steele are widely admired by journalists for their painstaking and thorough methods. In 2007, the Barlett & Steele Awards for Investigative Business Journalism was established in their honor by the Donald W. Reynolds National Center for Business Journalism.

David Barstow (1963–)

An investigative reporter at *The New York Times* for 30 years, Barstow is the first journalist ever to win four Pulitzer Prizes. In 2019, he was part of the team that earned a Pulitzer for an exposé of Trump's finances and avoidance of taxes. Other investigations probed workplace safety issues and revealed how Walmart paved its expansion in Mexico with bribes. Barstow's final year at the *Times* was marred by controversy over reports in *The Daily Beast* that he attempted to ghostwrite a book about the Trump finance exposé. In 2019, he was named to the Reva and David Logan Distinguished Chair in Investigative Journalism at the University of California, Berkeley Graduate School of Journalism.

Robert W. Greene (1929–2008)

Greene started the country's first permanent investigative reporting unit, at Long Island *Newsday*, where he worked for nearly four decades. He

was also a force in the founding of IRE and a key player in the Arizona Project, which brought together investigative reporters from around the country to finish the work of their assassinated colleague, Don Bolles. Greene's *Newsday* team won two Pulitzer Prizes, one for a property zoning scandal that involved a top editor at his own newspaper. But Greene was unflinching, having honed his investigative instinct working for New York's Anti-Crime Committee. He also spent a year as an investigator for the U.S. Senate's Rackets Committee.

Greene was a colorful figure known to punish the newspaper's expense accounts in the course of his projects. One of them was a 6-month investigation of the heroin scourge in Long Island that tracked the drug to its origins in Turkey. The project reportedly cost more than \$100,000 (more than half a million in 2019 dollars)—but it won Greene's team its second Pulitzer Prize.

Nikole Hannah-Jones (1976–)

Hannah-Jones is known for her in-depth investigations of civil rights issues and racial injustice. Working at the investigative nonprofit ProPublica, she wrote about de facto segregation in housing and education. In 2019, she moved to *The New York Times*, where she anchored the paper's extensive 1619 Project exploring the continuing legacy of slavery on racial inequality in the United States. With three other African American journalists—Corey Johnson, Ron Nixon, and Topher Sanders—Hannah-Jones founded the Ida B. Wells Society for Investigative Reporting, a nonprofit organization that works to encourage journalists from underrepresented backgrounds to do investigative reporting.

Hannah-Jones was a 2017 recipient of the MacArthur Foundation's genius grant. Other awards include the George Foster Peabody Award, the George Polk Award, the Sigma Delta Chi Award for Public Service, and, in 2020, a Pulitzer Prize for commentary. She now has a tenured role at Howard University as the inaugural Knight Chair in Race and Journalism.

Charles Lewis (1953–)

Lewis was an investigative producer at ABC News and *60 Minutes* before striking out on his own and founding the nonprofit Center for Public

Integrity in 1989. Under his leadership, the center produced more than 300 investigative projects, many of them focused on the influence of money in politics. One prominent scoop exposed the practice during the administration of President Bill Clinton of hosting major campaign donors in the White House's Lincoln bedroom.

Lewis also created the ICIJ, originally a project of the center but now an independent nonprofit that encourages and organizes international investigative collaborations. As of 2020, he was the executive editor of the Investigative Reporting Workshop at American University, which produces investigative stories in collaboration with numerous top news organizations.

Jane Mayer (1955–)

Mayer has been a staff writer for *The New Yorker* since 1995 and is known for her investigations of money in politics, particularly the influence of billionaires such as George Soros and the Koch brothers. Her investigation of the latter led to a best-selling 2016 book, *Dark Money: The Hidden History of the Billionaires Behind the Rise of the Radical Right*. In 2011, she documented heavy-handed prosecution of whistleblowers by the administration of President Barack Obama, leading to the dismissal of felony charges in the case of a National Security Agency official. A notable investigation, written in 2018 with Ronan Farrow, revealed reports of abusive treatment of women by New York's attorney general, Eric Schneiderman, who resigned after the article was published. Previously, Mayer worked at *The Wall Street Journal*, where she became the paper's first woman White House correspondent.

Jessica Mitford (1917–1996)

A naturalized U.S. citizen who was born in England, Mitford may be best known for her 1963 book about corrupt practices in the funeral home industry, *The American Way of Death*. *Time* magazine dubbed her “the Queen of the Muckrakers” after her 1969 investigation of a prominent—and fraudulent—correspondence school course for writers, published in *The Atlantic*. Mitford later wrote a book about investigative reporting, *Poison Penmanship: The Gentle Art of Muckraking*, published in 1979.

Clark Mollenhoff (1921–1991)

Mollenhoff spent most of his career as a national investigative reporter for the Cowles newspaper chain. He got his start exposing police corruption at the *Des Moines Register* and later won a 1958 Pulitzer Prize for stories on corruption in the Teamsters union that helped lead to the conviction and imprisonment of Jimmy Hoffa. Mollenhoff was known to actively push for reaction or reform based on his stories, and he was not shy about cooperating with government investigative committees. His 1981 textbook, *Investigative Reporting: From Courthouse to White House*, was one of the first in the field. In a bit of historical irony, Mollenhoff did a short and rocky stint as special counsel in the Nixon administration. At his death, he was a professor of journalism at Washington and Lee University.

Edward R. Murrow (1908–1965)

Murrow pioneered the documentary form for television, paving the way for generations of broadcast investigative journalists. His career began in radio, and he became renowned for his dramatic live reports aired during German bombing raids over London in World War II. After the war, he had a radio program called *Hear It Now*, which became *See It Now* when he switched to the new television medium. His groundbreaking documentaries in the 1950s and 1960s included an exposé of trumped-up charges against Air Force Lt. Milo Radulovich during the McCarthy era. After the broadcast, Radulovich was reinstated, and Murrow went on to produce another damning episode of *See It Now* shedding light on Sen. Joseph McCarthy's extreme tactics. Murrow's name is affixed to one of the broadcast news industry's highest awards.

Sacha Pfeiffer (1971–)

Pfeiffer was part of *The Boston Globe* spotlight team that produced the Pulitzer Prize-winning exposé of sexual abuse by priests—and the Catholic Church's cover-up of the abuse—in 2003. The stunning story became the subject of the 2015 feature film *Spotlight*, with Rachel McAdams portraying Pfeiffer. Pfeiffer also coauthored a book about the church scandal with other *Spotlight*

team members. Although best known for the priest exposé, she has also produced investigations into shoddy home construction, financial abuses by private foundations, and other subjects. Pfeiffer has worked in both radio and newspapers and joined NPR as an investigative reporter in 2018.

Myrta Pulliam (1974–)

Born into a family with a long history of newspaper publishing, Pulliam was part of the *Indianapolis Star* team that investigated bribery and extortion within the Indianapolis Police Department, producing a series that won the Pulitzer Prize for Local Investigative Specialized Reporting in 1975. With one of her colleagues on that project, Harley Bierce, Pulliam came up with the idea of a national network of investigative journalists, and the two of them were among the founders of IRE that year. The new organization held its first national conference in Indianapolis. Pulliam was also a central player on the Arizona Project.

George Seldes (1890–1995)

Seldes began his career as a reporter at the *Pittsburgh Leader* and received a quick first taste of disillusionment in the press. When he turned in a story about a rape complaint involving a department store owner's son, the paper used it to squeeze more advertising from the store rather than publishing it. Seldes would go on to work as a foreign correspondent for the *Chicago Tribune*, but his drive to do investigative reporting led him to write books—on subjects such as American corporations' connections to Nazi Germany—and then to publish a weekly newsletter called *In Fact* beginning in 1940. He covered stories other news organizations wouldn't, such as the connection between tobacco and cancer. At one time, the newsletter had more than 176,000 subscribers. But Seldes went too far when he exposed Senator Joseph McCarthy as a plagiarist and tax cheat. He was falsely accused of being a communist, resulting in losses in subscribers and the end of his newsletter by 1953.

I. F. Stone (1907–1989)

Stone spent the early decades of his career writing for progressive publications such as *The*

Nation and *PM*. But like Seldes, Stone preferred being a gadfly investigator who did it his own way. In 1953, he began publishing his own newsletter, *I. F. Stone's Weekly*, after he was blacklisted from mainstream news outlets because of suspected communist sympathies. Stone was known for dogged reading of government documents that helped him spot stories that others didn't, such as the changing accounts from the administration of President Lyndon B. Johnson of the Gulf of Tonkin incident in 1964. The alleged attack on two U.S. naval destroyers moved the United States closer to war in Vietnam. Stone's newsletter was published until 1971 and at one time had more than 70,000 subscribers.

Paul N. Williams (1922–1976)

As managing editor of the *Sun Newspapers* in Omaha, Nebraska, Williams spearheaded an investigation into the nearby Boys Town institution for homeless and troubled youth in 1972. The team analyzed charitable tax filings and found an organization that was flush with millions of dollars in excess revenue. The stories led to the resignation of the director, an audit and other reforms, and also to a Pulitzer Prize in 1973—the first ever to a weekly newspaper. Williams soon took a job as a professor of journalism at Ohio State University, and he was part of the initial organizing group that led to the founding of IRE.

Williams was working on a textbook at the time of his unexpected death, and it was published posthumously in 1978. *Investigative Reporting and Editing* was the first text devoted to the practice, and it described a systematic methodology for pursuing an investigative story. The landmark method, sometimes called the *Paul Williams Way*, continues to be included in journalism textbooks.

Pam Zekman (1944–)

Zekman is a celebrated investigative reporter who worked at WBBM in Chicago for close to four decades. Before switching to broadcast—one of the first prominent print reporters to do so—she worked at both the *Chicago Tribune* and the *Chicago Sun-Times*. At the latter paper, Zekman was one of the main journalists involved in the famous Mirage bar investigation, the undercover sting that documented

pervasive corruption among city inspectors. The project was denied a Pulitzer Prize because of the controversial reporting tactics but lauded by many of Zekman's colleagues in investigative reporting circles. Her television investigations exposed corruption and fraud in government and businesses and have won every major broadcast award. In 2020, Zekman lost her job at WBBM amid companywide layoffs at station owner CBS.

J

JAPAN

Japan in the 21st century enjoys a respectable degree of free speech. Its constitution guarantees freedom of the press, acknowledging that journalistic practices contribute to the advancement of democracy. Yet certain restrictions of press freedom are in effect. The majority of journalism in Japan is a for-profit business, and the market is large and competitive. The development of communication technology accompanies the innovative means to distribute and receive information that supports journalistic practices, and for risk management and disaster prevention. Journalism in Japan may be characterized by the prevailing influence of national newspapers and Nippon Hoso Kyokai (NHK, Japan Broadcasting Corporation).

Since 2008, the population of Japan has been steadily decreasing and in November 2019 was estimated around 126.1 million people. In the census of 2017, 60% of the population was aged between 15 and 64 years of age, while 65-year-olds and above were around 27.7%. The natural Japanese life span is approximately 84 years, and combined with a birth rate as low as 7.6% in 2018, Japan is one of the most rapidly aging societies in the world. The average annual income per household in 2017 was ¥5.51 million. Compulsory education is from first to ninth grade for children between 6 and 15 years of age, and 97% of children enter high school for an additional 3-year

high school education. Roughly 82% of recent high school graduates advance to some type of advanced education, including universities and vocational colleges. The literacy rate in Japan is not surveyed, but it is reported to consistently reach 99%, or the average literacy proficiency among adults is ranked as the highest among surveyed nations according to Organisation for Economic Co-operation and Development Skills Outlook 2013. The availability of the Internet in Japan was approximately 79.8% in 2018. The usage is 90% between 13- and 59-year-olds, though less than 50% above 70-year-olds. Half of households whose incomes are less than ¥4 million per year have Internet access, whereas 80% of households with more income have Internet access at home. More than 40% of all age groups use the Internet to obtain news information, and among which more than 80% of those who are between 30 and 59 years of age use the Internet for that purpose.

This entry examines the history of print and broadcast journalism in Japan, Japanese news agencies, the ownership and financing of Japanese news companies, and the impact of digital technologies on the nation's journalism. This entry also examines the training of journalists in Japan and the nation's approach to journalism law and ethics.

Newspapers

The prototype of the contemporary newspaper existed as community newsletters in the early 19th century although severe restrictions were imposed

by the Shogunate government of the time. The modernization of Japan in the mid-19th century allowed Western knowledge and technology to influence society. Early newspapers, such as *Yokohama Nikkan Shinbun* and *Tokyo Nichinichi Shinbun*, were published in the Tokyo area in the 1870s.

Categorically, Japanese newspapers are *nikkan-shi* (broadsheet), *supootsu-shi* (equivalent to tabloid), or *gyokai-shi* (business, industry, and trade). There are five national broadsheet newspapers: *Yomiuri*, *Asahi*, *Mainichi*, *Nihon Keizai*, and *Sankei*. Daily circulation is led by *Yomiuri* at 8.1 million copies, the largest in the world, followed by *Asahi* at 5.6 million. These newspapers have extensive networks to maintain their ability for newsgathering. For instance, *Asahi* has approximately 300 local offices and 36 international offices, and an alliance with *The New York Times* and *HuffPost* of the United States, and *Dong A Ilbo* of South Korea. *Asahi* also owns 27 printing offices and over 3,000 sales offices nationwide, employing over 78,000 people for daily home delivery. Politically speaking, *Asahi* and *Mainichi* are viewed as Liberal Left, *Yomiuri* and *Sankei* as Conservative Right, and *Nihon Keizai* in the middle. *Asahi's* liberal voice is believed to have been targeted by an unidentified militant group in 1987 when two reporters were ambushed and shot at its Kansai branch office, resulting in one of them losing his life. Regionally published broadsheet newspapers are called *chiho-shi*, of which there are 50, catering to local interests that are specific to the region.

Eleven titles of *supootsu-shi* are also published daily, and companies that own national newspapers publish some of the titles, including *Nikkan Supootsu*, *Supootsu Nippon*, and *Supootsu Hoshi*. Their foci are on sports and entertainment news, gossip, and leisure information, featuring big and colorful banners and photos of sports and entertainment celebrities on their front pages. *Gyokai-shi* is a trade newspaper, covering the information needed by a specific commerce or industry, such as metal, transportation, real estate, and maritime shipping. For instance, *Nihon Kaiji Shinbun* is a broadsheet and online daily newspaper published during the week, reporting on the maritime industry, trade, and logistics with commentaries and analyses since 1942. Twenty-nine percent of

its audience are those who deal with logistics, 23% in the maritime business, and 15% in public and government offices. Other types of widely available daily newspapers include newspapers in English and horseracing newspapers.

The combined circulation of both broadsheets and tabloids in print was 71.9 million copies in 2000, but by 2019, it had decreased to 46.2 million copies. Japanese newspapers have been slow to shift to digital formats, and the increasing amount of online information has greatly contributed to the steady decline of newspaper circulation.

Yahoo! News, Line News, and Livedoor News are major content curators, or aggregators, of online news. Yahoo! News dominates the market, achieving 54% of weekly reach in 2019. It foregoes using algorithms and instead uses humans to select its top stories so that they can balance different perspectives and genres. However, a slight decline of reliance on online news was witnessed in Japan between 2013 and 2019, showing that the audience consumed more news from television.

Magazines

Journalistic magazines in Japan are called *ippan-shi* (general interest magazine). Eight hundred seventy-seven titles are currently released: 41 weekly, 40 bi-weekly, 464 monthly, and 332 other periodicals. Weekly general interest magazines called *ippan shukan-shi* are a popular format containing a variety of articles from political, social, economic, and entertainment news, commentaries, and other information with some photographs. Among them all, *Shukan Bunshun* has the highest weekly circulation of approximately 640,000, followed by *Shukan Gendai* at 462,000, and *Shukan Shincho* at 434,000 in the first quarter of 2019. With the steep decline in print circulation in recent years, they are also offering online subscriptions. They may be criticized for sensationalism and overtly sexual content, but they often provide in-depth reporting that may not be otherwise covered by the bigger daily newspapers. *Shukan-Bunshun* is known for *Bunshun-hou* (Bunshun cannon); its shocking exposé of matters from political corruption to celebrities' drug use. In addition to the weekly titles, *Bungei Shunju* is a

popular monthly general interest magazine, publishing close to 400,000 copies per edition.

General interest magazines that provide more of an emphasis on business, the economy and financial information are called *keizai-shi*. *Shukan Daiyamondo* and *Shukan Toyokeizai* are weekly magazines, circulating between 80,000 and 100,000 copies per week, and *PRESIDENT* is a bi-weekly magazine that circulates above 250,000 copies every 2 weeks. *Shashin-shukan-shi* is another popular genre of weekly magazine, focusing on photojournalism. Photojournalism has a long history in Japan, with three Japanese photographers having received the Pulitzer Prize since the 1960s. In 1981, *FOCUS* launched, and with its success, *FRIDAY*, *FLASH*, and others followed. Their photographs were often sensational, including crime scene photos and female nudity, replacing traditional articles. Although the trend was short-lived, *FRIDAY* and *FLASH* are still available in the market, selling 250,000 and 187,000 copies per week each in early 2019.

Broadcast

NHK is the public broadcasting network in Japan, which shows no advertising, and there are five additional commercial television networks, which are supported by the advertising revenues. These six networks have local affiliates throughout the country, and there are 129 television and 101 radio broadcast stations (48 AM and 53 FM). The Ministry of Internal Affairs and Communications oversees licenses for broadcasters, which are renewable every 5 years according to *Hoso ho* (Broadcasting Law).

NHK operates two broadcast channels, NHK General and NHK Educational with a subchannel for an alternative program. News programs occupy three large segments on NHK General, totaling 7 hours in its daily schedule. Additionally, a 5- to 10-min news program is broadcast at the beginning of every hour. The top rating news programs across all networks are mostly on NHK, and the highest rated news program is usually News 7, which is a 30-min digest of the day's most important information. NHK also provides news for special audiences, such as a Shuwa News 845 for users of sign language: a 15-min news program on NHK Educational

during the week and a 5-min program during the weekend.

NHK also distributes news programs through its satellite channels, radio, and online. It airs a 10-min news program every hour on BS-1, and the World News, which is a program of selected segments of news from other nations' networks, including BBC, KBS, CCTV, and Al Jazeera. NHK World, and World Premium via a satellite system, and NHK World Radio via short wave in 22 languages are other news sources for their overseas audience, in addition to its extensive website.

Commercial broadcast networks in Japan are TBS, Fuji TV, Nippon TV, TV Asahi, and TV Tokyo. However, TV Asahi and Tokyo do not have local stations in some prefectures, limiting their ability to reach out to a nationwide audience. These commercial networks offer a variety of news programs that overlap with NHK's news programs in the schedule. Among those, *news every* and *Shinso Hodo Bankisha* on Nippon TV, *Hodo Station* on TV Asahi, and *Joho 7 Days Newscaster* on TBS are ranked high in the ratings. Commercial networks also own satellite channels dedicated to news programs: Nippon TV operates *Nittere News 24*, and *TBS News* is a channel by TBS. Nikkei CNBC is a channel owned by CNBC Asia, TV Tokyo, and Nihon Keizai, distributing mainly business and financial news.

Since 2000, the above-60-year-old audience continues to watch television, but the number of hours significantly fell for those under 60, especially for those under 20. Nevertheless, the trust levels of online information were relatively low compared to television even among a young audience. The trend of Internet flaming and fake news is possibly making the audience in all generations more suspicious to what is distributed online. An example of disheartening fake news in Japan would be the story in 2018 about the release of confined passengers in the airport shuttle train to Kansai Airport during a typhoon, which falsely claimed the involvement of the Chinese Embassy. This false report contributed to a Taiwanese consulate member committing suicide.

News Agencies

There are five major Japanese news agencies, and among them, Kyodo Tsushinsha (Kyodo), and

Jiji Tsushin (Jiji), Radio Puresu (Radiopress), and JX Tsushinsha (JX) are journalistic organizations. Before and during World War II, Domei Tsushinsha (1936-1945) was organized as the first news agency in Japan to act as a gatekeeper of information. Once the war was over, its operations were inherited by Kyodo to distribute general news information, and Jiji took over the operation of the financial information.

Kyodo is a nonprofit cooperative organization that owns 45 local offices and 41 international offices and employs over 1,600 people. It has opened offices in Pyongyang, North Korea, and in Havana, Cuba, since 2006. It distributes information to NHK, 55 newspapers and 110 commercial broadcast stations, 40 Japanese overseas media, and over 500 ocean-going vessels. Organized in 1945 as a nonprofit general incorporated association by major newspaper companies and NHK, it is funded by membership fees and subscription revenues. Jiji is a for-profit agency with 78 local and 28 international offices. It developed ties with international agencies, such as Thomson-Reuters, AFP, and Dow Jones. Both Kyodo and Jiji distribute news information to their audience through their own websites, external online portals, and curators. Its stockholders include Kyodo and TV Asahi, and it distributes information to NHK and major newspapers.

The Ministry of Foreign Affairs originally founded Radiopress in 1941 as an agency to collect information from overseas. In 1946, it became an incorporated foundation that monitors media activities of communist nations to distribute information to government agencies and domestic media companies. Its most recent activity has been to monitor information from North Korea, but it does not inform the public of its own internal business. JX was established in 2008, with its main business being to distribute news information, collect data through surveys, and offer research and technology for news information search engines.

Ownership and Finance of Journalism Institutions

Five national newspapers are part of media conglomerates that own businesses beyond journalism. For example, the parent company of Yomiuri,

Kabushikigaisha Yomiuri Shinbun Honsha owns a baseball team, a television network, an amusement park, and a travel agency chain, to name just a few. Nihon Keizai focuses its business on publishing financial information through various outlets, from its newspaper to the Nikkei 225 or Nikkei Index, which is a stock market index for the Tokyo Stock Exchange. Most newspapers make their content available online even though it possibly cannibalizes print revenues. Their online subscription may be free of charge to those who register their personal information for limited access to the online content, or with a monthly fee for unlimited online access. Yomiuri takes a different approach by granting unlimited online access only to subscribers of the print edition.

As a publicly owned system, NHK collects subscription fees from the public. The fee to subscribe to its satellite system in 2020 was approximately ¥2,200 per month, or ¥25,000 per a year. Terrestrial broadcast subscription is approximately ¥1,300 per month or ¥13,000 per a year. In 2019, NHK's revenue was approximately ¥7.247 billion (\$6.788 billion), which is equivalent to the BBC's revenue of £4.889 billion (\$6.787 billion). NHK's budget has to be approved by the Japanese Diet, which acts as the representative of the public. Because the Diet has been mostly dominated by the Liberal Democratic Party since 1955, common criticism toward NHK has been that it avoids investigating the Liberal Democratic Party's political leadership, failing to focus on neutral reportage in order to maintain a good relationship with the government. Compared to NHK, each commercial network earns less revenue. Nippon TV earned ¥4.25 billion, TV Asahi ¥3.01 billion, Fuji TV ¥2.6 billion, and TBS ¥2.17 billion.

Technology

NHK's *Hoso Gijutsu Kenkyusho* (NHK Science & Technology Research Laboratories) has played a large part in the development of communication technology, which has enhanced the role and effect of journalism in contemporary Japan, for example the one-seg broadcasting system inaugurated in April 2006, allowing mobile phones to receive video and audio stream. In recent years, methods of video streaming on mobile phones have become more diverse. In March 2019, the

Supreme Court of Japan decided that owning a mobile phone that was equipped with the one-seg system would oblige the phone's owner to be responsible for paying a subscription fee to NHK. Before 2019, a variety of mobile phones incorporated the operating system to correspond to one-seg technology, nonetheless, more recent models of the iPhone that has a large share in the sale of mobile phones in Japan, no longer equip the system. Also, recently launched is NHK Plus, is an app that allows the NHK's programs to be viewable up to 1 week after being aired. These new developments have perhaps contributed to the decline of one-seg technology.

NHK is required by Saigai Taisaku ho (Act of Disaster Management), Kishou Gyomu ho (Meteorological Service Law), and Broadcast Law to assist in disaster management and to disseminate climate and terrestrial alerts issued by the Japanese Meteorological Agency. Even before the Tohoku Earthquake and Tsunami of 2011, the national emergency warning system called *J-Alert* was available through all communication devices. As an automated system, it relays signals sent by satellites and/or terrestrial wireless communication towers and sends out alerts to each municipality. The alerts are also relayed to television networks, including NHK to warn their audience. Broadcast networks also collect short videos from the public regarding disasters. NHK's Sukupu Bokkusu (Scoop Box) allows people to upload their videos to present a wider variety of urgent information in various geographical areas where reporters may not be present. NHK is also keen on promoting 4K and 8K technology, which is already available on satellite channels.

As an up and coming news agency, JX Tsuushinsha employs no reporters but utilizes AI technology to search information online to generate their version of the news. FASTALERT is a system that AI patrols online to search for news and distributes it to the press, public offices, and industry. For individual customers, its counterpart, NewsDigest sends out information through AI.

Education and Training for Journalists

The first department of journalism in Japan launched in 1932 at Sophia University in Tokyo.

Between 1945 and 1952, journalism courses and programs were established at universities in Tokyo, Osaka, and Kyoto with the support of the Allied Powers' General Headquarters. Currently, various universities offer journalism or media communication programs at the undergraduate level, including Sophia, Waseda, Keio, and the University of Tokyo. Keio houses an Institute for Media and Communications Research, and the University of Tokyo owns the Interfaculty Initiative in Information Studies, in which research on journalism has been conducted from the political, economic, technological, and cultural perspectives.

According to Oda Mitsuyasu, journalism education in Japan was mostly taught and researched in the field of social science; however, there never was a consensus of what journalism education should entail, or an in-depth discussion about the curricula for journalism education or the definition of journalism. In recent years, an increased number of universities have developed departments and/or schools in the field of mass media, information, and digital media. For instance, a survey conducted by the Japan Society for Studies in Journalism and Mass Communication showed that 20 universities offered at least 17 courses related to journalism or mass communication. While in another survey conducted in 2016 by the National Institution for Academic Degrees and Quality Enhancement of Higher Education, there were no journalism degrees at undergraduate level and three degrees at graduate level at Japanese universities. Available curricula include courses related to journalism, but theoretical media and communication courses are taught more frequently, excluding education on journalism ethics, technical writing, and the business of journalism. This approach may contribute to the preparation for a job search in a competitive market or educate a comprehensive critical individual. After all, new employees will be educated and trained to be journalists once they enter the workforce. Nevertheless, the criticism is that this type of education contributes more to guide students to be a part of a company within a particular company culture.

Law

Historically, the Japanese press has experienced a considerable degree of governmental censorship.

The first modern constitution between 1889 and 1945 did not guarantee freedom of the press, and the press often encountered prepublication censorship and postpublication punishment. Regulations from 1875 and 1909 restricted anti-government speech and activities, in addition to voluntary self-censorship by editors and publishers due to personal threats and persuasions. Under the post-World War II occupation, the office of the Supreme Commander for the Allied Powers restricted discussions of allied troop movements, and the broadcast of news and commentaries were limited to Radio Tokyo.

Article 21 of the current constitution explicitly protects freedom of the press, but neither Article 12 and 13, or the Supreme Court of Japan, has held that any right or freedom, including the freedom of the press, should be put in a preferred position in relation to the public welfare. Thus, distressing the public welfare at the expense of pursuing freedom of the press is thought to be an abuse of its rights.

According to the 2020 World Press Freedom Index, Japan's press freedom is ranked 66th among 180 nations. Tokutei himitsu no hogo ni kansuru horitsu (Specially Designated Secrets Act) and the role of kisha kurabu (Press Club) are considered as imminent threats to press freedom. Press Club is an association for journalists through which various kinds of press conferences are held, and there are more than a thousand smaller assemblies throughout Japan, providing information regarding political organizations, governmental agencies, economic institutions, and the Imperial Palace. The most representative is Nihon Kisha Kurabu (Japan National Press Club). The benefit of belonging to a press club is that journalists can obtain information without conducting independent investigations. However, reporters and news sources may maintain a mutual dependency leading to biased reporting. In addition, foreign and freelance reporters have difficulty accessing the press club. Disallowing freelance reporters to attend press conferences organized by a press club possibly impairs the development of civic journalism in Japan.

In 2016, David Kaye, the United Nations Special Rapporteur on the right to freedom of opinion and expression, expressed that the Specially Designated Secrets Act allows the government to

conceal certain information from the public if it is important or sensitive to national security. Furthermore, Broadcasting Law and the government pressure on journalistic neutrality and fairness creates a high level of self-censorship in Japan, suppressing public debate on topics including the discussion on the Fukushima nuclear power plant disaster in 2011, the U.S. military base in Okinawa, and comfort women during World War II. In their response to this report, the Japanese government argued that Kaye's findings were based on inaccurate and insufficient statements and hearsay, claiming it to be a biased recommendation without concerning the actual sensitivity of Japanese culture.

Ethics

Various institutions have strict guidelines to maintain ethical journalistic practice. Nihon Shinbun Kyokai (Japan Newspaper Publishers & Editors Association) endorses The Canon of Journalism, emphasizing freedom and responsibility, accuracy and fairness, independence and tolerance, respect for human rights, and decency and moderation. Housou Rinri Bangumi Koujou Kikou (Broadcasting Ethics & Program Improvement Organization) upholds the broadcast ethics standard guidelines, which utters a very similar vision to maintain the principle as mass communicator.

However, the press implements certain self-restrictions to maintain its freedom and responsibility. Houdou kisei, or press self-restraint, is an example for avoiding conflict with Shonen ho (Juvenile Law). Under Article 61 of this regulation, the publication of personal information about an individual under 20-years-old should not be published when they are found guilty in a family court or if they are prosecuted on suspicion of a crime that was committed by the age of 20. Yet, the publication of the information is still allowed if they were only arrested or wanted, and the regulation does not impose a penalty. Since the late 1980s, some of the press began publishing such information, asserting that the publication of such information is for public safety and interests. In some cases, they also claim that the anonymity of the delinquent juvenile is held for the purpose of supporting their rehabilitation after the sentencing, but if they are on death row, their personal information should no longer be restricted.

Current and Future Challenges

According to the Ministry of Internal Affairs and Communications's 2019 White Paper, we live in an era in which the saturation of information and communication technology enhances our lives in a better direction through digital transformation. The expectation is that the digital transformation will help Japan as an aging society to continue its economic growth, strengthen community, and advance the diversity in society.

However, merely observing the advancement and convenience of the communication technology in relation to journalism in Japan will miss the underlying problems that often exist in the realm of history and culture. The audience seems to trust national organizations that have not only power to connect and produce news information but also their history, reputation, and prestige as an authentic information source. The authority of the constitutional protection of public welfare over individual rights and freedom, and the enduring power of the press club in information gathering are unique aspects reflecting values and beliefs within Japanese culture, yet at the same time, these matters have an innate influence over journalism practices in Japan.

JOURNALISM AND GLOBALIZATION

Globalization is the continuing and evolving process of increasing communication interconnectivity between geographically distant and diverse populations, cultures, and economies. This is usually, though not always, brought about by technological advances in transportation and communications and through virtual interactions. Just as journalism has been affected by global interconnections, globalization also has been part of many news stories in recent years.

Two phenomena of globalization in regard to journalism are particular noteworthy. The first is the public's expectation of instant international news as part of the now-standard 24-hour news cycle and the influence of this expectation on the practice of newsgathering. The second is the expectation of ongoing cultural exchange between previously separate and diverse groups of people. Of this increased cultural exchange, some scholars see increased diversity and hybridization of cultures (pluralism), while others see an extension of an Anglo-American corporate hegemony (cultural imperialism). Evidence for both outcomes has been found in academic investigations and media research. This entry discusses the history and development of globalization, how it has changed mass media and journalism, and coverage of globalization and the backlash against it.

History and Development

The continuing improvement of technologies of transport, distribution, and communications has been integral to globalization. Globalization in the modern sense began with the industrial revolution in the mid-19th century with increased speed of information along with trade and continues to

evolve in the 21st century through the global communications system and Internet. Many antecedents of contemporary globalization can be found, including the network of trade routes known as the Silk Road that connected China and the Far East to the Middle East and Europe beginning in 130 BCE, and the religions that spread along with empires, notably Catholicism and Islam. Global religions create and continue the process of globalization through complex ecclesiastical hierarchies, traveling missionaries, and pilgrimages.

By the late Middle Ages, trade and craft guilds had established systems for traveling journeymen and masters, which increased the exchange of knowledge and ideas. Through these proto-globalizing trends, information was collected by travelers and brought together in central locations for use by ruling elites, merchants, and religious officials. As such, journalism and newsgathering evolved together with travel and nascent globalism.

The rise of nationalism worked against globalization for centuries as newly formed nations established national or ethnic identities by defining what they excluded. The establishment of an educated merchant class, usually in coastal city-states, required information to facilitate trade. City-states evolved into larger nation-states. Due to the cultural nature of globalization and its foundation in multilingual communication, it has been inextricably linked to forms of cultural information exchange, including journalism.

Premodern postal systems contributed to the flow of information. In the 16th century, the Holy Roman Empire established a transnational system of mail delivery, the Thurn-und-Taxis Post, which was licensed to carry mail and journals between population centers. The free flow and delivery of these communications led to the use of the word *journalism* to describe regularly delivered reports from correspondents from different countries within the mail delivery system. Reports of internationally newsworthy events became essential to both governance and trade. This premodern postal system continued into the 19th century when it was replaced by mail delivery treaties between nation-states.

The character of globalization changed drastically with the beginning of the industrial revolution. Some technologies, such as steamships,

allowed for faster travel and facilitated global interconnections. However, it was the development of telegraphy in the 1840s that most radically encouraged globalization. Telegraphs were first used by Great Britain and the United States. The development of undersea telegraph cables in the 1860s, and wireless telegraphy at the turn of the 20th century, dramatically speeded up cross-border communication.

Although early telegraphy allowed for faster newsgathering and the development of international newswire services, it was the application of wireless technology for radio broadcasting by the 1920s that allowed for large groups of geographically and culturally diverse populations to be seen as one single audience. Point-to-point and broadcast radio expanded alongside each other and were used to form the first broadcast networks. These involved (by the late 1930s) a central news collection organization linked to dozens of affiliate stations. While the network itself used point-to-point wired communications to link affiliates, the stations used broadcast technology to reach their audiences.

Expansion of Global Communications

Truly rapid global communications began with undersea telegraph cables in the 1860s and expanded with the adoption of shortwave and broadcasting in the 1920s and 1930s and microwave point-to-point communications in the 1940s and 1950s.

Unlike medium-wave radio broadcasting, shortwave signals are bounced along the ionosphere and reflected back to the earth's surface thousands of miles from their broadcast source. This technology allowed a few, usually government-controlled, broadcasters to reach audiences around the world. The most notable drawback to shortwave radio is limited bandwidth. Thus, shortwave broadcasts are heavily regulated by international treaties and often exclude smaller broadcasters. This perceived notion of exclusion initially led to many so-called pirate broadcast stations that operated in international waters (Radio Caroline, broadcast from ships anchored off Britain), across international borders (Radio Luxembourg, which broadcast to Western Europe and especially Britain), or in areas with little government oversight (Radio Swan near

Cuba). The rise of satellite distribution in the 1980s and Internet audio streaming radio early in the 21st century has greatly diminished the role of pirate radio.

The growing number of broadcast, cable, and satellite-based electronic media systems led to a "network of networks": the Internet and the World Wide Web. While the Internet was created in the late 1960s by an agency of the U.S. government, it was used for academic, military, and government communications nearly exclusively until the wide-scale proliferation of personal computers and a standardized Internet protocol for the graphic display of information. The resulting system, the World Wide Web, developed in Switzerland and introduced to the public in 1991, continues to use the infrastructure of the Internet for commercial, journalistic, and entertainment purposes.

Looking at the explosive growth of communications technology in the mid-20th century, media researcher Marshall McLuhan made the now famous observation that humanity would soon be living in a "global village." McLuhan's global village model has been criticized for being based on assumptions that were flawed and vague, but his ideas gained acceptance and are still widely used when discussing global media and globalization. Proponents of McLuhan's vision point to the growth of the World Wide Web and mobile communications devices as examples of the continuing relevance of McLuhan's model. Detractors believe that the model does not take into consideration large-scale media conglomerates and the effect of governments on mass media.

Globalization and Mass Media

In 1956, communications researchers Fred S. Siebert, Theodore Peterson, and Wilbur Schramm posited four types of media organizations around the world: authoritarian, libertarian, Soviet communist, and social responsibility. Criticized even at their introduction as too simplistic, these four cold war categories still have some relevance in the 21st century. Despite the technological movement toward digital global corporate culture, individual nation-states and regions maintain unique journalistic media. Yet digital technologies can readily permeate national borders and allow

for journalism to cross borders, with less ability for governments to exert control aside from blocking websites.

The rise of transnational media corporations has greatly aided the movement of journalism across borders. One of the best-known examples, Rupert Murdoch's News Corporation, holds newspapers (e.g., *The Times*, *The Wall Street Journal*) and broadcast, cable, and satellite networks (Fox Broadcasting Company, Fox News). Other examples of transnational media corporations include Bertelsmann, Sony, Vivendi, The Walt Disney Company, and WarnerMedia.

International organizations and trade agreements have been created around the complex issues surrounding globalization and mass media. During the 1970s, the United Nations Educational, Scientific and Cultural Organization attempted to establish news guidelines called the *New World Information and Communication Order*. These guidelines were intended to equalize treatment and coverage of developing and industrialized nations but were heavily criticized by the United States and United Kingdom. In 1995, the World Trade Organization was formed to institutionalize international agreements on trade. Within the World Trade Organization, the General Agreement on Trade in Services is an evolving framework of treaties that includes global entertainment and worldwide news distribution.

Growing international trade and corporate ownership of technologies for communication have moved most nation-states toward the social responsibility and libertarian models originally proposed by Siebert, Peterson, and Schramm. Proponents of globalization in media production and in newsgathering and distribution favor the model of an open marketplace of ideas. Opponents of this form of globalization counter that it places profitability ahead of media access.

McLuhan, Jacques Ellul, Neil Postman, Walter Lippmann, Edward Bernays, and Daniel Boorstin all contributed to thinking about global media culture in the 20th century. Contemporary media critics and scholars who have written about the issue include Robert McChesney, Ben Bagdikian, Noam Chomsky, Naomi Klein, Henry Jenkins, and Lawrence Lessig. Lessig was trained as a copyright and intellectual property lawyer and argued several cases before the U.S. Supreme

Court. He was one of the leading members of the open-source movement, which has evolved around free, editable software, such as Linux, but has grown to encompass scientific research, music, photography, and online collaborations, such as Wikipedia. As a practicing attorney, Lessig has also worked to design legal methods where copyright protection could be extended across global borders.

Backlash Against Globalization

Within both journalism in particular, and in government and business in general, there has been a backlash against the practices, policies, and outcomes of neoliberalism, globalism, and globalization. Among these responses has been a return of nationalism, ethno-nationalism, anti-globalism and World Trade Organization protests, and cross-border regional and tribal movements. Each of these phenomena have used digital media production and web-based and occasionally cable news journalism to seek to legitimize their continued existence and anti-globalism in the broader context of global media. International journalists have followed stories that are created by these movements and their specific media outlets.

Examples of nationalist media criticizing globalism include cable news organizations aligned with far-right political groups in developed nations and those controlled by government forces in developing nations. While specific ethno-nationalist media outlets tend to be smaller and exclusively web-based, they can assert influence on other media outlets. Existing nation-states and larger international organizations, such as the European Union and United Nations, have worked to counter misinformation by extremist groups and unattributed news leaks.

Relationship Between Journalism and Globalization

Many of the changing social trends in newsgathering and reporting can be linked to emerging globalization of mass media. The spread of both Western consumerism and laissez-faire democracy throughout the world during the 20th century changed how audiences interact with their news sources. Both increased democratic participation

and intrusive corporate marketing make new demands on and new models for journalism in a globalized world.

Older models for journalism took a mass production approach to mass media and continue to privilege journalistic objectivity, the use of public intellectuals and experts as sources, tight scripting formats, and attempting to give neutral facts to an audience. In the late 20th century, newer niche market approaches to mass media began to embrace (or at least admit) a political or cultural point of view, more frequently assess and interpret facts for an audience, rely more on public opinion and vox populi interviews, and openly criticize or advocate political parties or regimes. While becoming increasingly commercialized, newer models of journalism in a digital, globalized world focus on putting individual stories in a context for their audience. This is thought to be a reaction to the 24-hour news cycle and information overload that can be created by the news industry itself.

In the early 21st century, emerging trends in journalism and globalization are the adoption of a global form of English for news coverage along with the rise of multiple-language reporting by large newsgathering organizations. Simultaneously, hyperlocal community-based journalism and other forms of user-generated content are increasingly used as story leads for professional journalists. For example, both CNN and the BBC include viewer-submitted stories on their websites. Thus, stories that previously would not have been reported on due to distance, lack of field reporters, or political pressures can move easily from very small news organizations to a large global conglomerate in a short time.

From the early days of the Internet, proto-social platforms such as the USENET and other messaging bulletin board systems allowed for research and newsgathering. During the early 1990s, the rise of HTML standards, graphics standards, and moderated group messaging made the spread of global online discussions possible. Technology firms such as AOL, Yahoo, and others hybridized news distribution with group hosting and chat functions. By the mid-2000s, mobile applications and social media platforms such as Facebook and Twitter began to serve as engines of connection and globalization, used for collecting information, broadcasting, and promotion.

Despite cutbacks in international reporting at many U.S. news organizations in recent years, national news outlets and wire services continue to cover global news stories including military engagements, trade negotiations, immigration and migration, disease outbreaks and pandemics, pop culture and entertainment, and Internet-based video gaming. There is an essential paradox of globalization in the production and distribution of global journalism. Along with the greater bandwidth and the number of media outlets within new media overall, there is a simultaneous conglomeration of both ownership and content. In the same fashion that journalism grew and changed with improvements in transport, communication technology, and growing industrialization, it will continue to be a leading part of globalization.

JOURNALISM AWARDS

Journalism has a rich, though sometimes criticized, culture of prizes and awards. This entry first discusses the best known and most prestigious journalism award in the United States, the Pulitzer Prize. It then looks at awards given outside of the United States and other awards within the United States, including those given by foundations, professional groups, and universities. It concludes by discussing the popularity of journalism awards and their downsides.

Pulitzer Prize

A year after the first Nobel prizes were awarded, in 1901, Hungarian-American Joseph Pulitzer, the publisher of the *New York World* and *St. Louis Post-Dispatch*, wrote that he had a “germ of an idea” about a similar award in U.S. journalism and letters. When Pulitzer died in 1911, he left \$2

million to fund the Pulitzer Prizes and establish a journalism school at Columbia University in New York.

Pulitzer’s 1904 will originally called for journalism prizes recognizing public service rendered by a newspaper, editorials, reporting, the best history of services rendered to the public by the American press in the preceding year (awarded only once), and the best paper on the development of Columbia’s School of Journalism (never awarded because of a lack of submissions), along with prizes in letters and drama. The will, however, gave the board assigned to oversee the awards the authority to alter the prize categories. Since the awards were first given in 1917, there have been a number of changes to the journalism awards, including the acceptance of work done online by newspapers (1997) and work done by online-only news organizations (2009), as well as the creation of an audio reporting category (2020). As of 2020, there were 21 Pulitzers awarded annually at ceremonies in April, including journalism prizes for public service journalism, breaking news reporting, investigative reporting, explanatory reporting, local reporting, national reporting, international reporting, feature writing, commentary, criticism, editorial writing, editorial cartooning, breaking news photography, feature photography, and audio reporting.

The Pulitzer Prizes have been criticized because the board that decides them deliberates in secret, occasionally deciding not to honor any of the three finalists named by the jurors reviewing entries for a category; because the honorees have been overwhelmingly white and male (84% before 2016); and because the prizes have been dominated by a few elite news organizations: *The New York Times*, *The Washington Post*, the *Los Angeles Times*, *The Wall Street Journal*, and the Associated Press. In addition, scandal has sometimes marred the Pulitzer record. In 1981, *The Washington Post* gave back the Pulitzer for feature writing awarded to Janet Cooke for the story of an interview with a supposed 8-year-old heroin addict after Cooke admitted that the boy she wrote about was a fabricated composite of young users she had heard about from social workers but never met.

In 2003, *The New York Times* publicly conceded, not for the first time, that reporting on the

Soviet Union by Walter Duranty, which won the 1932 Pulitzer Prize for Correspondence, consistently underestimated Joseph Stalin's brutality, taking propaganda at face value and dismissing reports of famine that killed millions of people in the Ukraine. Nonetheless, the Pulitzer Prizes have been extraordinarily influential on U.S. journalism, serving as a professionalizing impulse and socializing the field for more than 100 years about what journalism is worthy of merit.

Awards Outside the United States

Many countries have national journalism awards. In France, the Prix Albert Londres, named for a French investigative reporter killed in an ocean-liner fire in the prime of his career, has been awarded since 1933 to Francophone print, audiovisual, and book journalists 40 or younger. In Canada, the National Newspaper Awards have honored daily newspaper achievements since 1949. The prizes—established and run for 40 years by the Toronto Press Club—are administered by a nonprofit board that makes awards in 26 categories, including editorials, breaking news, beat reporting, and presentation/design. In Brazil, the prizes now known as the ExxonMobil Journalism Awards were founded in 1955 at the suggestion of Ney Peixoto do Vale, a former journalist who started the press office at the oil company Esso and was inspired by the Pulitzers.

In Australia, the Walkley Awards, established in 1956 by oil executive Sir William Gaston Walkley, give honors in 30 categories, including investigative journalism, news event coverage, business journalism, sports journalism, coverage of Indigenous affairs, and even headline, caption, or “hook” writing, both across all media and specifically in video and film contexts. In Great Britain, the Press Awards (formerly the British Press Awards) have been honoring primarily print journalism since 1962. Formerly run by the *Press Gazette*, a trade magazine, and now by the Society of Editors, the awards name a newspaper of the year, a front page of the year, and a news website of the year, in addition to giving more traditional reporting awards. In India, the Ramnath Goenka Excellence in Journalism Awards were established in 2005 by the Express Group of media outlets to honor its

founder, who died in 1991. They honor print/digital and broadcast journalism at a ceremony where the Indian president, Ram Nath Kovind, has given a speech in recent years.

Foundation Awards

Some awards are given by foundations closely linked with journalism. In the United States, for example, the Scripps Howard Awards are sponsored by the Scripps Howard Foundation, the philanthropic arm of the E.W. Scripps, a former newspaper company now focused on broadcast and digital media. Those awards give prizes annually for journalism in 16 print/digital and broadcast categories, including visual journalism, environmental reporting, breaking news, and human interest storytelling. The Hearst Awards, given since 1960 to student journalists at U.S. colleges and universities with journalism programs accredited by the Accrediting Council on Education in Journalism and Mass Communication, are a program of the Hearst Foundation, created in 1948 by newspaper publisher William Randolph Hearst. The awards, sometimes called *the Pulitzers of college journalism*, provide prizes for writing, photojournalism, radio, television, and multimedia journalism, with top student journalists and journalism programs in each category receiving \$10,000 awards in 2020.

Professional Group Awards

Many journalism awards are given by professional groups. In the United States, the Society for Professional Journalists offers multi-platform national Sigma Delta Chi Awards for professional journalists, dating back to 1932, and regional and national Mark of Excellence Awards for college student journalism. Since 1966, the American Society of Magazine Editors has given the National Magazine Awards—sometimes called the *Ellies* because winners receive a statuette based on artist Alexander Calder's “Elephant Walking”—in association with the Columbia Graduate School of Journalism. Since 1971, the organization now known as the Radio Television and Digital News Association has given the Edward R. Murrow Awards for local and national broadcast and digital journalism.

Niche-based and newer U.S.-based professional organizations have been quick to adopt the practice of giving awards. For example, annual awards are given in the United States by the Education Writers Association (founded in 1947), the National Association of Black Journalists (1975), the Society for News Design (1979), the Asian American Journalists Association (1981), the Native American Journalists Association (1983), the National Association of Hispanic Journalists (1984), the Society of Environmental Journalists (1990), ACES: The Society for Editing (1997), the Online News Association (1999), and many other professional groups.

University Awards

A number of journalism awards are associated with universities. The George Foster Peabody Awards for radio, television, web, and podcast journalism—created by the National Association of Broadcasters and first given in 1941—are housed at the Grady College of Journalism and Mass Communication at the University of Georgia, a beneficiary of their namesake, a businessman and philanthropist from Columbus, Georgia. The Alfred I. Dupont-Columbia University Award for broadcast journalism was based from 1942 to 1967 at Washington and Lee University in Lexington, Virginia, before moving to New York City.

The George Polk Awards have been given since 1949 by Long Island University in New York in memory of a CBS correspondent murdered in 1948 while covering the Greek Civil War. The Gerald Loeb Awards for business reporting, established in 1957 by a founding partner of the stock brokerage firm E. F. Hutton, are overseen by the Anderson School of Management at the University of California, Los Angeles.

Popularity and Downsides of Journalism Awards

Journalism awards are popular, most scholarship on the topic has argued, because journalists (like other workers) find that receiving awards from, or in front of, their peers confers prestige—an attribute sorely missing from jobs that offer only modest salaries and frequently draw public

distrust. Winning an award also can be a key to mobility, a chance to attract the eye of hiring managers at larger or more elite news organizations, which offer better pay, wider audiences, or both. Awards to individual journalists also reflect glory on their broader news organizations, which often tout the prizes in their promotional materials or put them on public view in their offices. More important, awards can focus needed attention on urgent societal ills, as the Pulitzer Prize Board did when it awarded the 1922 prize for public service to the *New York World* for its investigation of the Ku Klux Klan. Over the next 6 years, five other newspapers earned Pulitzers for their exposés of the white supremacist group's activity in their states.

Journalism prizes also have a downside, however. The sheer number of awards in the United States means that at some news organizations, entering contests—all of which have different requirements—takes an extraordinary amount of time that might have otherwise been spent on serving the information needs of the news organization's audience. Costs can be significant as well. For example, Online News Association members paid \$100 per entry in 2020 to submit the Online Journalism Awards, and American Society of Magazine Editors members paid up to \$395 per entry for the Ellies.

JOURNALISM EDUCATION

The development of journalism education in the United States initially focused on preparing students for careers in newspapers before it was disrupted first by local and network radio and television news, then cable broadcasting, and finally the Internet. Journalism and media communication (JMC) education for decades has included large numbers of students focused in the areas of public relations and advertising, but social media marketing and digital entrepreneurship have further transformed journalism education in recent years. This entry first discusses the origins of formal journalism education in the United States. It then looks at the first higher education programs, professional associations, and academic journals in the field of journalism. The entry concludes by discussing recent shifts in JMC education, including those caused by the advent of digital technologies.

Journalism has long been defined by its collection of stories—news, information, and entertainment—produced within an editorial process that leads to publication through various distribution methods. In the United States, by the 19th century, mass distribution of newspapers began to standardize through professional norms. The invention of the penny press, as well as development of a prestige press, followed the push toward formal education and training of reporters and editors.

Professionalization and Education

The emergence and rapid growth of mass newspapers in the United States during the 19th century coincided with increasing literacy levels and waves of immigration. The shift from traditional rural culture to urban and industrialized cities required new ways to share news and information. Larger newspapers hired reporters, writers, and editors to produce daily newspapers, and this required development of practical skills.

The Institute of Journalists (1833), the American Newspaper Guild (1933), and professional/trade organizations in France and elsewhere formed during the 19th and early 20th centuries. U.S. Civil War reporting introduced the inverted pyramid writing style with the most important news at the top. The Associated Press newspaper cooperative emerged as a prestigious news agency. The number of newspapers in Europe and the United States doubled by 1900. The penny press style in New York iterated into yellow journalism, with an emphasis on crime news, political scandal, and sports. Department store advertising gradually led to women’s and home lifestyle content. Meanwhile, Protestant missionaries in China and reformers in Japan published stories and papers, and national newspapers emerged after the imperial overthrow in 1911. These developments motivated the earliest U.S. journalism schools.

Journalism Schools

While there were some courses in journalism at U.S. colleges and universities in the late 19th century, significant early influences on journalism education came from universities in the Midwest in the early 20th century. In 1908, the University of Missouri established the world’s first school of

journalism. The University of Wisconsin, which offered its first journalism course during the 1904–1905 academic year, formed its journalism department in 1912. The universities of Wisconsin and Missouri offered slightly different perspectives on journalism education, with a focus on liberal arts curriculum at Wisconsin and professional training for the newspaper industry at Missouri. The University of Missouri School of Journalism, founded by Walter Williams, used a hands-on approach called *the Missouri Method*. The school later added a master's degree (1921) and doctorate (1934). Another early journalism school was the one founded at Columbia University in New York in 1912, funded by a grant from newspaper publisher Joseph Pulitzer.

The founder of the journalism program at the University of Wisconsin, Willard G. Bleyer, started offering instruction in journalism there soon after earning his PhD. in English in 1904. The former newspaper reporter was promoted to assistant professor in 1911 and professor in 1916. During this period, on November 30, 1912, he was among 18 educators voting to create the American Association of Teachers of Journalism (AATJ), which later became the Association for Education in Journalism (AEJ). The Wisconsin Department of Journalism became the School of Journalism in 1927.

Fred S. Siebert (a news reporter turned legal scholar) left study with Bleyer in 1923 and earned a law degree in 1929, then rose to professor and director of the University of Illinois School of Journalism before joining the Michigan State University School of Journalism and Division of Mass Communication. He served as dean of the MSU College of Communication Arts from 1960 to 1967. Siebert's *Four Theories of the Press*, first published in 1956, comparatively examined systems around the world.

Ralph Droz Casey used his University of Wisconsin doctoral thesis about propaganda in the 1928 presidential election to establish the University of Minnesota as a journalism education center. Others who studied under Bleyer included Ralph Nafziger, who served as director of the University of Wisconsin School of Journalism from 1949 to 1966 and created a research division that focused on his interest in agricultural journalism, and Chilton Bush, who became head of the

Department of Communication at Stanford University in California in 1934. Bush helped to create a journalism curriculum that emphasized courses related to social intelligence and the newspaper as a social institution along with instruction in practical skills.

Professional Associations and Academic Journals

In 1924, the American Association of Teachers of Journalism created *Journalism Bulletin*, later renamed to *Journalism Quarterly* (JQ) and then *Journalism & Mass Communication Quarterly*, to publish mass communications research. By 1954, the journal also published a regular forum on teaching, report on current journalism research, book reviews, and a directory of journalism teachers that listed fewer than 1,000 names. An article published in the journal listed popular research topics: advertising and marketing; censorship; chains and consolidation; college journalism; community newspapers; content analysis; ethics and criticism of the press; foreign and international journalism; high school journalism; history and biography; law; magazines; newsgathering and writing; personnel; pictorial journalism; production and management; publics and public opinion; public relations, propaganda, and publicity; radio and television; readership and readability; and religious journalism.

AEJ, which replaced the American Association of Teachers of Journalism in 1950, was supported in its research publication efforts by the Association of Accredited Schools and Departments of Journalism and the Kappa Tau Alpha Society. As news media grew, there was increasing demand for journalism graduates. Until the start of the Great Depression, demand for graduates exceeded availability.

There is no way to overstate the importance of World War II on journalism education. Wilbur Schramm had been a University of Iowa Department of English faculty member before the war but returned to universities after the war with a broadened understanding of the intersection of mass communication and speech departments that offered courses such as interpersonal, nonverbal, international, and intercultural communication. Schramm, Nafziger, and dozens of other scholars

joined the Office of War Information during the war and came away with practical research methods about persuasion.

According to Schramm, the social, political, and psychological research of Kurt Lewin, Paul Lazarsfeld, Carl Hovland, and Harold Lasswell were critical in the development of the study of communication in the United States. The emphasis on, for example, presidential election studies helped build the communication field around important constructs, such as news gatekeeping, agenda setting and building, diffusion of innovation and adoption, personal influence and opinion leadership, as well as other research. It became common by the 1960s for new professors to have a doctorate in communication or a related field. These journalism educators tended to apply concepts and theories to journalism education.

The Journalism Educator (JE) began after World War II as a newsletter for the American Society of Journalism School Administrators (ASJSA), and in 1970 announced “an expanded cooperative effort” with AEJ’s journal, *JQ*. The American Society of Journalism School Administrators President Donald R. Grubb (1970) reported that *JE* would provide information on developments involving AEJ members, departments, and schools; a forum for the exchange of ideas; and “an outlet for interpretive and controversial ideas about teaching, laboratory, and research techniques” (p. 2). Journalism educators also used the journal to promote the annual AEJ convention, report divisional news, list new books, and review selected books in the field.

The idea was to distribute at least one publication per month from three AEJ outlets—*JQ*, *JE*, and *Journalism Monographs*. *JE* focused on “the journalism classroom teacher, sharing with readers common problems, innovations, and aspirations” (Grubb, 1970, p. 3). A business professor’s study published in *JQ* found that between 1947 and 1970 newspaper employment grew more than 50.2% to 373,000 jobs, and journalism educators were not keeping up with expected growing demand during the 1970s. Watergate reporting by *The Washington Post* and *The New York Times*, the Vietnam War and civil unrest, and the growth of local and national television news magnified these trends.

The Great Depression and World War II were “turning points” for society, journalism practitioners, and journalism education. As journalism education became available at 60% of U.S. universities during the post-war baby boom, there were “major criticisms of the appropriateness of their existence” amid a struggle in the 1970s over whether or not journalists should be called *professional* (Crook, 1994, p. 4). There was a split between those requiring professors to hold graduate degrees and programs following accreditation standards based upon the news industry.

Newspapers and radio news had emerged from World War II as vital democratic institutions. University of Chicago President Robert Hutchins headed the Commission on Freedom of the Press at the request of *Time* magazine publisher Henry Luce. There were questions about role of media and its ownership. The Hutchins Commission took 4 years to write its report on social responsibility of the press, which was published in 1947.

In 1945, 15 campuses chartered the American Association of Journalism School Administrators to promote the practice of journalism education and teaching standards: University of Arkansas, Creighton University, Drake University, University of Florida, Michigan State College, University of Nevada, University of North Dakota, Oklahoma A&M College, University of Pennsylvania, South Dakota State College, Southern Methodist University, Texas Christian University, Texas Technological College, Tulane University, and West Virginia University. By 1948, the American Council for Education in Journalism accredited 35 major universities, including those with a research focus. General education in the liberal arts made up about 75% of course work, and skills courses were limited to about 25%. Change was coming to journalism education because of the development of radio, and later television, news.

Beginning in the late 1920s radio, and later television, became regulated industries in the United States. The Radio Act of 1927 created the Federal Radio Commission, which was replaced by the Federal Communications Commission (FCC) with the passage of the Communications Act of 1934. A 1943 U.S. Supreme Court ruling affirmed the government’s power to regulate broadcasting under the First Amendment. In 1949,

the FCC began to implement the fairness doctrine requiring broadcasters to discuss matters of public concern from multiple points of view, a rule upheld by the Supreme Court in the 1969 decision in *Red Lion Broadcasting Co. v. FCC*. The FCC also dealt with concerns about station formats, news distortion, and hiring diversity. FCC powers faded beginning in the 1980s as a result of broadcast deregulation, the emergence of cable, and digital audio and video. The FCC revoked the fairness doctrine in 1987 and eliminated it completely in 2011.

Digital Disruption

The Internet emerged during the 1990s, and the 1997 Supreme Court decision in *Reno v. American Civil Liberties Union* gave those publishing on the Internet strong First Amendment rights. The Telecommunications Act of 1996 modernized regulation, and journalism educators faced new challenges. Broadcasting courses shifted to teach electronic newsgathering, and campus radio and television stations went from operating through analog signals to digital signals. The introduction of the World Wide Web during the 1990s meant that all media would eventually have an important Internet presence, develop mobile phone apps, and use Facebook and other social media platforms. New courses were developed in the areas of mobile news, computer-mediated communication, media entrepreneurship, social media, and others.

In 1982, AEJ became the Association for Education in Journalism and Mass Communication and grew into an international association with thousands attending the annual meeting and a growing number of divisions and journals that expanded after 1964. The original teaching, research, and service purposes remain. The National Communication Association, the International Communication Association, the World Journalism Education Congress, the Association of Internet Researchers, the Broadcast Education Association, the Journalism Education Association, and others reflect an increasingly global view of free expression, data privacy, human rights, and other international concerns.

As of 2020, the Accrediting Council on Education in Journalism and Mass Communications accredited 117 schools (112 full and five

provisional), or about one-third of all journalism education programs. Many unaccredited programs, departments, and schools also embrace a liberal arts perspective on journalism education. Schools of communication frequently include JMC programs within a broader umbrella of communication studies that grew from speech and broadcast programs. While journalism education serves as training for working journalists, they also may have studied English, political science, history, and other fields.

Degree programs frequently match students with a relevant internship to gain practical experience before graduation. On-campus newspapers, radio, and TV stations also offer opportunities to cultivate professional skills. Increasingly, faculty benchmark abilities and measure growth through a capstone course. JMC academic programs also serve those students seeking employment in public relations, advertising, integrated marketing communication, social media, and emerging communications areas.

Since the 1990s, college and university journalism programs have increasingly emphasized digital storytelling across professions and platforms. Convergence of multimedia tools drove departments and schools to merge curricula and teach mobile media storytelling skills. Agile journalism programs found a path to survival by embracing the liberal arts and strategic skills, such as media writing and storytelling. Many journalism programs attracted new students by merging or collaborating with other areas, such as communication studies, computer science, and marketing. The critical thinking, researching, and writing skills taught in JMC programs have value that can be applied to many professional fields.

JOURNALISTIC TRANSLATION

Translation, or interlinguistic transfer, is closely associated with the birth of journalism and remains central in contemporary news production. This entry reviews the history of journalistic translation, from the early modern period to the present age, and discusses the role translation has played in contemporary journalistic practices.

Early Modern Period

During the early modern period, considered the beginning of journalism, both handwritten newsletters and print news pamphlets had to undergo several translation processes before they reached the target readership. The early *Gazettes*, *Relaciones*, *Avvisi*, and *Corantos*, to mention a few, published news gathered in the European continent by informants, spies, and eyewitnesses. Not only did the accounts have to be translated into the specific language of a specific publication (say a Dutch *Coranto*), but later they were translated into other languages as well (e.g., English, Russian).

Amsterdam and other Dutch cities were important centers of news production despite the minority status of the Dutch language in Europe. The widespread use of the printing press, the growth of the cities, and the fact that the Low Countries were at the crossroads of several languages and cultures turned this area into the news capital of Europe. It is believed that Amsterdam may have

published as many as 140 periodicals at one time in the 17th century. However, not all these pamphlets were published in Dutch. In fact, Dutch newspapers were translated into French, Italian, English, and Yiddish and then sold in other parts of the continent. For instance, *Tijdinghen uyt verscheyde Quartieren* was published in Dutch on Saturdays, while its French version, titled *Nouvelles de divers Quartiers*, appeared on Mondays. The *Oprechte Haerlemse Courant* circulated in German, Swedish, Russian, and English.

The English versions are of particular interest as they were widely read in London's coffee houses. The role of translation was underscored by the editors themselves: a literal translation meant that the news pamphlets provided reliable accounts of foreign news and also saved editorial costs. Thus, translators, some of whom have fled from religious persecution in the continent, were hired. But, in England, as in other European countries, news pamphlets soon became an important concern for the government as it tried to curb political dissent. In the late 17th century, newspapers had to be authorized by the governments in countries such as England, France, and Sweden. In fact, in England, cabinet officials Robert Yard and James Vernon copied, translated, and compiled material for the *London Gazette* newsletters that had been gathered by envoys and agents.

Interestingly, the *Gazette* was also published in French as the *Gazette de Londres* and then distributed in the continent. The French version of the *Gazette* allowed the government to control the flow of information outside the British Isles. This translated pamphlet is a forerunner to contemporary news corporations such as *China Daily* and CTGN, both of which the Chinese government uses to disseminate news in several major languages such as English and French from a Chinese perspective, and the *Vietnam News*, an English-language newspaper funded by the Vietnamese government, which publishes translated material from local newspapers.

Journalistic Translation From the 19th Century to the Present Age

In the 19th and 20th centuries, the professionalization of the journalism profession affected the role and status of translation in news production.

However, interlinguistic transfer remained at the heart of the industry, particularly following the emergence of Europe's main news agencies: Havas, Reuters, and Wolff. Interestingly, these three companies had strong connections with the translation activities. Bureau Havas (later to become the Agence France Press), founded in 1832, operated as a translation bureau before becoming a full-fledged news agency in 1835. Havas translated British, German, Spanish, Italian, and Russian newspapers and sent them to other European cities. In a similar vein, Paul Julius Reuter, who had started working as a translator and did not have experience as a journalist, provided German bankers with commercial information before moving to London to start his own news agency. Finally, German doctor Bernard Wolff started working with Julius Reuter. He had been a translator of English and French medical books into German before founding Wolff in Berlin in 1848. Wolff disappeared after World War II following the demise of the Nazi regime, which had used it for propaganda purposes.

The technological advances in the late 20th century led to the revitalization of translation in news production and dissemination. Some corporations like the BBC had traditionally provided multilingual services in which translation was so crucial that the process has been referred to as factory translation. During the Cold War, the BBC and other Anglophone media such as the Voice of America had radio services in a variety of languages aimed at listeners living under dictatorial regimes. After the fall of the Berlin Wall in 1989 and the popularization of the Internet beginning in the 1990s, many of these services were revamped and other companies and news projects emerged.

In fact, in response to the BBC, the Voice of America, and other companies with services in English (as well as in other languages) such as CNN, news ventures appeared in other parts of the world. For example, in 1996, the Qatari government created the television channel Al Jazeera, after the BBC closed its service in Arabic. The Russian government funds the broadcast of television network Russian Today in languages such as English and Arabic. For its part, the European Community (now European Union) promoted the creation of Euronews, a European news channel whose objective was to offer a news service from

a European perspective. One of the many features of the project was that its programming could be watched in a variety of languages. The same applied to its website, which is currently available in 13 languages.

Role of Translation in Contemporary Journalism

In addition, national media such as *The New York Times* and Spain's *El País* select a sizeable number of the articles published in their original languages and translate them into other languages for international readers: Spanish and Chinese in the case of *The New York Times* and English and Portuguese in the case of *El País*. However, these translations are not literal: the journalists or translators adapt the material by selecting what should be translated, what needs to be added, and what needs to be deleted. In this sense, translation may function as a gatekeeping mechanism capable of creating different narratives for international audiences. In addition, translated articles are typically complemented with original material for the target readership. Apart from the services provided by national media for international speakers of other languages, some national media also offer services in other languages for domestic audiences. For instance, the *Miami Herald* has a Spanish version for the large Spanish-speaking community in the area.

Translation has remained crucial in the case of foreign correspondents, who have always needed reliable interpreters to obtain their material. In situations of conflict, journalists depend on the so-called fixers to provide accurate translations, while in other cases translation occurs when, for example, a Spanish journalist working for *El País* interviews a Kosovan leader in English. Then, the interview needs to be translated for the Spanish target readership, and language transfer occurs once again if the interview is selected for the English version of the Spanish newspaper. In addition, national media have formed international alliances to share material, which is usually indicated by attribution—for example, Spain's *El Mundo* typically indicates if a specific article was originally published in Britain's *The Guardian*. An international media alliance was at the basis of the controversial publication of the confidential

documents by WikiLeaks, which subsequently became available in English (*The Guardian* and *The New York Times*), Spanish (*El País*), French (*Le Monde*), and German (*Der Spiegel*).

Finally, and in connection with these strategic media alliances, op-ed columns by prestigious authors circulate in different languages via translation. For example, Spain's *El País* publishes a selection of the op-ed columns by Paul Krugman, which originally appeared in *The New York Times*. Unlike other news texts, op-ed columns tend to have the name of the authors as well as those of the translators.

JUVENILE OFFENDERS, COVERAGE OF

Crime news makes up a large segment of journalistic reportage. Juvenile crime is of special interest because it can affect government policy and public perceptions of the nation's youth. Bundled into

this issue are people's worries about their own children, the fear that older people often have of younger people, fear and mistrust based on race, and a tendency toward sensationalism on the part of the news media.

Coverage of juvenile offenders includes broadcast, print, and online news stories of crimes committed by a minor (often defined as those age 16 and under, although the age of majority in the United States is 18). This coverage is affected by the routines of news gathering, which involve deadlines, reliance on official sources, limited time and space, and the rapid news cycle. This entry first discusses indications that news coverage of juvenile offenders is disproportionate to the level of juvenile crime in the United States. It then looks at legal issues for U.S. journalists and news organizations in the coverage of juvenile offenders.

Research has indicated that a disproportionate amount of child-related news coverage deals with crime and violence, with one analysis during the 1990s finding that 40% of newspaper and television coverage of children dealt with these topics. Yet beginning in the 1990s, there was a sharp decline in the juvenile arrest rate for violent crimes. According to the Office of Juvenile Justice and Delinquency Prevention, part of the U.S. Department of Justice, between 1994 and 2003, the estimated number of murders involving a juvenile offender fell 65%, to its lowest level since at least 1980. In 2016, the number of arrests involving juveniles was at its lowest since at least 1980.

News media organizations tend to overreport crime cases involving female juveniles and tend to cover juvenile crime episodically. They focus on individual crimes as isolated events instead of reporting the important context of overall trends. Major events—such as shootings or other violence in schools—tend to receive heavy coverage.

News coverage of juvenile offenders also connects race and crime, particularly violent crime and especially on television. Pictures of African Americans or Latino youth dominate portrayals of youth violence, especially broadcast or photographic visual images. These portrayals have been shown to lead many who consume such news to worry more about their own safety. Television coverage of African American and Hispanic youth offenders raises levels of fear

among viewers, increases their support for more stringent crime policies, and promotes racial stereotyping.

Between 1985 and 2010, the arrest rates for African American youth were substantially higher than the rates for other youth across all offense categories. Additionally, National Relative Rate Index data show that there is more disparity for African American youth at arrest, detention, and waiver to criminal court than at other stages of the juvenile justice system. Furthermore, minority youth accounted for 75% of juveniles held in custody for a violent offense in 2010. Researchers have pointed to multiple reasons for racial disparity in juvenile arrests and treatment in the courts, including differences in childhood risk factors as well as implicit or explicit bias in the juvenile justice system.

In the 1960s, the U.S. Supreme Court decided a series of landmark cases that changed the character and procedures of the juvenile justice system. In 1966, in *Kent v. United States*, the Court listed several factors for judges to consider when deciding whether to transfer a juvenile case to adult court. This included the alleged seriousness of the offense. It was at this time that juvenile courts became more concerned for the interests of the juvenile. To this point, youth offenders were rarely afforded the legal protections usually granted to adults (such as the right to counsel). Most states limited news access to juvenile courts, largely to protect offenders from a life-long stigma for what was often a single mistake. Journalists followed suit and became less likely to run stories culled from the juvenile court system. News organizations and journalism groups counseled caution in identifying juvenile suspects of crime.

States vary on their access to juvenile record information. The following states fully protect juvenile record information from public accessibility: California, Nebraska, New York, North Carolina, North Dakota, Ohio, Rhode Island, and Vermont. Delaware, Georgia, Nevada, South Carolina, South Dakota, and Wyoming provide media access to juvenile record information only in certain circumstances. In states that limit access to juvenile proceedings, news media cannot be penalized for revealing a juvenile's identity if they lawfully obtained the information.

Some examples of how the media has been affected by juvenile offender laws, as reported by the Reporters Committee for Freedom of the Press, include the following:

- In 2012, a Kentucky judge granted a local newspaper's request to unseal records in a juvenile sexual abuse case that sparked widespread support for the victim after she publicly identified her alleged attackers.
- In 2010, a public records mediation office in Tennessee ruled that statements made by juveniles who are neither victims nor being charged with an offense are part of the public record and must be released upon request.
- In 2007, Ohio's highest court ruled that a judge violated state court rules when he prohibited the media from photographing a juvenile murder suspect's face without an evidentiary hearing.
- In 2007, replying to a lawsuit filed by a coalition of U.S. media companies, the judge overseeing the trial of Mychal Bell, one of the teenage defendants in the racially charged Jena 6 case in Louisiana, opened the juvenile's trial to the public.
- In 2005, a Missouri appellate court ruled that "adjudicatory" hearings in juvenile court must be open to the media in some circumstances, although the court offered no definition of what those circumstances are. The ruling stated that Missouri law provides for public access if the child is accused of conduct which, if committed by an adult, would be considered among the top two classes of felonies.
- In 2006, a Kentucky Press Association case challenging the constitutionality of four laws that would have limited public access to juvenile court proceedings was dismissed because the state courts had not interpreted the law.

Coverage of juvenile offenders can have an effect on public policy as well as individual perceptions of criminal reality. Journalists covering court cases involving juvenile offenders need to stay up to date with the relevant laws governing such coverage in their own state or community. Further, the amount of news coverage allowed is often up to individual court or judge discretion.
